## Definition

Financial management for local government is the system by which financial resources are planned, directed, and controlled to enable the efficient and effective delivery of public services at the local level.

## Introduction

Local governments around the world are responsible for a wide range of public services. They include but not limited to planning, education, transportation, social services, police, fire, waste disposal, recreational facilities, and economic development. Today local agencies are increasingly faced with the need to efficiently plan and deliver these services with scarce resources. The service planning and delivery cannot exist without the financial management system that provides resources and measures performance. Local governments rely on sound financial management to efficiently operate and provide essential services to the public. As the citizens are demanding more accountable and transparent use of the resources, financial management has become one of the most crucial functions of local governments.

In general, financial management is the subset of management that provides financial information that can be used in policy and decision-making (Finkler et al. 2017). Being free of value judgments, the financial information helps the organization to make decisions. In the business world, financial management is generally concerned with planning, organizing, directing, and controlling the financial activities such as procurement and utilization of funds. Public financial management takes advantage of the business managerial principles and tools and applies them to decision-making. For local governments, financial management serves to various organizational and service goals while maintaining satisfactory financial situation (Finkler et al. 2017; Steiss and Nwagwu 2001). In this context, financial management for local government is the system by which financial resources are planned, directed, and controlled to enable the efficient and effective delivery of public services at the local level.

The practice of public financial management is critical in "combating corruption, alleviating poverty, and ensuring the effective use of internal and external resources" (Shah 2007, p. xiii). Transparent and prudent local financial management is regarded as key to the integrity of the local government and for gaining and retaining the public trust. Such integrity and trust are sometimes lacking in local governments in developing countries (Shah 2007; UN-HABITAT et al. 2007). Even in regions with much advanced public

finance systems, such as North America and Europe, local governments are challenged with the growing service needs, limited resources, and policy constraints. The pressure persists that asks local governments to reform their financial systems by prioritizing objectives and controlling costs.

This chapter attempts to provide a broad perspective of financial management for local government. It introduces the core concepts and general framework of financial management at the local level. The conceptual frameworks are mostly developed based on the examples of North American or European countries, but they may indicate the situation and trend of, and give suggestions to, other countries around the world.

## Basic Functions of Local Financial Management

The primary objectives of financial management are quite simple in theory: to maximize benefits for given set of resources. It indicates a relatively straightforward process in which one needs to decide what are wanted, measure these goals and objectives, and then apply the tools available to achieve the greatest possible value of these goals and objectives (Steiss and Nwagwu 2001). However, the financial management in practice is complex and is relevant to almost every aspect of the local government operation (Pyke 1998). It encompasses the process and techniques to link many functions of policy making and administration, including resource inputs and service outputs, financial responsibility and financial accountability, and the management processes of planning and control. Experts have devoted their works to the topics of significant components of local public financial management. These topics include but are not limited to cash management, internal controls, budgeting, auditing, debt management, and purchasing and contracting practices (Finkler et al. 2017; Pyke 1998; Shah 2007; UN-HABITAT et al. 2007).

The purpose of the summary here is to provide broad overview of the components of financial management. The discussion is developed based on the three basic cycles of financial management as defined by Steiss and Nwagwu (2001): cash management, financial planning, and management control.

### Cash Management

Cash management in local government can be defined as the strategy and associated processes for effectively managing the short-term cash flows and cash balances (Williams 2013). As mentioned above, one of the most common challenges for local governments around the world is to have enough financial resources to fulfil their core functions. The revenue scarcity makes it more critical to local government to have effective cash management. The basic objectives of cash management are commonly understood as to have "the right amount of money in the right place at the right time to meet government obligations" (Storkey 2003, p. 1) and meanwhile, to maximize the effective use of resources and minimize the costs. In the other word, cash management is to maintain a sufficient cash balance to meet the day-to-day organizational needs in the most cost-effective way (Steiss and Nwagwu 2001).

Cash management involves analyses of revenues and expenditures, financial analysis of the utilization of assets, short- and long-range forecasts of resource needs, cash mobilization, and formulation of short-term investment strategies (Steiss and Nwagwu 2001). The primary activities of the cash management function are to collect revenues, pay the government's operating obligations, invest funds if they are not needed for current use, and safeguard the cash flow cycle.

There is a variety of revenue sources for local governments due to their differences in institutional and financial structures. In general, most local authorities have two categories of revenues: (1) own-source revenues as those raised locally by taxes, fees, charges, and fees and (2) intergovernmental revenues consist of those from other governments (usually higher level of

governments) including grants, shared taxes, and loans and advances. The relative inelasticity of local revenues, economic fluctuations, and the growing service needs are creating an ever-widening "fiscal gap" for many local governments (Steiss and Nwagwu 2001). To fix this gap, local governments need to reform their cash management systems to make the process more efficient and accountable, by ensuring that the government's cash balances are known and managed properly (Miller and Hadley 2016).

### Financial Planning

In order to accommodate the potential risk and uncertainty, financial management requires effective planning facilitated by analytical techniques (Steiss and Nwagwu 2001). Budgeting is the most important and widely adopted financial planning tool for local governments around the world. A well-established budgeting process incorporates strategic planning initiatives and effective analytical techniques. In a typical budget cycle, the priorities of spending are identified and related to reliable revenues during the budget preparation and enactment. The implementation of budget is then followed by audit or other similar evaluation processes. Budgeting decisions are driven by mission priorities, political considerations, and fiscal accountability.

Besides the relatively short operating budget cycles (usually 1 or 2 years), local governments are also responsible for long-range financial plans of capital projects. The long-range planning encompasses the financial analysis and strategies to assess the long-term implications of capital improvement needs, cost of services, cash flow, and investment activities. Cost-benefit and cost-effectiveness analysis techniques are effective tools in these planning practices (Steiss and Nwagwu 2001).

Capital projects require a comprehensive approach in their planning, operating, and debt administration. Debt administration is another important component of financial planning. Debt administration refers to the management of funds for the construction or acquisition of fixed assets, usually through capital improvements. It is common to finance capital projects by long-term borrowing. The long-term borrowing involves the issuance of bonds or other long-term obligations, from the public or from the intergovernmental grants and transfers. The abovementioned financial planning functions are interrelated and should be considered when developing policies and procedure of local finance management (UN-HABITAT et al. 2007). A sound long-range planning seeks to develop a proper mix of multiple financing methods and planning tools.

### Management Control

Management control is a critical dimension of local financial management that ensures its efficiency and integrity. Accounting for local government is not only an approach of record-keeping and external reporting but also the key function of management control (Steiss and Nwagwu 2001). Although the statutory and regulatory basis of accounting varies from government to government, the role of accounting is expanding with the worldwide trend in recent years of more transparent and accountable financial management. Management control can be achieved by a number of accounting tools. The two most traditional ones are financial accounting and managerial accounting (Finkler et al. 2017).

Financial accounting primarily focuses on accurate and objective recording of fiscal transactions and on preparing financial reports that reflect the financial position of the organization. Financial accounting is more concerned with external reporting that is constrained by particular forms and procedures. For example, in the USA, Governmental Accounting Standards Board (GASB) sets up the generally accepted accounting principles (GAAP) which are uniform minimum standards used by state and local agencies for financial recording and reporting. The outputs of financial accounting may be used for future plans, such as the operating budget.

Managerial accounting refers to the internal reporting that produces operational information for day-to-day planning, monitoring, and control. It is designed to provide internal managers with accounting information needed to plan, direct, and control operations. Managerial accounting produces financial information that internal managers can use to improve the future operations of the

organization. Financial accounting meanwhile provides retrospective information about the results of the operations and financial position of the organization (Finkler et al. 2017). Local agencies spend considerable time and effort to produce financial reports for both internal and external users. However, due to the lack of financial experience or training, there is a wide range of the level of understanding within the user groups (Pyke 1998).

## Conclusion

Public financial management forms an integral part of the development process of good governance and shared prosperity at the local level. Although the most of the discussions above are based on local financial management systems in the developed countries, the academic and practical implications go beyond these countries because financial stringency is a universal challenge. For instance, critical examination of the financial management systems in the Nigeria's local government indicates that there are a number of challenges affecting local governments there as are in many other developing countries. These challenges range from institutional constraints to resource scarcity and from corruption to the lack of adequate technical capacity of financial management (Eze and Harrison 2013). To combat these challenges requires governments to embrace practices of fiscal discipline, allocative efficiency, and operational transparency and accountability – the fundamental aspects of financial management.

Today decentralization reforms and strategies are being implemented worldwide to improve service delivery, economic governance, and citizen participation. Public financial management reforms are vital to attaining the benefits of decentralization because they manage the financial resource that is the lifeblood of public services and governance. As suggested by UN-HABITAT (2007), to ensure the accountability to higher levels of government and their constituents, local governments in their financial practice should also follow the principles of equity and inclusiveness and sustainability. Financial decisions are made in the best interest of all citizens rather than the privileged few. Sustainability should be integrated into financial management, especially the long-range planning and control, of local development.

# Financial Performance: The Simplification of Indexes

Massimo Bianchi[1] and Joshua Onome Imoniana[2]
[1]Department of Management, University of Bologna, Bologna, Italy
[2]University of Sao Paulo, Sao Paulo, Brazil

## Synonyms

Healthcare institutions; Perceived performance; Performance evaluation; Performance indexes; Simplification of control processes

## Definition

The simplification in healthcare organization (HO) control systems is a process of reducing indexes used to control the staff performances without impoverishing the quality of outputs and maintain, with an appropriate structure of parameters, an appropriate governance. This can be realized reducing existent indexes to three basic typologies and using their interdependencies to distinguish the perceived performance from the real ones.

## Introduction

The Healthcare Institutions introduced, with unsatisfactory results, different kinds of control and evaluation systems to improve their performances. At the same time, HO have to bear an increasing demand of simplicity from citizens but also from their own in which the diffused implementation of control systems contributed to the increasing of complexity. This complexity produces in managers the perception to have less control of structures and processes. A way to the simplicity is the introduction of a set of basic typologies like efficacy (Ec), efficiency (Ez), and adequacy (Ad) and using their interdependencies to distinguish the perceived performance from the real ones. Each HO has its margins of simplification that can be evaluated in advance before undertaking appropriate actions to restructuring the control process and evaluate performances in a correct way.

The simplest structure of a managerial process from a governance point of view can be designed as composed by four elements, objectives, resources, processing, and results, and the basic set to evaluate the staff performances produced consists in three indexes Ec, Ez, Ad, identified as relationships among process elements (Fig. 1).

The figure shows the elements (objectives, resources, processing, and results) and indexes (efficacy, efficiency, and adequacy) of a managerial process.

In 1978 Cameron (1978) identified more than 130 indicators used to evaluate organizational process in HO and proposed a simplification summarizing them into 9 independent dimensions. The following debate did not produce a real simplification of the performances' measurement concretely applied in organizations.

The economic turmoil of last years and the need to maintain the quality of life without an increase of public spending contribute to the renewal of the discussions on performance indexes flourished in 80s years (Carter 1989; Hood et al. 2003) and motivate the search of a more simple paradigm in the design of control systems (Aucoin and Heintzman 2000).

A particular interest was dedicated to the governance of Healthcare Institutions (hospitals, clinics, companies delivering primary and specialist assistance) in which the results of the process affect directly on persons and have ethical relevance as it concerns the quality and quantity of cures. Moreover, the results of this evaluation system could contribute to a correct evaluation of staff performances and consequent distribution of incentives.

One concrete perspective of simplifying the performance evaluation and control systems applies a set of indexes based on typologies of Ec, Ez and Ad (Bianchi 2019). These three typologies are formerly indicated in legislations on control systems of PA (Knill 2001), but their diffusion is quite unbalanced and differently applied (Giddens et al. 2008) although prefigured by medical researchers (Brian 1982).

**Financial Performance: The Simplification of Indexes, Fig. 1** Elements and indexes of a managerial process

## An Essential Set of Indicators

Terms like efficiency, efficacy (or effectiveness), and Ad return into the discussions on the strategy although some authors proposed to abandon any further analysis on these topics (Cameron 1980, 1986) and others show a meaningful skepticism (Barach and Small 2000). This orientation is not a novelty. In the prediction of changes in psychological treatment, the Ec ratings have been questioned (Bandura 1984) and their usefulness deeply discussed (Eastman and Marzillier 1984). In the same way the theory on planned behavior (Krueger and Carsrud 1993), despite critics on quantitative methods, expressed the need of models well-grounded in the practice but theoretically correct. Recent researches on organizational behavior and managerial control (Miner 2005) resumed the subject, underlining the existence of a complex theory-based system of indexes related to "the real world of actual individuals and organizations and focused about understanding the way they could be better" (Potts 2007). At the same time, researchers demonstrated the interaction between performance measures and individuals' performances in organizations (Dummond 1994) with the request for organizations to focus their attention on Ad, Ez, and Ec (Silverman 2000).

This rethinking implies some theoretical assumptions.

Each step in the managerial process of public organizations can be evaluated in a qualitative or quantitative approach. The quantitative one is linked to the measuring of process elements.

Seemingly, the qualitative evaluation is the simplest one to introduce and apply, but it leads to results quite difficult not only to compare among different areas or units (Dahlgaard et al. 2011) but also in order to understand progresses in the middle- and long-term period, a period particularly relevant to orient governance decisions. Furthermore, despite the proposal of new qualitative concepts like virtuousness and appropriateness (Cameron et al. 2004), the complication which affects and de-potentiates control systems in HO unabatedly it has increased.

The gap between the theory and the practice of performance measurement is connected with the difficulties of performance control and of related corrective actions (Mourik 2008). Owing to this process, the absenteeism and demotivation continue to be diffused in Healthcare Institutions with a decreasing quality of services and citizen perception. In organizations affected by this crisis, the managerial control systems have to choose (1) the parameters to be detected and used and (2) the methods to measure it in a quantitative approach and a simplification perspective. Table 1 gives an example of main parameters and indicators used in HO. It shows how this list could be differentiated and how its applying could produce many data about many different subjects.

To avoid controlling too many things, and therefore nothing, the advice is to limit the number of parameters (Flamholtz 1999) with a reference to the performance detected by objectives (or expected results), resources, and effective results.

In this way it is possible to define the main indexes as Ec and Ez. The Ec can be determined as the capability of an individual, an office, or an

**Financial Performance: The Simplification of Indexes, Table 1** Some parameters of performance in HO control systems

| Regarding treatments realized |
| Regarding material consumption |
| N° of organizational units involved |
| N° of external units involved |
| N° (or hours or participants) of meetings dedicated to coordinate the process |
| N° of citizens, patients, users |
| Lead time of the treatment process |
| N° (or hours) of service interruptions |
| N° of failures in the delivery of services |
| N° of complaints or nonconformity reports |

organization as a whole, to fulfill objectives or to make effective results comparable to expected ones. It is quantified by the ratio:

$$\frac{\text{Results}}{\text{Objectives (Decided or Scheduled)}} \quad (1)$$

The Ec is concretized on the ground by different typologies:

- Progress of work
- Fulfillment (or accomplishment) ratio
- Punctuality

It can be calculated also as the ratio of spending budget comparing:

$$\frac{\text{Level of Budget Spending}}{\text{Budget Available (or Assigned)}}$$

The Ez is concerning the transformation process and chiefly the ratio:

$$\frac{\text{Results}}{\text{Resources}} \quad (2)$$

The Ez question is: How can the maximum of results be obtained with a minimum of resources? It represents the so-called technical Ez in opposition to allocative Ez examined in the next pages (Allen and Tommasi 2001). Practically Ez is represented by concepts like:

- Productivity
- Hourly output
- Individual output
- Economy ratio
- Unitary cost

The unitary cost derives from the inverse of Ez as:

$$\frac{\text{Resources}}{\text{Results}} \quad (3)$$

Considering the relationships among the process components (Fig. 1), it becomes evident that the criticism on evaluation is based only on Ec and Ez.

The figure shows the interdependencies among objectives, resources, and results and the emergency of adequacy to complete the performance appreciation.

The structure of interdependencies summarized in Fig. 2 evidences the insufficiency of Ec and Ez to cover all three dimensions of the process performance expressed by the triangular interdependency among objectives, results, and resources. In this way it is highlighted the relationships between targets and resources as defined by the Ad (4).

$$\frac{\text{Resources}}{\text{Objectives}} \quad (4)$$

The evaluation of Ad in HO is connected with many present and relevant topics such as the sustainability and the feasibility, but it can be considered as an expression of quality and linked to ethical approaches to managerial decisions. The question linked to Ad evaluation is: Are the resources budgeted to fulfill programmed goals ethically correct?

Ad is linked to a strategic perspective not on the appropriateness or acceptability of resources

**Financial Performance: The Simplification of Indexes, Fig. 2** The interdependencies among parameters and the emergency of adequacy

employed to fulfill a result already obtained, but on the appropriateness and acceptability of resources available or programmed to fulfill the expected result.

The figure shows the formal interdependency among efficiency, efficacy, and adequacy.

The scarcity of available resources can lead to a more positive appreciation of healthcare managers, considering efforts they made to fulfil results with no adequate resources.

$$\mathrm{Ad} = \frac{\mathrm{Ec}}{\mathrm{Ez}} = \frac{\frac{\text{Results}}{\text{Objectives}}}{\frac{\text{Results}}{\text{Resources}}} \tag{5}$$

This integration will be quantified by interdependencies among Ad, Ec, and Ez (Fig. 3) calculated with Eq. (5). The implied relationship remarks the high connection existing among indexes and the relevance of operational problems in strategic decision-making about sustainability/feasibility (Devadoss et al. 2003). It underlines also the relevance of choices about concrete targets (and their measurable parameters) and implications regarding the managerial approach. This is highlighted by the use of a framework assessment concerning a hospital casualty unit (CU) (Table 2).

This relationship opens the way to the comparison between perceived and effective performances. The effective performance it derives from the ratio Ec/Ez (5), while the perceived performance comes from the personal evaluation of results with recipients like citizens and patients.

**Financial Performance: The Simplification of Indexes, Fig. 3** The integrated system for performance evaluation

The framework assessment evidences the impact on the unit governance of Ad perceived by the CU team and the users.

The perception of the governance relating to CU could overestimate the relevance of Ad comparing to its measure deriving from Eq. (5). In other terms, it can be more worried about the availability of posts offered by CU (the service efficacy) and not for the percentage of posts effectively used (the service efficiency).

In other terms, the HO strategical orientations can attribute more importance to the risk of scarcity of posts offered and not the limited use of CU posts. As it concerns the Ad perceived by CU users, surveyed by questionnaires, it can be lower than the one derived from Eq. (5) in which

**Financial Performance: The Simplification of Indexes, Table 2** A structured framework to assess performance parameters and indexes in a hospital casualty unit

| | | | Effective n° n° of staff available for CU service<br>Scheduled n° of staff available for CU service | Budget for extra salary and incentives for CU service<br>Effective n° of staff available for CU service | Budget destined to extra salary and incentives for CU service<br>Scheduled n° of staff available for CU service |
| | | | Effective reduction of acceptance time<br>Scheduled reduction of acceptance time | n° of staff mobile phones or a tablet PC integrated with hospital information system<br>Effective reduction of acceptance time | n° of staff mobile phones or a tablet PC integrated with hospital information system<br>Scheduled reduction of acceptance time |

the greater relevance attributes to Ec (the availability of posts) and the lower importance attributed to Ez (the ratio of posts effectively used) contributes in pushing up the derived value of Ad (Table 3, first row).

The opposite will happen if there is a scarcity of posts offered although the Ez is higher and the hospital satisfies most demands of hospitalization (Table 3; second row).

The World Health Organization proposes a set of indicators for comprehensive performance assessment in hospitals of regions and countries with different cultures and resource availability (Groene et al. 2008; Giddens et al. 2008). Data show a quite unbalanced proportion among typologies as Ec used in 49% of indicators, Ez 12%, and Ad 39%.

Although the criticism on these assessments (Chang 2007), the main limits concerning these indexes are connected to their complexity that generates in managers/users unclear perceptions and motivations (Runciman and Merry 2007).

This can be realized by reducing existent indexes to three basic typologies and using their interdependencies to distinguish the perceived performance from the real ones.

**Financial Performance: The Simplification of Indexes, Table 3** Perceived and derived adequacy

| Objectives | Resources | Results | | | | |
|---|---|---|---|---|---|---|
| Demand of CU posts | Offer of CU posts | Acceptation in CU | Ec (A/C) | Ez (C/B) | Ad derived (Ec/Ez) | Ad perceived (from users' questionnaire) |
| A | B | C | | | | |
| 50 | 100 | 50 | 1 | 0.5 | 2 | 3 |
| 100 | 30 | 90 | 0.9 | 3 | 0.3 | 0.1 |

## The Margins of Simplification

The wide and analytical diffusion of performance evaluation systems can be clearly attributed to Health Organizations and related processes of accreditation (Table 4).

The World Health Organization proposes a set of indicators for comprehensive performance assessment in hospitals of regions and countries with different cultures and resource availability (Groene et al. 2008; Adinolfi 2003) that can be analyzed using the three typologies Ec, Ez, and Ad. This set, compared with England and North America, despite the limits of this sample, shows a proportion among typologies quite unbalanced, Ec used in 49% of indicators, 12% Ez, and 39% Ad.

As it regards the margins for a feasible reduction of the complexity in evaluation systems based on parameters and indexes, a methodology for a reliable estimation derives from the comparison actuated above (Table 4).

The figure shows the number of indexes to be eliminated by the simplification in healthcare organizations: HSURC, Health Services Utilization and Research Commission; CIHI, Canadian Institute for Health Information; CCHSA, Canadian Council on Health Services Accreditation; JCAHO, Joint Commission on Accreditation of Healthcare Organizations; NHS, National Health Service, WHO, Word Health Organization.

Considering the reduction of indicators proposed for health organizations to one for each typology, Ec, Ez and Ad (Fig. 4), a significant estimation of the feasible simplification (Table 4) is outlined.

Table 5 contains the percentage of indexes in health organizations that could be eliminated in the hypothesis of reducing them to basic typologies of Ec, Ez, Ad where HSURC, Health Services Utilization and Research Commission; CIHI, Canadian Institute for Health Information; CCHSA, Canadian Council on Health Services Accreditation; JCAHO, Joint Commission on Accreditation of Healthcare Organizations; NHS, National Health Service; WHO, Word Health Organization.

Data derived from Table 4 with Eq. (6):

$$\frac{\mathrm{xij} - 1}{\mathrm{xij} * 100} \tag{6}$$

where i is the performance indexes and j = health organization and expresses the percentage of number of indexes proposed by each health organization exceeding the only typology to be used in the hypothesis of extreme simplification and divided by the number of indicators proposed.

## Conclusion and Perspectives

The simplification of indexes considered by HO governance implies a reduction of existent indexes to three basic typologies and using their interdependencies to distinguish the perceived performance. This process can be summarized in (1) individuation of relevant Ec, Ez, and Ad concrete typologies within a clear framework directly related to strategical objectives of the performance, (2) distinguishing the perceived performances from the real ones, (3) focusing the evaluation on real Ad and considering this last one for the evaluation and incentive of the staff. It would be an assumption that the HO staff tended to perceive the adequacy of the services as greater than the actual one while the citizens they may have an opposite feeling naturally, this

# Financial Reforms in Jordan

Diana AL-Fayez
University of Texas at Dallas,
Richardson, TX, USA

## Synonyms

Budget reform; Financial adjustment; Fiscal policy reform

## Definition

Financial reforms represent government efforts that aim to rationalize public spending and boost revenues in order to achieve financial stability and economic growth and improve the public sector efficiency.

## Introduction

Just as many other countries in the Middle East and North Africa (MENA) have done, Jordan has put financial reform on high priority as a way to achieve economic development and growth. Jordan implemented fiscal reform for the first time in 1989 following the financial bankruptcy that was triggered by the government's decisions during the period of 1982–1988. Over the past three decades, several steps have been taken in collaboration with the International Monetary Fund (IMF) and the World Bank, to decrease budget deficit and public debt. Although some of these reform efforts were successful, others faced many challenges and did not meet expected outcomes. This essay is divided into three sections; Section "Jordan: Brief Historic and Economic Backgrounds" is a brief history of Jordan and its economy. Section "Phases of Financial Reforms" reviews the phases of financial reforms in Jordan. Finally, section "Challenges in Implementing Financial Reforms" summarizes the challenges of financial reform.

## Jordan: Brief Historic and Economic Backgrounds

Jordan is a small country that is located in the Middle East and shares borders with Iraq to the northeast, Israel and West Bank to the west, Syria to the north, and Saudi Arabia to the south. The country is also strategically situated in Western Asia near to Africa and European crossroads. Before becoming an independent state in 1946, Jordan was a mandate of the British Empire which was the primary supplier of the budget until 1957 (Pillai 1982).

Unlike most other countries in the MENA region, Jordan is a small- and lower-middle-income country with few natural and financial resources. It also suffers from a limited size of its domestic market, a dominance of agriculture sector, high rates of population growth, unemployment, and poverty (Bader and Magableh 2009; Pillai 1982). This condition of economic scarcity has made the country rely on external resources to finance the economic development process and manage the continuing budget deficits. These resources include borrowing, foreign aid, remittances from Jordanians working abroad, and economic interactions with the regional countries (Bader and Magableh 2009; Saif and Omet 2005).

Jordan's dependence on borrowing and foreign aid dates back to the early days of the state. These foreign suppliers have changed significantly from the United Kingdom up until 1957 to the United States starting in 1958. After the regional oil boom of the 1970s, Jordan started getting more financial aid from some wealthy Arab countries such as Saudi Arabia and Kuwait. This in return helped in raising foreign aid from 26 per capita in 1967 to 257 per capita in 1976 (Bader and Magableh 2009; Harrigan et al. 2006).

In addition to the high level of Arab aid, the oil revolution opened the door to Jordanian's workers to access Gulf labor markets. It was estimated that nearly one third of the Jordanian's labor force was working in the Gulf by the early 1980s (Harrigan et al. 2006). These job opportunities boosted Jordan's economy through the official remittances which constitute a large percentage of the gross domestic production (GDP) (Ryan 1998; Saif and Omet 2005). The oil boom also increased the demands of Jordanian exports to the countries in the region; almost half of the country's exports were with the MENA region especially Iraq which was the main market for the Jordanian exports (Harrigan et al. 2006; Saif and Omet 2005). During that period, Jordan achieved one of the highest world GDP growth at an annual average of 11.6% in real term (Kanaan and Kardoosh 2002; Saif and Omet 2005).

Unfortunately, this economic growth that the country witnessed during the 1970s started to decline in 1983; this is because of the drop in oil price, which led to a deterioration in Arab aid and Jordan's exports. Moreover, the Jordanian workforce in the Gulf was sent home, and this in return led to a decline in their remittances. All these changes in the external environment caused the country to enter an economic recession. The country's economic indicators showed a structural imbalance in its macroeconomics; the Jordanian dinar fell from 3 dollars in 1988 to one and a half Dollars in 1990, and the unemployment rates increased as a result of low rates in economic growth. Moreover, the country witnessed some serious problems in its balance of payment and a decline in the central bank's reserves caused by the government's internal borrowing which, in turn, led to an increase in the fiscal deficit. Therefore, the Jordanian government resorted to external borrowing from international institutions such as the International Monetary Fund (IMF) to counter its budget deficits, compensate the fall in foreign reserves, and finance its economic development (Al-Refai 2015; Kanaan and Kardoosh 2002; Ramachandran 2004; Saif and Omet 2005). However, this assistance from international creditors was not without any conditions forced in exchanging the loans (Ryan 1998).

## Phases of Financial Reforms

Since 1989, Jordan has been on a journey of financial reforms as a part of its economic adjustment programs. Most of these programs

were guided by the International Monetary Fund (IMF) and supported by the World Bank in order to decrease public debt and budget deficit. They wanted to increase Jordan's ability in responding to the external environment changes and to ensure stability and economic growth. Based on IMF recommendations, the Jordanian government took several reform steps on both sides of the budget, expenditures and revenues, such as initiating some tax reform effort and reducing subsidies, as well as privatizing a number of public entities (Alam et al. 2017; Andoni and Schwedler 1996; Harrigan et al. 2006; Ryan 1998). These reforms were implemented in different phases.

The first reform effort was made during the government of Prime Minister Zaid al-Rifai in Mach of 1989. When the government was unable to pay its loan, it was forced to ask for help from the IMF and the World Bank in the form of loans and grants. On their part, these two creditors agreed to provide Jordan with approximately $225 million on a condition that the government implements an austerity plan (Ryan 1998). Therefore, a number of fiscal decisions were made on the side of public expenditures. The government lifted the petroleum subsidies and increased the prices for several goods such as cigarettes and hard and soft beverages. The government also froze public sector wages, salaries, and jobs (Andoni and Schwedler 1996; Harrigan et al. 2006; Ryan 1998; Wils 2004). However, this reform was faced by public opposition and brought on a lot of chaos within the country.

The second phase of financial reforms was implemented in 1994 under the government of Abdulsalam al-Majali. This reform effort was considered as one of the major steps that the government took in the 1990s to improve its financial situation. It was focused on improving the domestic revenue by introducing the general sales tax (Andoni and Schwedler 1996; Wils 2004). The law was passed with a 7% tax rate, and then it was increased to 10% in 1995 (Wils 2004). After that, the law was amended several times up until the tax rate stood at 16% in 2003 (Al-Shawabkah 2010).

In 1996, another major reform of Jordan's fiscal policy was made. This is when the government concentrated again on public expenditures by lifting the bread subsidies. The Jordanian government used to sell wheat, barley, flour, and bread at a subsidized price; in 1995 the number of governmental subsidies for the wheat product alone was $147 million (Andoni and Schwedler 1996; Ryan 1998). However, after the unexpected rise in the international wheat price from $175 to $280 per ton in 1995, the government of the Prime Minister Abdul Karim al-Kabariti had to make a hard financial decision that targeted bread subsidies (Ryan 1998). The government explained its decision by stating that maintaining wheat subsidies will dramatically increase the budget deficit (Andoni and Schwedler 1996). Within a few days of the government's decision, the prices of wheat products more than doubled, resulting in violent riots that were sparked first in Al-Karak city and then spread across the country. As a result, the government decided to support the citizens in order to compensate for the additional burden of the raised subsidies (Andoni and Schwedler 1996; Ryan 1998). These offsetting measures were provided to each eligible household as a subsidy of $ 1.80 per person per month (Andoni and Schwedler 1996).

It is worth mentioning that the Jordanian dinar was pegged to the US dollar in 1995. Although this decision was not part of the IMF agreement, the government saw it is an important step to protect the dinar and to avoid a currency crisis similar to what happened in 1989 (Harrigan et al. 2006). Today the exchange rate is fixed at approximately 0.709 dinar per dollar.

In order to attract more foreign investment and minimize the role of the state in economic activities, the Jordanian government adopted privatization, under pressure from IMF, as a policy that generates a structural change and directly boosts the budget (Shahateet et al. 2014; Wils 2004). Although the government started selling few of its shares in some public companies in 1989 such as Ma'in Hot springs and the InterContinental hotel, privatization officially began in Jordan when the government sold its shares in the Cement Company in 1998 and 40% of its

stocks in the Telecommunication Company in 1999 (Wils 2004). The privatization process, then, was accelerated after passing the privatization law in 2000, and the government sold 34 out of 40 of the state-owned enterprises (SOE) in different sectors by the mid of 2002 (Harrigan et al. 2006).

In 2000, the country witnessed an economic growth at a yearly rate of 4% (Saif and Omet 2005). Unfortunately, this growth did not last long and started to decline in 2004 as a result of the 2003 US-Iraq war. Iraq was the main market for Jordan's exports and the main supplier of crude oil at highly concessionary prices. The collapse of the Iraqi's regime led to an increase in the Jordanian budget deficit and external debt (Harrigan et al. 2006). The deficit jumped from 119 million JD in 2000 to 977 million JD in 2005, and the external debt rose from 5,043 million JD in 2000 to 5,056 million JD in 2005 (Shahateet et al. 2014). Moreover, the price of crude oil increased sharply resulting in a rise in the cost of energy subsidies. Therefore, the government had no choice but to implement more fiscal reforms that focused mainly on the graduate removal of the fuel subsides and liberalizing the energy sector over a period of 3 years. The first stage was in 2005 when the government increased the prices of petroleum products ranging from 10% for gasoline to 35% for power and industry. The second increase in the fuel prices was in April 2006, and the final stage to eliminate energy subsidies was in 2008 when most of these subsidies were removed (Fattouh and El-Katiri 2012).

At the end of 2008, the performance of the economy declined dramatically due to the global financial crisis. This downturn had a negative effect on both tax revenues and external aids, resulting in declining public expenditures and introducing more financial reforms (Alam et al. 2017). The government, then, approved two tax laws in 2009, a new Income Tax Law (No. 28) and an amended Sales Tax (No. 29) (Shahateet et al. 2014).

Despite the success of the subsidies elimination plan, the government decided, in 2011, to reverse some of its reform efforts due to demonstrations against rising unemployment and cost of living. This was also combined with the sparking of the Arab Spring in 2010 (Fattouh and El-Katiri 2012). However, the government resumed the implementation of eliminating fuel subsides in 2012. Moreover, electricity tariffs increased starting in June 2012 and have reached up to 15% for selected consumers.

As a part of the three plans with the IMF, the government of Hani AL-Mulki increased the sales tax rate, removed bread subsidies, and submitted a draft for new tax law that caused nationwide protest, resulting in the resignation of the government. More recently, the current government pushed ahead and approved the new tax bill after a series of amendments that protect the poor and middle class.

## Challenges in Implementing Financial Reforms

Jordan's efforts in financial reforms were not easily accomplished, and they came with social and political costs. A number of challenges make the implementation and efficiency of these reforms a difficult task. One set of challenges relates to the socioeconomic impact of reforms. There is no doubt that poverty is considered one of the most critical issues that face the state alongside unemployment. Therefore, policymakers must be careful and strike the right balance between financial returns and compensation levels. However, some of these fiscal reforms imposed cuts in socially sensitive spending (food and petroleum subsidies) that people benefit from. The lifting of subsidies combined with price increases doubled the burden on the poor. Moreover, the fiscal reform included freezing all recruitment in the public sector which is considered to be one of the largest absorbers of the workforce. This resulted in reducing job opportunities for the increasing number of graduates (Nazzal 2005). Therefore, there were strong domestic oppositions to the government austerity plan from the population who have suffered from high poverty and unemployment rates. This public anger was translated in terms of riots like

what happened in 1989 and 1996 (Wils 2004), and lately, mass protest against tax increase led to pushing out the government of Hani Al-Mulki.

Another major challenge facing the financial reform in Jordan has to do with political instability. The country is situated in a volatile and complex region, and its economy is closely related to some countries in the region. Over the three past decades, Jordan's economy and fiscal reform were vulnerable to the regional political circumstances, starting with the Gulf War that took place at the beginning of the 1990s (Harrigan et al. 2006) to the 2003 US-Iraq war and, lately, the Arab Spring that sparked in 2010 and the influx of Syrian refugees (Alam et al. 2017). These events through the years have placed additional internal and external pressures that necessitate further change and reform to enable the Kingdom to respond adequately to these changes and to ensure stability and economic growth.

Additionally, powerful economic networks within the country have also been a challenge. According to Wils (2004), the private sector elite have a huge effect on the fiscal reforms in Jordan; they manipulate these policies and redistribute public revenues and goods in ways that protect their privileges. These business elites, in addition to some senior civil servants, collaborate to stop or even postpone most of the financial decisions that are threatening their social status and privileges.

## Conclusion

Reaching the end of this discussion, it is clear that Jordan has a long history with financial reforms going all the way back to 1989. Over the past three decades, the government of Jordan collaborated with both the IMF and the World Bank to reduce budget deficit and public debt, ultimately wanting to achieve financial and economic stabilization. These reforms were implemented in different phases; some of them were successful, while others did not achieve their goals. In order to secure the IMF loans, the governments of Jordan throughout the years have made dramatic decisions such as eliminating bread and petroleum subsidies, increasing taxes, and freezing all jobs, salaries, and wages. However, most of these decisions encountered public opposition and brought a lot of chaos. In order to survive and robustly confront the challenges they encounter, Jordan must review the implementation of IMF's programs and set national economic plans that don't neglect the sociopolitical dimension of the reform. The government is also called upon to step up and strike the right balance between financial returns and the growing demands of their citizens. It also should learn from the experience of other countries in terms of economic and financial growth.

# Financial Reporting

Mark Christensen
ESSEC Business School, Cergy, France

## Synonyms

External accounting; (Loose) annual reporting

## Definition

Financial reporting is the process by which goal-seeking organizations provide an external audience with accounting reports on the organization's financial performance, financial position, and its sources and uses of cash with respect to a defined financial period or at the end of a financial period.

## Introduction

Financial reporting is one of the core functions of accounting in all goal-seeking organizations, including public sector organizations. Accounting is a fundamental contributor to management and operation of organizations together with other functional tasks such as marketing, human resources management, legal services, information technology, and so on. The function of accounting can in turn be classified into two main categories: management accounting and external accounting which in turn consists of preparation of financial statements and reporting of same. In this entry, the following issues are considered in their public sector contexts: purposes and boundaries of financial reporting, relationships with other aspects of the accounting function, the performativity of financial reporting, and recent trends in public sector financial reporting.

## Purposes and Boundaries of Financial Reporting

The purposes of financial reporting are best considered with two different but related lenses: first, what regulatory constraints shape the reports? And second, what are the information needs of the audience of public sector financial reports? However, in both, it is important to begin with the realization that the distinguishing feature of all public sector financial reporting, as opposed to private sector reporting, arises from "the principle of *democratic control over the use of funds*, made critical by the coercive ability of governments to raise finance through taxation" (Pallot 1992, p. 39). That principle directs financial reporting to both an accountability purpose and a user's need for decision-useful information while providing an orientation that is necessarily different to a private sector organization's financial reporting.

The regulatory framework can be different across each sovereign government or each level of government (such as local or regional government within a sovereign nation's system of constitutional arrangements). Nevertheless, an important feature of financial reporting is that it exists within a regulatory framework with some degree of compulsion over the reporting agency

(Barton 2005). Frequently in a public sector context, that compulsion is exerted through a public shaming of agencies that do not comply with the reporting regulations. Typically, a Supreme Audit Institution is constituted within administrative or regulatory frameworks so as to conduct audits of public sector financial statements and their compliance with the prevailing regulatory framework. Audit findings of noncompliance can have deleterious impacts on politicians' and administrators' reputations and have been shown to have significant impact (Radcliffe 1997; Skærbæk and Christensen 2015). This feature of financial reporting makes it distinct from management accounting where internal users, such as managers, have greater flexibility as to format, timing, and content of the reports they produce for internal, confidential purposes. While the financial reporting regulatory framework will vary from nation to nation, it frequently has the same underlying principle: in attaining its various powers such as the right to levy taxes and to expend funds, democratic governments also necessarily acquire accountability obligations. Thus, the regulatory lens from which to view financial reporting frequently invokes an accountability purpose as was noted as early as 1987 when the Governmental Accounting Standards Board of the USA stated: "Accountability is the cornerstone of all financial reporting in government" (1987, quoted by Pallot 1992, p. 40).

The second lens with which to consider public sector financial reporting is constituted by the needs of the audience. Interestingly, the official pronouncements on users of public sector financial reports focus primarily on citizens and taxpayers with a "need to know" (hence the concept of accountability as discussed above within a regulatory reporting framework) or a need to make decisions (hence a decision-usefulness purpose for the financial reporting). The most comprehensive pronouncement on these matters is found within the International Public Sector Accounting Standard Board's (IPSASB) Conceptual Framework and the body of International Public Sector Accounting Standards (IPSAS) (IPSASB 2016). The IPSAS's have increasingly become a point of standardization (Aggestam-Pontoppidan and Andernack 2016) even though they do not hold any force of compulsion (Manes-Rossi et al. 2016). After significant effort, IPSASB (under the auspices of the International Federation of Accountants) has developed the standards to a point where they constitute a coherent body aimed at improved financial reporting by governments and their agencies. Fundamental principles which elaborate reporting are provided within the IPSAS's, and they include a rationale underlying the preparation of financial statements, definition of a going-concern assumption, consistency of presentation and classification, accrual basis of accounting, and aggregation and materiality.

For quite some time, it has been recognized that an accountability frame may be incompatible with a decision-usefulness frame (Ijiri 1983). While decision-usefulness as a reporting paradigm has been on the ascendancy since the 1970s (Coy and Dixon 2004), there is little empirical evidence as to whether citizens use financial reports. In fact, the empirical evidence that is available leaves open the conclusion that public sector financial reports are used mostly by "internal users" (Coy et al. 1997; Steccolini 2004; Christensen and Skærbæk 2007) without much usage by external users (Mack and Ryan 2006) unless there is a financial market attached to individual entities such as debt-issuing governmental agencies (Hay and Antonio 1990). Steccolini (2004, p. 328) goes further to note that public sector financial reports are "seemingly used to discharge accountability to 'internal' users, even if it is not clear if they are actually read. At the same time, they have no significant role in communicating to external users."

## Relationships with Other Aspects of the Accounting Function

Given the disappointing empirical evidence regarding uses of public sector financial reporting, it faces a dilemma regarding its content. That dilemma is primarily around the relative content of the financial information to be reported – as

opposed to nonfinancial information that may also be reported. In large part the resolution of that dilemma is provided in the regulatory frameworks noted above, but it is also influenced by prevailing accounting profession reporting standards and pronouncements. Where nonfinancial data is to be reported, it is typically classified as being relevant to the outputs and/or outcomes of the relevant public sector performance being reported upon; for example, the numbers of hospital patients treated in hospitals provided by the Department of Health; the extent of repeat offending by citizens who had previously been sentenced to a period of incarceration for past criminal offenses as administered by the Department of Justice; and the quality of air impacted by an environmental protection program administered by the Department of Environment. Each of those examples of outputs or outcomes necessarily requires the consumption of financial resources, and so the cost element of the data will be captured in the relevant agency accounting system. Nevertheless, the recording of outcomes can be very controversial and with political consequences. Awareness of those possible consequences has been shown to have an impact on reporting agencies and auditors (Radcliffe 2008), and so it is a paradoxical finding that public sector financial reports lack strong use by citizens yet the fact that the reports are made available to the public can influence the readiness of public sector agencies to disclose information.

In addition to the relationship of financial reporting to nonfinancial information, there is a relationship with management accounting. As noted by many public sector accounting scholars, management accounting information on cost allocation and cost behavior will influence financial reports although much of that relationship can be mediated by the production of consolidated, whole-of-government reports where inter- and intra-agency transactions are eliminated. Where agency reports are the unit of analysis, the relationship of management accounting and financial reporting is one of symbiosis since the one both depends on, and influences, the other. While it can be said that financial reporting and management accounting are "attached at the hip" by the chart of accounts (in that classification of transactions influences both management accounting and the financial reports), a stronger more powerful relationship emerges from the nature of accounting as a representation of something. The representation presented by accounting is only one of a multitude of possible representations, yet the power of the single representation (Hines 1988) has been shown to preclude most other representations. Ideas, words, and numerical inscriptions contribute to the construction of the reality they describe. They are both outside the reality they describe, and yet at the same time they construct that reality by acting on it. That observation leads to a body of research directly connected to financial reporting (as well as other aspects of accounting) in that it links the humans who prepare reports and the humans who react to those reports – either knowingly or otherwise. As a general concept, this link can be discussed as part of the performativity of financial reporting.

## Performativity of Public Sector Financial Reporting

Performativity refers to an ability for statements, numbers, or other inscriptions to create reality. As an example of performative language, an absolute monarch could create reality such as removing a citizen's nationality by simply making a pronouncement to that effect; the pronouncement creates the reality that the individual is ostracized and henceforth a persona non grata (no longer a citizen). The performativity thesis (MacKenzie 2006) regarding accounting is that accounting numbers do not simply represent a past reality, but they may shape the future reality. An instance may be where a nation provides a consolidated financial statement which indicates a solvency problem which in turn causes markets to restrict debt funding and so worsen solvency. Although performativity has been ascribed to management accounting and interaction of accounting with strategic action on an organizational level, it is also apparent that financial reporting possesses a performativity of its own. Instead of being mere signs of the past, financial reports can be signals of

the future, and they can also be signals as to motivations of the reports' preparers (Vollmer 2016).

There is controversy in the performativity argument around how financial reporting moves from being a camera (or a sign) to being a machine (or a signal). First, it runs counter to the functionalist view of accounting as a passive device without social consequences. Such a view might argue that the actions of actors who have considered the financial reports are not passive but that the accounting system producing those reports is a function without social consequences. Further, performativity as a thesis needs empirical support; such support is now present in the management accounting literature, but if public sector financial reports are not used by external users, is it possible to argue a performativity consideration? Performativity theory has been persuasive in regard to explanations of carbon trading, Black-Scholes valuation of options, Results-Based Accountability, and risk management within reporting entities. However, the performativity of public sector financial reports remains to be fully explored by researchers. Nevertheless, recent trends in public sector financial reporting, briefly discussed next, point toward further justification to incorporate performativity in research projects aiming to better understand public sector financial reporting.

## Recent Trends in Public Sector Financial Reporting

Internationally, public sector financial reporting has been subject to widespread change. Since the advent of a suite of public sector reforms frequently referred to as "New Public Management" (NPM) (Hood 1995), accounting technologies have been characterized as enabling various reforms. Accounting information has frequently underpinned decision making analyses of reforms such as outsourcing, privatization, purchaser-provider intergovernmental relations, performance-based remuneration, performance budgeting, decentralization, market-based pricing, corporatization, balanced scorecard reporting, and similar changes. While reform at an organizational level has relied on management accounting information, it is at a macro-level of broad policy level that financial reporting has been relevant. That is, issues of indebtedness, asset management, intergenerational equity, intergovernmental financial transactions, and associated system-wide matters have drawn data from published financial reports. Within that general trend, it is possible to discern four major changes to public sector financial reporting: first, a move to private sector influenced accrual-based accounting (Barton 1999) as a replacement of cash-based accounting or as an additional set of information; second, a movement toward harmonization of public sector accounting standards initially on a basis that seemed to be global but more recently with regional bases; third, a tendency to expand the degree of non-accounting data such as performance data and managerial commentary to complement more traditional accounting data as found in the financial statement; and, fourth, a tendency to produce consolidated whole-of-government financial reports.

The most profound, and still largely unresolved, change in public sector financial reporting has been the move to accrual accounting. The importance of that change has been a shift from an expenditure basis of governmental accounting to capitalization and amortization of certain long-term assets, but as noted by Buhr (2012, p. 188): "many governments actually went through a cash, modified cash, modified accrual, accrual transition process." While that transition has been cemented via the non-compulsory body of IPSAS's, there is a large literature which can be best characterized as evidencing a discrepancy between practitioners and academics with respect to accrual accounting (Hassan 2013). An initial study of 130 contributions published between 1981 and 2005 showed that after implementation of accrual accounting in an early adopter jurisdiction, the volume of articles authored by practitioners waned, while the volume of articles authored by academics increased in number (Christensen 2007). Hassan (2013) has duplicated Christensen's earlier study with a longer period

of analysis (1980–2012) and confirmed a marked difference of opinion between academics and practitioners regarding various aspects of accrual accounting when applied to the public sector. The meta-analysis provided by Christensen (2007) and Hassan (2013) is useful in that it is clear demonstration that the trend to accrual accounting has some way to travel before stability and consensus is achieved. In fact it is important to acknowledge that changes in public sector financial reporting (and other aspects of accounting more broadly) have been the result of reforms in individual countries rather than compliance with a "trend" toward a common goal (Brusca et al. 2015).

Public sector accrual accounting and the other three trends noted above have significant implications for the purposes and boundaries of financial reporting in the public sector, and so the general topic of public sector financial reporting is likely be one of malleable future change.

## Conclusion

As publically available statements of financial performance, position, and uses of cash, public sector financial statements are positioned in an interesting conjunction of stability and change. Stability arises from the accounting craft, embedded in a longstanding profession with mostly unchallenged growing international importance. However, at the same time inevitable and relentless change is characterizing public sector financial reporting as recognition grows that accounting has a degree of performativity which means it is not just a passive representation of the past but instead is an active instrument in political and social change that potentially reaches into public policy settings. Similarly, the controversy continues as to who – if anyone – uses public sector financial statements and for what purposes. That controversy presents a challenge to the taken-for-granted premises regarding accountability and decision-usefulness that have previously been the foundations on which public sector financial reporting has been based.

## Synonyms

Financial reporting; General purpose financial reports; General purpose financial statements

## Definition

### Financial Statements

Financial information to provide a wide range of users with information useful for decision-making and to demonstrate accountability of the entity for resources entrusted to it.

## Introduction

The increasing global shift towards accrual accounting systems has clearly affected financial reporting practices in various countries and on different governmental levels. Together with these developments, the extent, purpose, and presentation of financial statements have changed in the past decade. The most important facilitator for these accounting reforms has probably been the promulgation and implementation of the International Public Sector Accounting Standards (IPSAS). IPSAS is the only generally accepted international accounting standard for public sector entities at the moment. The adoption of IPSAS can be therefore referred to as good practice. Many developed and developing countries or international organizations, including the United Nations and the Commission of the European Union, have implemented IPSAS. The recent completion of the IPSAS Conceptual Framework (IFAC 2015a) in 2015 established the concepts that underpin general purpose financial reporting by public sector entities, which adopted the accrual basis of accounting and it is an important step and prerequisite forward towards the continued global dissemination of IPSAS. Although the European Union is currently working on their own set of accounting standards – the European Public Sector Accounting Standards (EPSAS) – they remain far from issuing a final set of standards. Therefore, the IPSASs provide the most important reference point for preparing this chapter.

Following this introduction, this chapter will first focus on the general purpose financial statements as described and governed in IPSAS. Thereby, the relevance, importance, and constraints of general purpose financial statements

will be discussed, before considering the different components of general purpose financial statements more comprehensively. The presentation of financial statements in selected European countries will be the second step in this chapter. Finally, the key aspects with respect to general purpose financial statements are summarized.

## General Purpose Financial Statements

General purpose financial statements are considered to be a central component of general purpose financial reports (GPFRs) by governments and other public sector entities. Although one can easily understand that financial reporting mainly focuses on the presentation of financial statements, this does not automatically answer the "general purpose" of financial statements. Therefore, three main issues need to be addressed: What are general purpose financial statements there for, i.e., what is their main purpose? Who are the users which eventually base their decision on them? Which principles and characteristics shall these statements follow in order to achieve their purposes? The recently finalized IPSAS CF provides an important source to answer these three distinct questions. As discussed in other chapters of this book, IPSAS can be considered as international good practice in the area of public sector financial reporting and therefore represents a crucial reference to discuss the relevance, importance, and constraints of general purpose financial statements.

The first two issues will be considered together, as they heavily rely on each other. The objective of financial reporting by public sector entities and, as a main component, general purpose financial statements are to provide information about the entity that is useful to users for accountability and decision-making purposes. The purposes of financial statements are therefore determined by reference to the users and their information needs (IFAC 2015a, 1.4). It is therefore necessary in a first step to focus on the users of general purpose financial statements. Are these users the investors, the media, or perhaps the citizens? Basically, the right answer in the case of the IPSASs is: All of them. Consequently, the financial statements of public sector entities are developed for any general reader who does not have the authority to require the preparation of financial reports tailored to meet his own specific information needs. General purpose financial reports and statements must therefore be seen in contrast to special purpose financial reports and statements which are adjusted to meet specific information needs of specific user groups, as for example internal reports to mangers or special reports required by international organizations or rating agencies. Such reports do also not focus on budget preparation and authorization, as this would also constitute a special purpose only relevant for those parties involved (Bergmann 2008). The target group of such general purpose financial statements is thus a very broad one.

Governments and other public sector entities raise resources from taxpayers and other resource providers in order to provide public goods and services. These entities are accountable for the management and use of these resources for those that entrust them with these resources and to those that depend on public goods and services (IFAC 2015a, 2.3). Thus, the IPSAS CF defines two main distinct user groups of general purpose financial statements, namely, service recipients (primarily citizens) and resource providers (primarily tax payers, capital markets, donor agencies, international organizations). Both resource providers and service recipients (or those who expect to receive goods and/or services) as well as their representatives (any political or legislative bodies) require information for accountability or decision-making purposes (IFAC 2015a, 2.5). Consequently, general purpose financial reports and statements are developed primarily to respond to the needs of these two user groups. However, they may also provide information useful to other parties and for other purposes, such as government statisticians, analysts, the media, or lobby groups. While these parties may find the information in general purpose financial statements useful, they are however not considered to be the primary users (IFAC 2015a, 2.6).

For accountability and decision-making purposes, service recipients and resource providers

will need information that supports the assessments of such matters. In this context, it can be assumed the sole delivery of financial information in form of general purpose financial statements might not be enough to fully satisfy the information needs. The first and foremost objective of most public sector entities is to deliver services to the public, rather than to make profits and generate a return on equity to investors. As a result, the performance of such entities can be only partially evaluated by examining financial statements. Besides general purpose financial statements, GPFRs usually provide other types of reports which enhance, complement, and supplement the financial statements. Such reports may especially include nonfinancial information related to the range, volume, and cost of services provided during the reporting period. They can also include prospective information about the sustainability of the entity's service delivery and other operations over the long term. Although GPFRs traditionally include multiple reports to comprehensively meet user's information needs, financial statements can be considered a main and important source of information, which therefore justifies focusing more comprehensively on the objectives, qualitative characteristics, constraints, and components of general purpose financial statements.

GPFSs are a structured representation of the financial position, financial performance, and cash flows of an entity that shall support users in making a balanced decision about the allocation of resources. IPSAS 1.15 (IFAC 2015b) specifically outlines the main objectives:

(a) Providing information about the sources, allocation, and uses of financial resources
(b) Providing information about how the entity financed its activities and met its cash requirements
(c) Providing information that is useful in evaluating the entity's ability to finance its activities and to meet its liabilities and commitments
(d) Providing information about the financial condition of the entity and changes in it
(e) Providing aggregate information useful in evaluating the entity's performance in terms of service costs, efficiency, and accomplishments

As described above, general purpose financial statements usually focus on retrospective information covering economic transactions which have taken place in the respective reporting period. However, general purpose financial statements can also take a prospective role, thereby encompassing information useful in predicting the level of resources required for or generated by continued operations including associated risks and uncertainties.

In order to achieve the main objectives, general purpose financial statements prepared and presented under IPSAS have to observe distinctive qualitative characteristics, which are outlined in chapter 3 of the IPSAS CF. All these qualitative characteristics build the core requirements of accrual-based accounting, aiming to present a faithful and comprehensive picture of government's finances. The qualitative characteristics apply to both historic and prospective information and explanatory information.

These qualitative characteristics assign responsibility to the reporting entity, which has to formulate and impose accounting policies ensuring that general purpose financial statements comply with those characteristics. The qualitative characteristics include two distinctive groups. A first group represents positive characteristics that will improve financial reporting when observed. These are (1a) relevance, (1b) faithful representation, (1c) understandability, (1d) timeliness, (1e) comparability, and (1f) verifiability. A second group imposes specific constraints on information included in general purpose financial reports/statements. These are (2a) materiality, (2b) cost-benefit, and (2c) balance between the qualitative characteristics. In practice, there is a constant trade-off between the characteristics of the two groups and not all qualitative characteristics may be fully met. As a result, depending on the particular case, a balance between certain characteristics is necessary.

So far, many crucial aspects of general purpose financial statements – such as their primary users and purposes as well as their qualitative

characteristics – have been discussed. What is missing, however, are the different components of general purpose financial statements, or to put it differently, the distinct instruments which shall be prepared according to IPSAS to encompass the relevant information in order to meet user needs and objectives. According to IPSAS 1.21 (IFAC 2015b), a complete set of financial statements comprises:

(a) A statement of financial position
(b) A statement of financial performance
(c) A statement of changes in net assets/equity
(d) A cash flow statement
(e) When the entity makes publicly available, its approved budget, a comparison of budget and actual amounts either as a separate additional financial statement or as a budget column in the financial statements
(f) Notes, comprising a summary of significant accounting policies and other explanatory notes
(g) Comparative information in respect of the preceding period

The following sections do focus on the most important components of financial statements, both by explaining the core logic of these instruments and offering sample statements. However, the author refrained from an in-depth explanation of the budget comparison and the prospective information section, because other chapters of this book do focus more comprehensively on these issues. After all, a brief overview of the presentation of financial statement in European countries is given, as this chapter not only aims to shed light on the concepts of general purpose financial statements but also the practical application in a European context.

## Statement of Financial Position

The statement of financial position may also be referred to as a balance sheet. Table 1 provides a sample statement of financial position. It aims to present an entity's assets and liabilities at the end of a given reporting period, traditionally the 31st of December.

**Financial Statements, Table 1** Sample statement of financial position

| Public Sector Entity – Statement of financial position as at December 31, 20X2 (in thousands of currency units) | | |

| **Net assets/equity** | ***X*** | ***X*** |

Source: Adapted from IPSAS no. 1, Presentation of Financial Statements, p. 210 (IFAC 2015b)

The IPSAS CF 5.14 (IFAC 2015a) defines an asset as *"a resource presently controlled by an entity as a result of a past event."* As such, assets are items with service potential or the ability to generate future economic benefits. In comparison to the private sector, assets may not only be held in order to generate future economic benefits but also with respect to their capacity to provide services that contribute to achieving the entity's objectives. Public sector assets that carry service

F

potential may include recreational, heritage, community, defense, and other assets which are used to provide services to third parties. However, resources may only be considered as an asset, if an entity has control over the resource, i.e., the ability to use the resource and to derive the service potential or economic benefit embodied in that resource, and if the resource has arisen from a past event, as for example through an exchange or nonexchange transaction. If a resource does not comply with these characteristics, an entity must not recognize an asset in the balance sheet.

According to the IPSAS CF 5.14 (IFAC 2015a), a liability *"is a present obligation of the entity for an outflow of resources that results from a past event."* A present obligation indicates that an entity has little or no realistic alternative to avoid an outflow of resources. Furthermore, to satisfy the definition of a liability, a present obligation must have arisen as a result of a past transaction or other event. If these characteristics are not met, an entity must not recognize a liability. For example, an entity may well recognize a provision for a past earthquake, if resource outflows are probable. However, an entity is not allowed to recognize a liability for a future earthquake. In the absence of a past event, this situation does not satisfy the definition of a liability.

As discussed above, the statement of financial position does present an entity's assets and liabilities. The residual value when comparing assets against liabilities is the net equity/assets. If assets exceed liabilities, net assets/equity is positive. However many public sector entities, also in the European context, may face a situation where liabilities exceed assets and therefore present negative net assets/equity (Rauskala and Fuchs 2012). Compared to the private sector, where negative equity levels might cause serious problems for an enterprise, public sector entities usually continue to exist, even under negative net assets/equity. Hence, in the public sector, negative net assets/equity may prevail over a longer period of time than in the private sector. However, even for public sector entities, it should be clear that negative net assets/equity levels indicate situations that are not economically feasible over a long period of time (Bergmann 2008).

IPSAS requires a distinction between current and noncurrent assets and liabilities. The term current refers to the fact, that both assets and liabilities are due to be settled within the next 12 months (IFAC 2015b, 1.76 and 1.80). These current assets include assets such as cash or cash equivalents, receivables, inventories, and accrued revenues. Current liabilities may include government transfers and some accrued expenses for employees and other operating costs. The noncurrent assets and liabilities however are to be seen in the context of longer-term resources such as property, plant and equipment, or obligations including borrowings or pension liabilities. The illustrated classification organizes financial information due to their urgency and priority in financial management. It therefore shall support the users of balance sheet information to better navigate and analyze financial data.

Compared to the corporate sector where balance sheet information is well developed and is considered to be an important source of information for decision-making, this is not generally the case for public sector entities where the implementation of accrual accounting has taken place only recently. However, recent developments such as the financial crisis, the growing worry of heavily indebted countries with more than 11 sovereign defaults in the past 10 years (The Economist 2014), the establishment and enforcement of the Maastricht criteria, and current discussions about adequate bailout strategies in Greece, combined with the international spread of accrual accounting reforms – also in many developing countries – have been triggering increased interest in balance sheet information.

## Statement of Financial Performance

From a user's perspective, the statement of financial performance is perhaps the most prominent and important source of information. Other names for the statement of financial performance are profit and loss (P&L) statement or statement of revenues and expenses. Table 2 presents a sample statement of performance, classified by function.

**Financial Statements, Table 2** Sample statement of financial performance (by function)

Source: Adapted from IPSAS 1, Presentation of Financial Statements, p. 211 (IFAC 2015b)

The statement of financial performance reports revenues by nature and expenses either by function, nature, or organizational unit and – bottom line – the surplus or the deficit. The way how expenses are presented in the statement of financial performance depends on historical and regulatory factors and the nature of the entity. IPSAS requires the management to select the most relevant and reliable form of presentation, depending on the different types of entities (IFAC 2015b, 1.116).

As the statement of financial performance presents revenues and expenses, it makes sense to briefly discuss these two types of transactions. Revenues are defined as *"increases in the net financial position of the entity, other than increases from ownership contributions."* (IFAC 2015a, 5.29). Hence, any type of exchange (e.g., service fees) or nonexchange transactions (e.g., tax revenues) leading to an inflow of resources have to be considered as revenues. In contrast, expenses are characterized as "*decreases in the net financial position of the entity, other than decreases arising from ownership distributions"* (IFAC 2015a, 5.30). Expenses thus lead to a decrease in economic benefits or service potential in the form of outflows or consumption of assets or incurrences of liabilities that result in a decrease of the net assets/equity position.

It is important, however, to distinguish such inflows or outflows from owners, including those inflows that initially establish the ownership interest, and outflow of resources to owners in their capacity as owners from revenue and expense. Although ownership contributions might be less common in the public sector than in private markets, many public sector entities hold a substantial portfolio of public sector corporations or had to recapitalize private sector corporations during the financial crises.

## Statement of Cash Flows

The requirements of a cash flow statement and its structure are governed by IPSAS 2. It is obviously closest to the former cash basis of accounting and serves as a bridge between cash and accrual accounting (Bergmann 2008). The main purpose of the cash flow statement is to present the way cash and cash equivalents are generated and used. Hence, it identifies (a) the sources of cash inflows, (b) the items on which cash was expended during the reporting period, and (c) the cash balance as at the reporting date (IPSAS 2). This type of information cannot be comprehensively extracted from the balance sheet, as it only shows the cash level at the beginning and the end of the reporting period and thus giving no information regarding the reasons why cash levels have changed between two reporting dates. Also, the statement of performance is not fully satisfying the cash view, because it includes both, cash and noncash transactions. Hence, the IPSASs require all entities to present a cash flow statement in order to give users

an understanding of the timing and certainty of cash flows when making and evaluating decisions about the allocation of resources.

A sample statement of cash flow is given in Table 3. It comprises three different sections, namely, (1) the cash flows from operating activities, (2) the cash flows from investing activities, and (3) the cash flows from financing activities. The cash flow from operating activities may be determined by either the direct or indirect method, although the direct method is given priority in practice (although the indirect method is easier to adopt). Although all three individual sections provide important information on their own, it might be particularly useful for users to compare section (1), the cash flows from operating activities, with section (2), the cash flows from investing activities. A vast negative ratio gives rise to evidence that investment projects had to be primarily funded by external debt, which could negatively affect public sector debt levels in the future.

**Financial Statements, Table 3** Sample cash flow statement

| Public Sector Entity – Cash flow statement as at December 31, 20X2 (in thousands of currency units) | | |
|---|---|---|
| | 20X2 | 20X1 |

## Changes of Net Assets/Equity

Table 4 presents a sample statement of changes in net assets/equity. Changes of net assets/equity can occur basically because of different reasons. Obviously, one reason is the fact that the entity reports a surplus or a deficit. Under accrual accounting, this result is shown both in the statement of financial performance and the balance sheet. Such surpluses or deficits are then allocated to the net asset/equity or paid out as dividends, for example in the case of public sector corporations (Bergmann 2008). However, there are other transactions which can affect net assets/equity. There are valid reasons for such a booking, as for example contributions from owners such as share capital. Other (valid) reasons might include actuarial gains or losses of pension plans according to IPSAS 25 or the revaluation surpluses/losses of property, plant, and equipment according to IPSAS 17. Normally, however, all items of revenue and expense recognized in a period are included in surplus of deficit (IFAC 2015b, 1.100). Nevertheless, public sector entities might be tempted to recognize losses or gains directly in the statement of net assets/equity, thus avoiding their presentation in the statement of financial performance. In most cases, such bookings do not reflect a faithful presentation and is against accounting standards (Bergmann 2008).

## Notes

In order to analyze and interpret the numbers presented in the previously discussed face of the

financial statements, it is necessary from a user perspective to have additional information in the so-called notes. Hence, IPSAS stipulates extensive minimum disclosure requirements in the notes, supplementing the disclosures required by individual IPSAS. According to IPSAS 1.127 (IFAC 2015b) the notes shall:

(a) Present information about the basis of preparation of the financial statements and the specific accounting policies used
(b) Disclose information required by IPSAS that is not presented elsewhere in the financial statements
(c) Disclose additional information that is not presented on the face of the financial statements but that is necessary for a faithful presentation

## Presentation of Financial Statements in Selected European Countries

This chapter not only aims to give background about the theoretical concepts of the financial statements but also about the practical application in European countries. Table 5 gives an overview about the presentation of financial statements in selected European countries at national level. Obviously, the presentation of financial statements stands in close relationship with the distinct reporting practices in different countries. Hence, countries which have adapted accrual accounting principles (10 out of 14) tend to present more comprehensive financial statements than countries which still follow modified accrual accounting principles (Germany, Greece, Italy, the Netherlands). It is not surprising, though that those countries which have already adopted IPSAS (Austria, Spain, Switzerland) present the most comprehensive set of financial statements.

Overall, it can be argued that the most common reported financial statements are the balance sheet, the statement of financial performance, and the notes to the financial statements. The cash flow statement and the statement of changes in net assets/equity are less commonly disclosed. Quite frequently, central governments also publish consolidated financial statements covering not only central government but also public sector corporations and/or local governments (e.g., Bergmann et al. 2015; Brusca et al. 2015; Grossi and Newberry 2009). It is therefore not surprising that there is a significant level of heterogeneity among the different European countries regarding their accounting systems and the presentation of financial statements. This heterogeneity would even be larger, if sub-national levels were to be analyzed as well. However, the continued move towards full accrual accounting practices and the increasing adaption of IPSAS on all governmental levels (not only in Europe) are likely to reduce the existing high level of heterogeneity in public sector financial reporting, thereby contributing to an

increased inter(-national) comparability of financial statements.

## Conclusions

The main objective of this chapter was to draw attention to the general purpose financial statements, as described and governed in the IPSASs. The rationale behind general purpose financial statements is to provide general users with relevant information for accountability and decision-making purposes. Hence, the purposes of financial statements are therefore determined by the information needs of its users. In order to achieve this objective, general purpose financial statements prepared and presented under IPSAS have to observe distinctive qualitative characteristics and to present a complete set of financial statements, thereby integrating retrospective and prospective as well as financial and nonfinancial information. However, current reporting practices in different European countries show a vast heterogeneity with respect to the presentation of financial statements, both between countries and governmental levels. This heterogeneity still limits reporting transparency and imposes serious challenges for any users, from an accountability and decision-making perspective. Only a continuous development towards full accrual accounting practices combined with an increased adaption of IPSAS is likely to facilitate (inter-)national comparability in order to achieve the "general purpose" of financial statements, which is to be a relevant, useful, and faithful piece of information.

## The Definition of Financial Sustainability

Financial sustainability is understood as the ability of public administrations to continue now and in the future current policies without causing the debt to rise continuously.

## Introduction: The Sustainability Problem

"Sustainability" is a complex term (Aras and Crowther 2009) that comprises three main dimensions: environmental, social, and economic categories (GRI 2013). Nonetheless, the international situation of financial crisis has led to financial sustainability to become a key concept in public administration (Afonso and Jalles 2015), even more important than the other dimensions for public sector management (Afonso and Jalles 2015; Rodríguez Bolívar et al. 2014).

Indeed, the economic crisis has undermined the capacity of governments to continue provided public services, creating significant imbalances in economic growth in different regions (Méndez et al. 2015). It has spurred a demand for greater financial sustainability in public administrations, and these administrations have been pressured to provide higher quality financial information and maintain information transparency, so as to detect financial distress (Zafra-Gómez et al. 2009) and achieve sustainable financial balance (Burritt and Schaltegger 2010).

Although this pressure for financial sustainability has become relevant at any level of public administration, it is especially relevant at local governments because they are closest to the general public and support the greatest burden as far as public services are concerned.

In addition, the high volume of budgets managed at this level, the great variety of services provided (Sáiz 2011), and the present context of accumulated deficit and debt in large municipalities (Muñoz-Cañavate and Hípola 2011) render it necessary to analyze the capacity of local governments to continue providing services in the future. In fact, there exists a considerable consensus of opinion that the development of sustainability will not be met without the full involvement of local governments and of civil society (cf. Echebarria et al. 2009).

This situation has led leading international organizations to have pointed out the need for sustainability policies to be implemented (IFAC 2012; EU 2012a) in order to create the necessary conditions for achieving financial health and ensuring intergenerational equity (Cabaleiro et al. 2013).

Thus, the European Union (EU), for example, has issued recommendations linked to governmental solvency in terms of inter-temporal budget constraints (EU 2012a) and has called Member States to implement solid accounting systems in drawing up budget forecasts with the aim at producing high-quality, comparable statistics (EC 2011). Concretely, the Directive 2011/85/EU of the European Council of 8th November 2011 (EC 2011) stresses that improvements in public accounting practices, making them more comprehensive and reliable, are crucial to financial sustainability.

Other institutions, like the OECD (2015), have issued a detailed overview of institutional frameworks for financing public services due to the great relevance of these services. In particular, the OECD (2015) has issued some guidelines for Fiscal Sustainability of Health Systems, as public funds account for around three-quarters of total spending on health across the OECD. However, controlling public health expenditure growth is particularly difficult for budget officials.

In brief, global financial and economic crisis has led public administration to be aware of the need of financial sustainability policies to assure the future of the delivery of public services, some of them are perceived by citizens as a very high priority services. It has made to issue some guidelines regarding financial sustainability of public administrations. But, what does financial sustainability mean? How can it be measured? What incentives or risks factors could affect the achievement of financial sustainability in governments? These questions are dealt with in the following sections of this article.

## History and Implication of the Concept of Financial Sustainability

Although at its simplest, sustainability means making thing lasting, making them permanent and perdurable, what is being sustained can be an object of choice – an economy, a culture, an ethnic group, etc. (Pearce 1988). Focusing on the

public management field of knowledge, although several attempts have been made at formulating a definition of financial sustainability, this term is a fuzzy concept that is not used consistently within the literature or international bodies.

A first approach to the concept of financial sustainability could be associated to Hicks (1945). According to this economist (Hicks 1945), economic sustainability was included within the concept of income, this former being defined as the maximum amount that a person can consume during a period and still be as well-off at the end of the period as he was at the beginning.

Stavins et al. (2003) suggest that a broadly defined approach should be taken to sustainability, based on a growth that combines dynamic efficiency – measured on the basis of the difference between revenues and expenses – with future maintenance. Nonetheless, authors such as Pezzey and Toman (2002) have warned that it is also indispensable to have an understanding of the rights of future generations in this concept.

This way, one of the crucial issues pertaining to sustainability is that of intergenerational equity (World Commission on Environment and Development 1987), and it has been allied with the term "inter-period equity" (Stavins et al. 2003; IFAC 2015; Pezzey and Toman 2002). Based on this concept, the CICA (1997) and Stavins et al. (2003) indicate that sustainability can be defined as the ability of government to deliver services at present without compromising the ability to do so in the future.

In the field of public sector accounting, this concept is closely linked to the economic performance of local government, defined as the ability of the income it generates in any 1 year to cover the costs of delivering its services (GASB 1990). Therefore, in the last years, the financial sustainability concept has moved into the financial accounting system of public administrations.

This way, a first way of writing down the widest definition of sustainability is to look at the solvency condition for the general government through the government's inter-temporal budget constraint (European Union 2012a). This considers the ability of the government to meet the costs of its current and future debt through future revenues (European Union 2012a). It means that governments should generate financial independence – defined as the organization's ability to generate sufficient nonfinancial income to meet its nonfinancial budgetary obligations (Groves and Valente 2003) – in order to obtain future revenues to meet current and future debt.

Finally, recent international pronouncements (US Agency for International Development (USAID) 2011; European Union 2012a; European Commission (EC) 2011) have understood this concept as the ability of public administrations to continue now and in the future current policies without causing the debt to rise continuously.

In conclusion, the concept of financial sustainability has been linked to the concept of intergenerational equity or "inter-period equity," which means the need of rendering public services without compromising the ability to do so in the future (in direct form or in indirect form through the rise of the debt of the governmental entity). This meaning of financial sustainability has been moved into the public sector accounting system in different concepts such as solvency, fiscal distress, or, in the last years, financial sustainability measured by the adjustment of the income statement. In the next section, a method to measure financial sustainability is proposed.

## The Measurement of Financial Sustainability

According to IFAC (2013), long-term sustainability of a public sector entity's finances is composed of three interrelated dimensions: service, revenue, and debt. Nonetheless, although international organizations and prior research agree that the financial sustainability is comprised by these dimensions (Rodríguez Bolívar et al. 2014; IFAC 2013), there is no consensus about its measurement.

International organizations (EU 2012a, b; IFAC 2012) and previous studies (Rodríguez Bolívar et al. 2014) have recognized the usefulness of government financial statements for reporting on the public financial sustainability.

The IFAC (2013) and the European Council (2011) have also highlighted the importance of financial statements for assessing financial sustainability, considering them vital to achieving an understanding of the present situation of public finances. Specifically, the income statement is strongly linked to the intergenerational equity concept (GASB 1990; IFAC 2012, 2015), which has a crucial importance in assessing financial sustainability (Pezzey and Toman 2002; Stavins et al. 2003; IFAC 2015), by enabling users to assess, on the one hand, the capacity of the entity to continue providing at least the same volume of goods and services and, on the other hand, the level of resources that will be needed in the future to continue to fulfill its public services' delivery obligation (GASB 1990; IFAC 2015).

Indeed, IFAC (2012) indicates that the income statement provides useful information for assessing future ability of governments to continue providing the same services while maintaining their quality, which is a main feature of long-term fiscal sustainability. Accordingly, the IFAC has released a Recommended Practice Guide that provides a guidance report on the financial sustainability of governmental entities, identifying that it consists of three interrelated dimensions: revenues, debt, and services.

According to IFAC (2013), the income statement would reflect an approach to two of the three dimensions included into the fiscal sustainability, in particular, the revenue dimension, whose value is included in this financial statement, and the service dimension, whose economic measurement, as stated in paragraph 32 of the pronouncement (IFAC 2013), can be estimated by the entity's service delivery commitments, which is also integrated via expenses on the income statement. Moreover, to the extent that the level of debt is associated with the volume of services provided, the income statement also reflects a very influential factor in the third dimension, as is debt (IFAC 2013, paragraph 38).

The appropriated use of the income statement as an approach of the three dimensions mentioned by the IFAC has been tested by Navarro-Galera et al. (2016) who have concluded that governments provide empirical evidence to support the idea that the income statement reveals important information about the effect of the evolution of the three dimensions on the financial sustainability of governments, including the individual effects in each dimension and the impact of the interrelation between them.

Nonetheless, it is arguable whether the income statement offers a sufficiently representative measurement of inter-period equity with which to assess the financial sustainability of local governments (Rodríguez Bolívar et al. 2014), because it includes extraordinary activities which are not expected to be repeated in the foreseeable future within the environment in which the organization operates. Accordingly, the effect of revenues and expenses deriving from extraordinary activities must be corrected in the income statement, since they lack of any future scope. This modification would make the income statement a more reasonable measure of the intergenerational equity and more accordant with the concept of financial sustainability.

Likewise, there is a difference between the concepts of budget expenditures and revenues (they contribute to the annual budget) and financial expenditures and revenues (they fall within the area of financial accounting). The budget expenditures and revenues are part of the budget and provide the annual budget results, while the financial expenditures and revenues fall within the area of financial accounting and constitute the income statement as analyzed above. The differences between these concepts arise, on the one hand, from their content and, on the other, from the criteria applied for their allocation. In this regard, while expenses and income are allocated to the income statement in accordance with the accrual basis of financial accounting, the allocation of budget expenditure and revenue is primarily cash based or follows a mixed cash-accrual criterion in determining the budget results.

In summary, in measuring financial sustainability, the adjusted income statement (adjusted for extraordinary results) could be a good indicator because it is an accounting statement based on the accrual basis (IFAC 2015), which is closely linked to the intergeneration equity concept. The following table shows the proposal of Rodríguez

et al. (2014) in measuring financial sustainability in public administrations:

| Concept | Amount |
|---|---|
| Income statement for the financial year obtained by applying the current IPSAS | (1) |
| + Negative entries for extraordinary activities | (2) |
| − Positive entries for extraordinary activities | (3) |
| Corrected income statement for the financial year (intergenerational equity for financial sustainability) | (1) + (2) − (3) |

## The Incentives for Financial Sustainability

The identification of explaining drivers and risk variables for financial sustainability can help public managers and politicians to make decisions that seek to strengthen the factors that favor financial sustainability (drivers) and to reduce the negative effects of risk factors through the adoption of measures such as reducing costs, increasing revenues, or consuming reserves, which can contribute to sustainable development of the regions (EU 2012a, b; IFAC 2013).

International organizations (US Agency for International Development 2011; EU 2012a; EC 2011) and prior research (Guillamón et al. 2011; Rodríguez Bolívar et al. 2014; Navarro-Galera et al. 2016) have performed many analyses of the relevance of budget information and other variables with respect to governmental financial sustainability.

The European Commission (EU 2012a), for example, has highlighted the following factors as vital to any assessment of the overall sustainability of a country's public finances: pension expenditure projections, the level of debt, the primary balance, and the assets of public administrations in cases where the real and book values differ or where returns differ from the interest rate on the debt.

On the whole, demographic and financial-economic variables have been considered to affect the evolution of public debt and fiscal distress in governmental entities. In this regard, as demographic variables, the main explanatory factors identified by prior research are population size, population density, dependency ratio, level of unemployment, immigration, and, finally, the education level.

The population size has a negative effect on public spending (Choi et al. 2008), on saving, on fiscal capacity (Carr and Karuppusamy 2010), and on public debt (Guillamón et al. 2011). Nonetheless, it is not clear its influence on financial sustainability (Rodríguez Bolívar et al. 2016).

Regarding the population density, the results obtained have been contradictory. While some have observed a negative influence of this factor on public spending (Choi et al. 2008) and on public debt (Bahl and Duncombe 1993), others have failed to obtain significant results in this regard (Guillamón et al. 2011). Also, this variable has not been found relevant in analyzing financial sustainability of public administrations (Rodríguez Bolívar et al. 2016).

The studies about the dependency ratio, defined as the ratio of the dependent population (those aged under 16 and over 65 years), have concluded that this ratio does affect the financial capacity of local authorities (Carr and Karuppusamy 2010) and the per capita spending and taxation and therefore the budget balance (Choi et al. 2008). Indeed, population aged under 16 years old have been identified as a risk factor that could endanger financial sustainability of governments (Rodríguez Bolívar et al. 2016).

The level of unemployment is another very significant aspect in studies of public finances, especially in a context of international crisis, because it not only provokes increased social spending and changes in employment patterns (Zafra-Gómez et al. 2009) but also decreases the revenues available to the public treasury. Thus, the increase of the rate of unemployment has been identified as a risk factor for financial sustainability (Rodríguez Bolívar et al. 2016).

In addition, the theoretical analyses performed by Schultz and Sjöström (2004) show that migration flows tend to raise the level of accumulated debt, a significant finding corroborated in the empirical study by Guillamón et al. (2011). For

this reason, another variable incorporated into studies of public finance is that of the immigrant population. In this respect, while some authors have reported the immigrant population to be positively associated with the tax burden (Benito et al. 2010), by requiring increased social spending, others have reported this factor to have a negative influence on the financial performance of public administrations (Zafra-Gómez et al. 2009).

Finally, the education level of the population affects the demand for government information (Caba et al. 2008).

On the other hand, budgetary variables have also been considered important factors with respect to public finance. The Stability and Growth Pact of the EU Member States (EU 2012a), the Fiscal Sustainability Report (EU 2012b), and Directive 2011/85/EU of the European Council of 8 November 2011 (EC 2011) all consider that budgetary variables such as the budget surplus/deficit may determine long-term sustainability. In fact, budget outcome has been demonstrated to be a key factor for financial sustainability of governments (Rodríguez Bolívar et al. 2014).

The IFAC (2013) also considers that the revenue dimension includes the ability to vary government revenues from taxes and create new ones, including income received from entities at other levels of government or from international organizations. The analysis of the revenue dimension with the differentiation between the origin of the revenues (external vs. internal revenues) and the destination of them (capital revenues and operating revenues) could be relevant for promoting financial sustainability in governments. Indeed, prior research shows that the source of revenues and its destiny could influence their probability of future occurrence (Guillamón et al. 2011) and, hence, on the financial sustainability of governments (Rodríguez Bolívar et al. 2014).

Regarding the debt dimension, the IFAC (2013) states that it must be measured by debt net per capita, since it is a variable that provides information about public administration's indebtedness in a year, taking into account current policies in the provision of goods and services. Therefore, an increase in this indicator shows that a higher proportion of income is required to repay the debt, causing the diversion of resources necessary for the provision of services. Thus, the debt control is crucial to maintain financial sustainability (Checherita-Westphal et al. 2014).

Furthermore, to analyze the debt dimension (net debt per capita), authors such as Cabaleiro et al. (2013) suggested that the maturity and origin of the debt could influence on financial sustainability. Nonetheless, Navarro-Galera et al. (2016) have not found empirical evidence of this assertion.

Finally, IFAC (2013) considers the services dimension as the quality and volume of services provided by the government-given current policies. This dimension must express the ability of the entity to maintain or change the volume and quality of provided services. Following Schaltegger and Torgler (2006), the expenditures are an approach of the government size. In fact, Choi et al. (2008) take government expenditures as approach of demand for public services and goods, due to the causal relationship between volume of provided services and expenditures. It means, a greater volume of provided services by local government requires a greater amount of expenditures (staff, infrastructures, etc.), since the resources employed by local government to meet the citizens' demands increase when the number of users of public services rises. This assertion has been demonstrated empirically by Navarro-Galera et al. (2016).

In brief, demographic and financial-economic variables could affect financial sustainability of governments. Policy makers and public manager should be aware of the need of implementing public policies for achieving financial sustainability according to different frameworks characterized by these variables.

## Conclusions

In recent years, financial sustainability in governments has become relevant in public

administrations due to the financial and economic crisis of economies. Citizens and other stakeholders are requiring public administrations to provide high-quality information regarding the use of financial resources and the need of balanced public revenues and expenses with the aim at maintaining public services in the future. Nonetheless, although the financial sustainability concept has raised a lively debate nowadays, it is not clear the concept of financial sustainability or the method to be used in the measurement of this issue.

This article has shown some definitions pronounced by international organizations, as well as methods to measure financial sustainability of governments based on the dimensions that these organizations have indicated. According to prior research (Rodríguez Bolívar et al. 2014), the adjusted income statement of public administration could be a good indicator of the financial sustainability of governments.

In addition, policy makers, public managers, voters, and other stakeholders are not only interested in measuring financial sustainability in governments but also in identifying drivers and risks factors that could make a government to be unsustainable.

The knowledge about these factors could help policy makers and public managers to take decisions with the aim at maintaining the quality and volume of public services over time and to accomplish the intergenerational equity concept. In this regard, some main demographic and financial-economic variables have been identified to be relevant in monitoring and predicting financial sustainability in governments.

# Financial Vulnerability and Nonprofit Organizations

Santiago Guerrero
Rockefeller College of Public Affairs and Policy, University at Albany, Albany, NY, USA

## Synonyms

Double bottom line; Financial distress; Financial shock; Nonprofit risk; Service cutback

## Introduction

The nonprofit sector is comprised of organizations established for the purpose of serving a public or mutual benefit that is different from the accumulation of profits. Referring to these organizations as "nonprofit organizations" doesn't precisely define those organizations because they are not actually barred from earning profits. Instead, nonprofit organization are largely characterized by being barred from distributing profits among the people that control them.

Although the focus of nonprofit organizations is to achieve a mission rather than to earn profits, this does not mean that nonprofit organizations should not earn profits or that their finances are less important. The popular saying "no margin, no mission" credited to Sister Irene Kraus from the Daughters of Charity National Health System clearly expresses the necessity of nonprofit organizations to care about their finances in order to achieve their missions. This defining characteristic of the nonprofit sector is what commonly is referred to as the "double bottom line" of nonprofit organizations. Nonprofit organizations have to care about two different but complimentary bottom lines, which are the mission bottom line and the financial bottom line. Even though both bottom lines are of great importance, nonprofit managers may be more attuned to managing their mission than managing finances and often underestimate the importance of financial management for achieving their mission. Nonprofit

organizations are charged with the challenging task of balancing their need to maintain an adequate financial condition while pursuing the organizational mission and maintaining consistent and quality programs over time.

Studying and understanding the finances of nonprofit organizations becomes a key issue because an organization's mission depends on its finances. Nonprofit managers need to be aware that financial problems can prevent their organization from achieving its mission and nonprofit financial vulnerability theories offer options for managers to stop this from happening.

## Nonprofit Financial Vulnerability

A nonprofit organization can be considered financially vulnerable if the organization's options for responding to financial shock are limited to cutting back on central services or programs. Notice that a nonprofit organization is only considered financially vulnerable if its programs and service offerings are at risk. This speaks to the double bottom line idea introduced earlier in this entry.

Delineating which features of the finances of a nonprofit organization make it a financially vulnerable organization has been one of the major obstacles for advancing our understanding of nonprofit financial vulnerability. For example, some researchers focus on cutbacks in programs or services and consider a for-profit organization to be financially vulnerable when it experiences reductions in program expenses for three consecutive years (Greenlee and Trussel 2000). Note that this approach falls short of explaining why three consecutive years constitute the threshold for determining which organizations are financially vulnerable. Another limitation of this approach is that it doesn't distinguish between different levels of program expense reductions. For example, a 5% reduction in program expenses is expected to have a very different effect on operations than a 25% reduction in program expenses, and this approach fails to recognize these differences.

Another approach to financial vulnerability is to focus on net asset reductions rather than program expense reductions as the key characteristic of a financially vulnerable organization. Accordingly, this approach defines a financially vulnerable organization as one that has experienced at least a 20% reduction in its net assets for three consecutive years (Trussel 2002). However, this alternative approach to financial vulnerability fails to establish how net asset reductions are related to service cutbacks, which is an integral part of the double bottom line idea of nonprofit organizations.

This net asset reduction approach has at least three limitations. First, an organization may experience reductions in its net assets for three consecutive years and still maintain a stable level of services. Second, there is no evidence that a 20% reduction in net assets is a reliable threshold to distinguish financially vulnerable nonprofit organizations from organizations that are financially stable. This threshold should be set empirically by determining what level of net asset reduction is likely to lead to program and service cutbacks. Third, this approach fails to identify organizations that experience small reductions in their net assets for several years. Nonprofit organizations may experience several consecutive years of small deficits, which can erode net assets and make an organization financially vulnerable.

A different approach to determining financial vulnerability is by identifying organizations that "fail the ultimate test of simple persistence" (Hager 2001, p. 382). This understanding of financial vulnerability is derived from corporate finance literature that places special attention to financial ratios which predict bankruptcy. Exploring the predictors of bankruptcy in the nonprofit sector is less relevant because few nonprofits actually declare bankruptcy. It is common for nonprofit organizations struggling financially to cease operations and disappear without declaring bankruptcy or to merge with other organizations as an attempt to survive. Conducting studies that include only nonprofit organizations that filed for bankruptcy can be misleading because these types of analyses are likely to exclude nonprofit organizations experiencing dire financial risk that simply opt to disappear or merge rather than going through bankruptcy procedures (Keating et al.

2005). Rather than studying organizations that filed for bankruptcy, nonprofit financial vulnerability studies have focused on organizations that are defunct – those that fail to report to the IRS for four consecutive years – and characterize these organizations as financially vulnerable. The problem with this approach is that it is excessively restrictive as it excludes from consideration those organizations that may be at financial risk and experience service cutbacks but still manage to survive and deliver services at reduced levels.

More recent approaches to nonprofit financial vulnerability choose not to operationalize the concept in terms of one variable and instead rely on four different measures of adverse financial health that specifically relate to the organization's ability to achieve its mission (Keating et al. 2005, p. 11). The measures of adverse financial health include insolvency (negative net assets), financial disruption (at least 25% decline in net assets), funding disruption (at least 25% decline in total revenue), and program disruption (at least 25% decline in program expenses). The inclusion of four separate dimensions can be problematic because it does not take into consideration the interrelations between the different dimensions. For instance, an organization may experience financial or funding disruptions and still maintain its level of services and carry out its mission. In addition, this approach, like the others, sets arbitrary thresholds for distinguishing between organizations financially vulnerable and financially sound organizations. The table below summarizes the different ways that financially vulnerable nonprofit organizations have been identified in the nonprofit finance research (Table 1).

**Financial Vulnerability and Nonprofit Organizations, Table 1** Definitions of financial vulnerability

| Definition | Reference |
|---|---|
| Decline in program expenses for three consecutive years | (Greenlee and Trussel 2000) |
| 20% reduction in net assets for 3 years | (Trussel 2002) |
| Closure of organization (four consecutive years of not reporting to IRS) | (Hager 2001) |
| Negative net assets | (Keating et al. 2005) |
| 25% decline in net assets | |
| 25% decline in total revenue | |
| 25% decline in program expense | |

## Determining Factors of Nonprofit Financial Vulnerability

Despite differences in the definition of nonprofit financial vulnerability, there is some consensus regarding what makes a nonprofit organization financially vulnerable. The determining factors of financial vulnerability are derived from assumptions about the options that available to managers for replacing lost revenues in order to avoid cutting back programs or services.

Figure 1 summarizes the overall idea behind the nonprofit financial vulnerability theory. When an organization experiences a *financial shock* – a reduction in revenues – those who manage the organization face the challenge of identifying ways to replace the lost resources so that they can *maintain desired level of service or program delivery*. The center of Fig. 1 displays the strategies available to managers to replace lost resources and avoid cutting programs or services delivery, which include (1) using current profits after the revenue reduction, (2) diversifying revenues, (3) using accumulated net assets, (4) increasing operational efficiency, or (5) borrowing (Tuckman and Chang 1991; Trussel 2002). Financial ratios are computations made with information taken from a nonprofit organization's financial statements that can be used to determine whether the organization's finances provide enough flexibility to replace lost revenues. That is, financial ratios are meant to assess whether these strategies are available to managers. The next sections of this entry explore the different strategies available to managers to replace lost revenues and the financial ratios that can be used to assess the viability of each strategy.

## Use Current Profits

Current expenses incurred by an organization are often funded by the revenues earned during the current year. This is evidenced by the budgeting process when organizations create their yearly

**Financial Vulnerability and Nonprofit Organizations, Fig. 1** Financial vulnerability theory

budgets by considering the revenues and expenses for the corresponding year. To the extent that an organization does not have flexibility to replace the resources lost due to a reduction in revenues, reductions in current revenues are expected to lead to reductions expenses which are likely to result in service and program delivery cutbacks.

However, not all reductions in revenue necessarily affect the level of services. Organizations that generally have large annual profits are in better shape when facing a financial shock as they can draw from their current revenues before having to reduce expenses, avoid having deficits, and still be in a position to maintain stable levels of program or service delivery. Organizations with high operating margins can experience revenue reductions and still have enough current financial resources to cover the same level of expenses necessary to avoid service or program cutbacks. On the other hand, organizations with deficits do not earn enough revenues to cover their expenses, which is more likely to result in program or service cutbacks.

A financial ratio used to assess whether this is a practical strategy for an organization is the operating margin. This ratio is generally determined by subtracting expenses from revenues and dividing the result by the revenues. This formula is expressed as ([revenues – expenses]/revenues). Organizations with higher operating margins are in better position to avoid service and program cutbacks after a financial shock.

## Use Unrestricted Net Assets

Another way for a nonprofit organization manager to overcome a financial shock is to pull from the organization's net assets which are historically accumulated surpluses from the operations. Organizations with larger net asset balances can pull from their previous years' net assets to replace the revenue reduction and maintain a stable level of service delivery. Managers may choose to accumulate net assets to hedge against uncertainty and have them available to use them as a "rainy fund" when the organization is struggling financially. However, net assets may not be readily available to every nonprofit organization because they may have temporary or permanent restrictions set by donors. Unrestricted net assets are the net assets of a nonprofit organization that has no such restriction and therefore are available to the organization to use at its will. However, unrestricted net assets may not always be readily available to an organization because they may be illiquid assets such as invested in property, buildings, and equipment.

Empirical tests of nonprofit financial vulnerability have consistently found that higher net asset balances are associated with lower financial vulnerability (Greenlee and Trussel 2000; Hager 2001; Trussel 2002). However, while nonprofit financial vulnerability research suggests that higher levels of net asset accumulation are associated with lower financial vulnerability, it does not provide any evidence to support the hypothesis that managers choose to retain net assets for this reason. In some subsectors, however, there is evidence to support the hypothesis that nonprofit organizations do accumulate net assets to reduce financial vulnerability (Calabrese 2011).

Years of net assets is a ratio that can be used to assess whether pulling from net assets is a feasible option. Years of net assets are defined as unrestricted net assets at the beginning of the year divided by the result of subtracting the fundraising expenses from the total expenses of the previous year. The ratio is calculated using the following formula (unrestricted net assets/[program expenses-fundraising expenses]). Although nonprofit vulnerability literature has used equity balance ([assets – liabilities]/revenues) to measure the ability of an organization to pull resources from accumulated retained earnings upon the

occurrence of a financial shock, years of net assets are arguable a preferable ratio because it adjusts for unrestricted net assets and produces a number that can be interpreted more intuitively. Years of net assets can be interpreted as the time an organization can continue to operate at current levels without any additional fundraising. Organizations with higher years of net assets have more flexibility to use these resources to avoid service and program cutbacks.

## Increase Operational Efficiency

Nonprofit organizations commonly measure efficiency as the proportion of total expenses that the organization directs to program service. Nonprofit organizations that proportionally spend more on administration are often considered to be less efficient because administrative expenses take away from allocating more resources to programs and services. This simplistic approach to efficiency in the nonprofit sector has been rightfully criticized. Efficiency is a ratio of input to output; but this definition does not incorporate any tangible input and output measures (Tinkelman and Donabedian 2007). Reliance on the efficiency ratio has led to unintended consequences, such as leading to decisions by organizations to cut vital administrative services or intentionally misreport functional expenses in order to appear operationally efficient and attract contributions. The focus on this efficiency measure as a way to evaluate nonprofit organizations can lead to a starvation cycle in which nonprofit organizations invest too little for infrastructure and inhibit their ability to function effectively (Lecy and Searing 2015).

The financial vulnerability theory approaches efficiency from a different perspective, one in which higher administrative costs are not necessarily a red flag. From the perspective of the financial vulnerability theory, higher administrative costs can provide nonprofit organizations some flexibility because in the event of a financial shock an organization can opt to reduce some of its nonprogram-related costs such as support center costs to maintain a desirable level of services (Tuckman and Chang 1991). Another reason why higher administrative expenses can be associated with lower nonprofit financial vulnerability is that that organizations that invest in organizational capacity – spending more on administration – are better equipped to deal with revenue reductions. For instance, higher administrative expenses can be attributed to managers that earn more competitive salaries and possess the skills and knowledge needed to guide an organization through difficult times.

Administrative expense ratio, which is obtained by simply dividing administrative expenses by total expenses, can be used to assess whether cutting administrative costs is a plausible strategy. Organizations with higher administrative expense ratio arguably have more flexibility to cut these expenses to avoid service cutbacks.

## Diversify Revenues

Nonprofit financial vulnerability theory hypothesizes that organizations that diversify their sources of revenue are less likely to be affected by financial crises because declines in sources of revenues can be absorbed by increases in other sources of revenue. Having several sources of revenue enables nonprofit organizations to balance losses in certain revenue centers with gains in others (Tuckman and Chang 1991). From a resource dependence perspective, organizations that do not diversify their sources of revenue are likely to have a high dependence on their main source of funding and experience instability if that source were to falter. For example, nonprofits that rely on private contributions may see their revenues impacted during financial downturns or when there are other causes that compete for the same source of funding.

Empirical research has shown a relationship between revenue diversification and revenue volatility (Carroll and Stater 2009). The reasoning behind the relationship between revenue diversification and revenue volatility is that organizations with more diverse sources of revenue are likely to have more stable revenues. In this respect, decreasing revenue volatility is a goal for nonprofit organizations that want to reduce

their financial vulnerability, and revenue diversification is a means toward that end. Revenue volatility negatively "influences a nonprofit organization's ability to manage the uncertainty of funding sources over time and the direct flow of financial resources into the organization" (Carroll and Stater 2009, p. 951). A measure of revenue diversification in the nonprofit sector has been adapted from the Herfindahl–Hirschman Index (HHI). The index is estimated using the following formula:

$$H = \sum_{i=1}^{N} (\mathrm{r_i}/\mathrm{R})^2$$

where $N$ is the number of revenue sources available, r is the revenue from each of the different sources, and R is the total revenue. The value of the index goes from 0 to 1, and the index assumes a value of 1 when there is no revenue diversification and gets closer to 0 as revenue diversification increases. Organizations with higher HHI are less diversified and likely have more opportunities to diversify their revenue.

## Borrow

Organizations facing financial shocks can experience short-term liquidity problems that compromise their ability to maintain desired levels of operation. An organization may be willing to draw from its net assets but be constrained by the liquidity of its assets. For example, the net assets held by an organization may be comprised mostly by capital assets which are generally illiquid assets. In these cases, the organization may opt to borrow money short-term to avoid service cutbacks and repay once financial resources are made available. From this perspective, an organization's short-term borrowing capacity can be related to financial vulnerability.

The connection between debt and nonprofit vulnerability can be attributed to the fact that organizations with higher debt have their funds committed to paying the debt. Principal and interest payments constitute firm claims on an organization's resources and reduce the flexibility for the organization to use its resources. The cash flows of an organization may already be committed to future repayments of debt. Organizations with a lower debt burden are in a better position to borrow money to meet their short-term needs to maintain the desired level of program or service expenses.

Another strategy for organizations that find themselves with limited current resources to cover expenses is to delay the payments of the resources needed to maintain the desired level of services. This option is only viable for organizations with low debt ratios. Organizations with high debt ratios are at high risk of compromising the financial stability of the organization if they opt to delay payments because they already have other claims on their cash flows. Note that while short-term borrowing or delaying payments is not necessarily the best long-term strategy for an organization, it is an option available to organizations with low debt ratios that are committed to maintaining the same level of expenses.

Delaying payments to providers is a tactic used for cash management purposes and can lead to problems if used in excess. Nonprofit organizations cannot get away with delaying payments to suppliers for very long periods of time before suffering negative consequences. For example, suppliers may become reluctant to continue providing supplies and/or services necessary for operations to nonprofit organizations that frequently delay payments for prolonged periods of time.

A useful ratio for assessing whether borrowing is a plausible strategy is the leverage ratio which is computed dividing total assets by total liabilities. Organizations with lower leverage ratios are more likely to benefit from the strategies described.

## Conclusion

Nonprofit financial vulnerability research offers strategies that managers of nonprofit organizations can follow to avoid cutting back goods or services in case the organization struggles financially. The ability of a manager to implement any

of these strategies depends on the characteristics of the organization's finances. Research suggests that managers of nonprofit organizations with positive operating margins, more diversified revenues, higher accumulation of net assets, more administrative expenses, and less debt are in a better position to implement these strategies and are less vulnerable.

However, this doesn't mean that nonprofit managers should strive to maximize all of these features of the organization's finances. To the contrary, it might be against the organization's best interest to do so as it may end up compromising the mission bottom line. For example, higher operating margins, net asset accumulation, and administrative expenses can also lead to less resources spent on program services which are related to the organization's mission. There is a trade-off between a nonprofit's organizations financial bottom line and mission bottom line, and nonprofit managers are in the difficult position of finding the right balance. Research of nonprofit financial vulnerability has the potential of helping managers determine how to find the desired balance and which strategies are more effective for avoiding service or program cutbacks.

## Synonyms

Adaptability; Happy aging; Pension schemes; Retirement; Well-being

## Definitions

| | |
|---|---|
| Financial well-being | This is the ability to control one's immediate and anticipated finances, the capability to absorb financial surprise, the ability to meet financial goals, and the financial independence to make the choices that permit one (retired public servant) to appreciate life. |
| Retiree | A person who works and retires either mandatorily, voluntarily, or |

statutorily in a government organization and receives pension from taxpayers' money.

## Introduction

Financial well-being of retirees has become an area of interest among financial researchers, financial educators, policy makers, and practitioner's in recent times. This is because financial well-being impacts retirees psychologically, socially, physically, and emotionally. Worldwide, governments identify that between working years and retirement, public servants are considered most active and valuable. As appreciation for their laudable service to the country and contribution to the economy, governments in both developed and developing countries offer retirees retirement income support. In Nigeria, its commonly termed employee benefits in the form of pension and gratuity.

Thus, pension is usually one of the major social security elements of public interventions for the retired public servants. Retirement is expected to be a pleasurable time in the life of a public servant, except that pension is always not available at the time it is needed. In developed economies such as America, Britain, Russia, United Kingdom, Singapore, etc. where pension schemes are efficient, most of the retirees are comfortable with their pension allowances as there are no alterations in their ability to meet financial needs. They are as comfortable as when they were in active service. In these countries, government makes accessible and satisfactory income, and they provide infrastructural supplies to make retirees enjoy. Worthy of note is that in the twenty-first century, fewer than 15% of the world's six billion retirees could access a formal system of retirement income support. The majority (85%) of the retirees go without formal retirement income coverage lives and work in developing societies. This is indeed worrisome as retirees in developing countries are among the worlds' poorest. Millions of them live on less than a dollar per day, and 80% lack regular retirement income. This level of insufficiency is ascribed to their susceptibility as a result of decline in their physical, mental, and financial powers, thus limiting their ability to work and earn income at retirement. The experience is worse in Nigeria where 89% of retirees lack retirement benefits (NBS 2017). This problem has caused hardship and even death of many retirees in Nigeria, thereby making upcoming retirees dread retirement experience. Therefore, the need to focus on Nigeria in this research is paramount.

To correct some of the anomalies, the federal government of Nigeria, over the years, has introduced several programs to improve the financial well-being of retirees. These programs include the National Provident Fund (NPF) of 1961, the Pension Fund of 1979, the Armed Forces Pension Scheme of 1979, the Police and other Government Agencies Pension fund of 1987, the Local Government Pension Scheme of 1987, and the National Social Insurance Trust Fund scheme of 1993. Each of these schemes was poorly funded; hence they were unsustainable which resulted in their eventual failure. Accordingly, the government of Nigeria abolished them and introduced the Contributory Pension Scheme in 2004. The 2004 Contributory Pension Scheme (CPS) originated in Chile and Latin America. Pension is personalized to the contributors, and it is managed by licensed private sector entities. At present, Nigeria is the first African country to introduce a modified version of the Chilean system, which considered the African uniqueness. In the new contributory system, the public servants contribute a minimum of 7.5% of their basic salary, housing, and transport allowances in the case of civilians and 2.5% for the military. Government contributes 7.5% in the case of the public sector and 12.5% in the case of the military. The CPS members are allowed to open individual Retirement Saving Accounts (RSA) where contributions are collected till retirement. The scheme allows members to voluntarily contribute extra proportion of their salaries into the individual capitalized account. Despite the adoption of the CPS, retirees still experience difficulty accessing their benefits, thereby limiting their financial well-being.

These schemes had three regulatory bodies in the Nigeria pension industry. They include the Securities and Exchange Commission (SEC), the

National Insurance Commission (NAICOM), and the Joint Tax Board (JTB). These commissions are saddle with responsibility to formulate, direct, and oversee the overall policy on pension matters in Nigeria. They establish standards, rules, and regulations for the management of the pension funds. Yet the pension fund administration in Nigeria was characterized by failure or delay in payment of pension and gratuity by governments at all levels. This became a serious challenge to many retirees in Nigeria, forcing them into a situation where they cannot meet their needs. More worrisome is that access to retirement benefits is very difficult as the retirees go through rigorous procedures before they are eventually paid. The most unfortunate situation is where the retirees lost their lives in the process of getting their benefits. Besides there are challenges in funding outstanding retirement benefits which could be because of corruption in the civil service. It was estimated that in Nigeria over N600 billion ($4.5 billion) investible assets could be amassed annually through the pension scheme. Others are bureaucratic and administrative obstructions whereby retirees are grossly abused and pension fund benefits are politically motivated. In some cases, the government is unable to pay the retirement benefits as they become due; instead, it uses the funds to execute capital projects as against the purpose for which the funds were meant. These have resulted in inconsistent and delay in payment, or complete nonpayment of retirement benefits. Similarly, these schemes were characterized by random increase in pension, lacking matching funding provisions, incorrect investment choice, and the erroneous assessment of pension obligations. Thus the unfriendly experiences compel the retirees to complain and call for a redress of their situation. It has further been observed that despite the moderation of the schemes, the management of pension schemes in Nigeria over the years has been characterized by multiple and diverse problems such as inadequate funding, poor documentation and filing in the pension offices, accumulated arrears of pensioners, inability to determine the appropriate investment portfolio, lack of accountability, corruption, and embezzlement of funds among others. At present, some states in the country are yet to join the ongoing Contributory Pension Scheme (CPS). This shows lack of confidence public servants have in the scheme which owes to failures of previous similar government policies. It also poses a threat to their financial well-being, a situation that calls for policy attention.

## Financial Well-Being

The main challenge of governments and policy makers in developed and developing economies, including Nigeria, is how to provide retirement incomes that are able to ensure financial well-being of retirees. Without sufficient pensions, poverty rates which are already high among retirees in Nigeria will be much unbearable. In Nigeria, the pension schemes which are intended to address the financial well-being of retirees have not achieved the desired goals. This is due to shifting of government attention to the provision of capital projects in the society. The ability of retirees to manage their properties and obligations influences their income security and well-being. This may be true of public servants who can quickly exhaust their properties if they manage their portfolios poorly or if they don't save adequately for retirement but rely solely on pension which may not be forthcoming. This would adversely affect their financial well-being. The improvement in the financial well-being of retirees is therefore an effective way to increase their living standards and eventually alleviate adverse concerns created by ageing. The concept of financial well-being has become an area of interest among financial researchers in the recent decades, and it is an evolving research area. Prior to the mid-1990s, several researchers tried to explain, predict, and define related constructs such as financial well-being, financial satisfaction, and economic well-being. However, since these positions are used interchangeably, many researchers have considered developing a conceptual model for the determinants of financial well-being. Determining the factors for predicting financial well-being is complicated as it comprises the objective and subjective status of a financial

situation, behavioral assessment of personal finance, and satisfaction with a personal financial situation; hence they cannot be measured through a unidirectional consideration.

Financial well-being has been adjudged to be important, as quality of life may be directly and indirectly impacted by how individuals perceive their financial well-being. In literature, there is a debate on the conceptualization and measures of financial well-being. Researchers such as Chu et al. (2017) conceptualize and measure financial well-being using different objective characteristics as pointers to financial well-being, such as income and investment performance. Gerrans et al. (2014) conceptualize financial well-being as a subjective appraisal of one's financial status. Parallel to that, Shim et al. (2009) mentioned that financial well-being and financial satisfaction have been used interchangeably in researches. Financial well-being is a perception of the financial situation of an individual who is free from financial concerns. He or she has healthy financial experience based on a subjective appraisal. In a recent conceptualization study, financial well-being was defined as "the perception of being able to sustain current and anticipated desired living standards and financial freedom" (Bruggen et al. 2017). This definition points to the two elements of financial well-being: current money management stress and expected future financial security. It aligns with the debate on the subject matter of this study. This definition is adopted because it emphasizes the importance of subjective feelings. How people assess their financial well-being depends mainly on their own preferences irrespective of their objective financial situation; and, as such, people with similar socio-demographic characteristics may assess their financial well-being differently. Similarly, a positive perception of financial well-being can lead to pleasure, passion, hopefulness, excellent health, and well-developed interpersonal relationships. Therefore, people may assess their financial well-being differently based on their experiences. This implies that the perception of financial well-being also depends highly on individual benchmarks for comparison. Overall, subjective indicators outweigh objective ones in evaluating individual financial well-being as the concept deals with human perception.

## Dimension of Financial Well-Being

The Consumer Financial Protection Bureau (CFPB 2015) conceptualizes financial well-being as an individual's control over his/her finances, the capacity to absorb a financial shock, being on track to meet financial goals, the perception of current finances, financial future, and financial freedom to make choices. Questions were developed in this study according to its context, and respondents were required to specify their degree of agreement or disagreement with the items developed. The responses were anchored on a 6-point scale ranging from 1 = *Not at all true of me* to 6 = *Extremely true of me*. A 6-point scale was used to measure the continuous variables to allow respondents to choose their responses and to reduce response bias. By eliminating the middle point, it provided a better measure and made it simple for respondents to give their opinions. The measurement items were subjected to both validity and reliability tests. Content validity was determined by giving the instruments to 11 respondents who were finance experts and practitioners. Data screening and different statistical tests were performed. Data management was basically done to establish the completeness of data. It involved identifying outliers and missing values as well as establishing the distribution of data to assess whether the assumptions of parametric data were tenable. Hence, the assumptions tested for using procedures recommended by Field (2005) include normality of the distribution of the data, linearity of the data, homogeneity of variance, and multicollinearity. The Statistical Package for the Social Sciences (SPSS) version 23.0 was used to perform exploratory factor analysis (EFA) by running principal component analysis as the extraction method using Varimax with Kaiser normalization to explore factor structure of the study constructs. This assisted to summarize items from the constructs with multiple questions into more meaningful and interpretable factors. Also, the Analysis of Moment Structures (AMOS) version 23 was

used for confirmatory factor analysis (CFA) after performing EFA on the data. The CFA was performed with all the 13 retained items from EFA. The result indicated five survive items as components of financial well-being in Africa, especially Nigeria where the study was carried out.

## Conclusion

In life generally, whatever has a beginning also has an end. Retirement is a typical example of this assertion. Indeed, retirement from active service is a necessary but undesired experience of every public servant. This is because it is a level that all public servants would reach whether they are ready or not. Most public servants ignore this fact at the beginning of employment – that they will exit public service in the future – and they rarely plan for it. This entry explores government efforts and challenges over many decades to satisfy retirees' financial well-being and suggests ways that the government can improve retirement policies aimed at improving the living standard of retirees. To correct the problems associated with the old pension scheme in Nigeria, the government established a new scheme. This entry looks at some aspects of the evolution of the new scheme and discovers that the scheme is inadequate in terms of coverage, lack of transparency, and the reoccurrence of delay in the payment of retirees' benefits. With the continuous flaws in government programs over the decades to cater for the retirees, the scheme may not translate into financial well-being for the retired. Therefore, the need for government to review the effectiveness of the programs is paramount, and retirees should take responsibility for their financial well-being. This is because the retirement period can either be a pleasurable or agonizing experience depending on the retiree's level of financial preparedness. In addition, retirees are a vulnerable group in the society because of their weakened physical, psychological, and financial power which restrict their capability to labor and earn income when they retired.

In light of the above, government should review from time to time its pension laws in the public sector to reflect the inflationary, exchange rate volatility and other changing trends in the country especially the current impact of the COVID-19 (coronavirus) pandemic. This is to match retirees' earnings with economic realities. Also, government should encourage retiree's financial self-reliance by allowing them to attain entrepreneurial training in public institutions such as Small and Medium Enterprises Development Agency (SMEDA), Industrial Development Centre (IDC), and National Directorate of Employment (NDE). Furthermore, based on the experience arising from the past pension scheme's failures, this entry suggests that government should permit organizations to manage their own pension fund. This is to prevent external influence on their funds from government and save retirees from financial difficulty. Individuals' financial well-being is incumbent on their actions. Hence, retirees should reflect prudently on their financial planning and goals to achieve satisfaction.

## Synonyms

Funding nonprofit organizations; Sources of nonprofit revenue income

## Definition

| | |
|---|---|
| Charitable giving | Donation of money to an organization that benefits others beyond one's own family. |
| Contract | A legally enforceable agreement between two parties to achieve predefined results. |
| Earned income | Revenue generated from providing goods and services. |
| Endowment | An established fund of cash, securities, or other assets to provide income for the maintenance of a not-for-profit entity. |
| Foundation | A type of charitable organization that relies on one or just a handful of sources, derives ongoing funding from return on investments, and commonly distributes grants to public charities, for charitable goals. |
| Grant | An award of financial support to a nonprofit to achieve public goals. |
| Investment income | Income derived from interest, dividends, or capital gains on nonprofit financial assets, including returns on endowments, operating funds, or other restricted funds. |

## Introduction

Although raising funds is not the primary goal for nonprofit organizations, it is important for them to carry out their missions and be sustainable. As such, nonprofit leaders need to understand various sources of income that their organizations may rely upon. Below, we explain the major sources of income for US-based nonprofit organizations: individual donations, corporate and foundation giving, government grants and contracts, earned income, endowment, and debt instrument. Nonprofit organizations located outside of the USA rely on similar sources of revenue although the proportion of each may vary. The Johns Hopkins University study (Salamon et al. 2013), based on a survey of nonprofits in 12 countries, reported sources of income based on three broad categories: government funding, philanthropic giving (which includes individual and organizational giving), and fee-for-service (which includes earned and investment income). Nonprofits in these countries, on average, generate 43% of their revenue from fee-for-service, 32% from government funding, and 23% from philanthropic giving, with substantial country-to-country variations. (Based on 34 countries, another 2010 study reported that on average nonprofits in these countries derive 50% from fee-for-service, 36% from government funding, and the remaining 14% from philanthropic giving (Salamon et al. 2013). For instance, Kyrgyzstani nonprofits rely predominately on fee-for-service (85%), Belgian nonprofits derive 68% of their income from government sources, and philanthropic giving accounts for 84% of Mozambican nonprofits' total revenue. Below, we explain the trends of each type of revenue. Provided statistics are mostly based on US cases

but implications are relevant for most countries experiencing the growth of the nonprofit sector.

## Individual Donations

Broadly speaking, charitable giving is "the donation of money to an organization that benefits others beyond one's own family" (Bekkers and Wiepking 2011, p. 925). According to Giving USA (2018), total private contributions to US-based nonprofits in 2017 reached $410 billion, of which roughly 70%, or $287 billion, came from individual giving. Compared to 2016, individual giving in 2017 increased by 3.0% after adjusting for inflation. The disaggregated statistics, however, sends a warning sign to small nonprofits. Giving USA reports that individual giving to large nonprofits (>$500,000 in annual revenue) increased by 9.0%, while decreased by 8.2% for small nonprofits (<$100,000 in annual revenue). From a long-term perspective, all nonprofits that rely heavily on individual donations should pay more attention to the current giving trend. Since 1977, individual giving in the USA as a share of disposable personal income has remained largely stagnant, with the highest at 2.4% in 2000 and the lowest at 1.7% in 1995 (Giving USA 2018). Meanwhile, private giving as a percentage of total giving, which includes corporation and foundation giving, and bequests, has shrunk considerably from 83% in the five-year period between 1978 and 1982 to 71% between 2013 and 2017. Given the growth of the nonprofit sector, these trends suggest greater competition over individual donations.

There are various ways that social scientists explain charitable giving behaviors. Economists understand charitable giving as a result of tax incentives and "warm glow" effect. The rational choice perspective fails to explain why some donors make donations without taking advantage of tax benefits and thus overlooks the social construction aspects of giving. Psychologists, on the other hand, link charitable giving to individual characteristics, such as altruistic personality, prosocial beliefs, sense of community, and past experience with recipient nonprofit organizations. Finally, the sociological perspective highlights the role of social norms and networks in encouraging donations. For instance, the social expectations to contribute as well as the density of social networks account for more charitable giving among religious individuals. Sociological perspective also found that being asked by friends and family members or pressured by individual social status are important factors to explain the likelihood of giving or the amount of gifts.

## Foundation and Corporate Giving

A foundation typically relies on one or just a handful of sources, derives ongoing funding from returns on investments, and commonly distributes grants to public charities, for charitable goals. According to the latest report by Foundation Center (2014), there are about 86,000 foundations in the USA. Giving USA report (2018) shows that foundation giving, excluding corporate giving, accounted for 16% of total private giving in the USA, and of these, independent foundations constituted more than 74% of the total grants made, while operating foundations and community foundations gave at around 13%, respectively.

Foundations play an increasingly important role in policy change, innovation, and redistribution of wealth. Critics of foundations, however, argue that the redistributive mechanism of foundations may be subject to donor preferences and ideologies, especially in a relatively under-regulated environment. For instance, the vast majority (90%) of foundations primarily fund communities where they are located rather than where funds are most needed, with only 1% of grants dedicated to addressing social problems such as homelessness. Further, critics also say foundations often compromise their overall capacity to address root causes of community problems because grants are often project based with a limited times pan and prefer self-sustainable programs.

According to the Giving USA report (2018), corporations in the USA gave $21 billion worth of

cash and in-kind gifts in 2017 through internal corporate giving programs and corporation foundations. There are mainly three reasons why corporations engage in philanthropy. First, corporate philanthropy is a result of altruism and commitment to the common good. When corporations make philanthropic gifts, they do not expect anything in return and may do so out of social responsibility, which differentiate corporate philanthropy from sponsorship tied to marketing. Second, philanthropy brings indirect benefits for the corporations. By investing in the community where they operate, corporations can enjoy a better business environment that has a safer community, more educated workforce, and better developed infrastructure. Lastly, corporate philanthropy is an instrumental tool to improve public image, gain stakeholder support and political access, and, ultimately, enhance financial performance.

A number of organizational characteristics help predict the likelihood of corporate giving. First, corporations in oligopolistic markets are more likely to engage in philanthropy in order to gain a competitive edge. Second, corporations in the retail industry are more likely to give than their nonretail counterparts because of their need to appeal to their consumers and the broader public. Third, corporations that generate negative externalities, such as air pollution, are more likely to give to improve their image.

## Government Grants and Contracts

Government support for the nonprofit sector may come through not only direct forms but also indirect forms such as tax deductibility for charitable gifts and tax-exempt status. In this entry, we focus on direct forms of support, mainly contracts and grants. A contract is a legally enforceable agreement between two parties to achieve predefined results. The failure to deliver agreed upon goods or services may lead to legal consequences.

Contracts can be classified into two broad categories: fixed price and cost reimbursement. Under a fixed-price contract, the amount of funding through the contract is fixed in most cases, and nonprofit contractors often face a great deal of financial risk as they will be responsible for all expenses, which include indirect administrative costs and may exceed the total contract price. Under a cost-reimbursement contract, nonprofits get reimbursed up to a preset ceiling price. This arrangement is often less risky for contractors because there is more flexibility in the use of funds and the ceiling price is not easily exceeded. Within the two categories, the Federal Acquisition Regulation (FAR) specifies seven types of contracts based on liability and profit incentive (See Pettijohn 2013 for more information).

Grants, on the other hand, are awarded to nonprofits as a form of financial support to achieve public goals. Compared to contracts, nonprofits have more flexibility in how the grants are used, and the reporting requirements are less stringent. Although the funding mechanisms of contracts and grants differ, many studies do not differentiate between them when investigating public funding, but rather view them as a formal relationship with governments.

Government funding to nonprofits fluctuates with time and is heavily affected by political ideology. For instance, the number and amount of US government contracts to nonprofits increased sharply in the 1960s with the programs established during the war on poverty. Such practices, however, changed considerably in the 1980s as the Reagan administration delegated more responsibilities to the states and cut funding for a number of programs that are typically delivered through nonprofits. Overtime, government funding to nonprofits rebounded with the expansion of existing programs and creation of new programs. According to an urban institute (2012) report, governments of all levels worked with approximately 56,000 nonprofit organizations and entered into about 350,000 contracts and grants, valued at $137 billion. On average, these nonprofits have six contracts and/or grants with the median of three. The awarded nonprofits tend to be large in size, with only 17% of them having budgets of less than a quarter of a million.

The top three recipient subsectors are human service (53%); arts, culture, and humanities (13%); and heath (12%). The case provided here focuses on the relationship between US governments and nonprofits, but nonprofits across the world are heavily dependent on governments to finance their operations.

## Earned Income

Earned income is revenue generated from providing goods and services and accounts for more than half of the total income in the nonprofit sector. Since the late 1980s, the nonprofit sector has become increasingly commercialized for several reasons. First, significant cutbacks in government funding and stagnant private giving in the 1980s forced nonprofits to develop alternative sources of income. Second, social and demographic changes such as an aging population and increased labor force participation among women created a broader market for nonprofit services. Third, the growth of social service market, based on government voucher programs and other subsidies, attracted for-profit firms to enter industries that used to be dominated by nonprofits and forced nonprofits to compete against their for-profit counterparts. These forces created marketization of nonprofits, in other words, drove nonprofit organizations to adopt business-like practices and expand their earned revenues.

Some scholars raised concerns that the push for increasing earned income can compromise the traditional roles of nonprofits as value guardians, advocates of important issues, and creators of social capital. Other scholars, however, contend that organizations still need to increase earned income to be sustainable. Compared to donations and government funding, nonprofits typically have greater control over how much commercial revenue they generate and spend. Overall, the current literature recognizes both the benefits and risks associated with earned revenue and suggests that organizations must examine the nature of their mission to assess the appropriateness of earned income.

## Endowment

Investment income is derived from interest, dividends, or capital gains on nonprofit financial assets, including returns on endowments, operating funds, or other restricted funds. The Financial Accounting Standards Board (FASB) defines endowment as "an established fund of cash, securities, or other assets to provide income for the maintenance of a not-for-profit entity" (AICPA 2013, p. 145). Common sources of endowment funds include donor-restricted contributions and bequests, which may be used to generate income either permanently (true endowment) or for a defined period (term endowment). In addition, the governing body of a nonprofit may allocate a share of its unrestricted net assets for the establishment of a board-designated endowment fund, sometimes referred to as a quasi-endowment.

Nonprofits accumulate endowments for three primary reasons. Endowments (1) serve as a financial safety net against economic hardship; (2) help to maintain a nonprofit's reputational capital in the long run; and (3) ensure that certain values can be better handed down to future generations. Moreover, endowments give the impression to donors that their contributions will be in perpetuity, making a lasting impact.

An investment portfolio is a group of jointly managed assets, which may include cash and cash equivalents, stocks, and bonds. Scholars (Calabrese and Ely 2017) analyzed the statistics of income (SOI) data from 2008 to 2012, which includes mostly large nonprofits with at least $30 million in assets, and found that 43% of the nonprofits in the sample have endowments. The distribution, however, is highly skewed. Higher education nonprofits own 64% of the endowment assets, even though they constitute only 21% of endowed nonprofits. The total endowment growth from 2008 to 2012 is 34%, with substantial subsector variations: religious nonprofits'endowments increased by 91% while mutual benefits nonprofits'endowments shrunk by 26%. Of all endowments, 41% are permanently restricted, 33% are unrestricted, and the rest are temporarily restricted.

Investment income has stirred a debate among scholars known as the "today-versus-tomorrow." Expressing concerns over endowment accumulation, these scholars questioned the investment return of endowment relative to other opportunities that organizations can seize by using the money and the sacrificed current social benefits as a result of endowment accumulation. They have also raised the issue of fairness, in the sense that the current generation's subsidies of tax exemption are being used to generate income for future generations.

## Debt Instrument

Debt financing refers to financing through borrowing. Despite the borrowing costs, many projects, especially capital projects, can only be made possible through debt financing. The major types of debt instruments include lines of credit, bank loans, mortgages, and bonds (to understand the differences between them, see Yetman 2007). In short, lines of credit and bank loans are for shorter terms and smaller amounts, compared to mortgage and bond issuance. The use of debt financing has been on rise recently. For instance, the US nonprofit sector owed a total debt of $873 billion in 2010, representing a real growth of over 100% from 1998 (Calabrese and Ely 2016). Tax-exempt bonds made up almost half (45%) of total liabilities in the sector, followed by mortgages and notes (24%) and then other liabilities (16%). The top three nonprofit subsectors that utilize tax-exempt bonds are hospitals (54%), higher education (20%), and human services (11%).

There are several reasons why nonprofits use debt financing. First, it smooths out the gap between revenues and expenses. Many nonprofits, due to the nature of their revenue structures, receive payments or major donations at irregular intervals even though their programs require constant spending. Debt financing helps to offset the temporary shortage of working capital. Second, debt financing can facilitate capital asset purchases, as large sums of cash can take an extended period of time to raise, and the process may create adverse effects on the organization's day-to-day operations. Additionally, debt financing equalizes the cost of a capital asset throughout its useful life span and allows the benefits of the asset to offset its annual cost. Third, debt financing may also serve as a financial safety net to withstand unplanned events or as a reserve to seize emerging opportunities. Finally, debt financing can be used to re-finance the organization's existing fixed-rate debt as market interest rates fall.

F

## Conclusion

This entry introduced six types of financial sources nonprofits rely on to support their day-to-day operations as well as large capital projects. Unlike for-profit firms, nonprofits draw on a mix of these sources to support their missions. Their specific revenue portfolios are determined by the suitability and feasibility of acquiring these revenue sources. To help nonprofit leaders make informed decisions about which sources of income would best serve their needs; this entry provides a discussion of the definitions, characteristics, benefits, and potential challenges of each source.

# Firing Regulation and Public Administration

JiHye Park
Department of Sociology, University of Iowa, Iowa City, IA, USA

## Synonyms

Discharge; Public policy exceptions to the at-will doctrine; Termination

## Definition

Defendant: The person defending or denying in an action or suit (Legal Dictionary 2016).

Employment-at-will doctrine: Employers can fire employees at their discretion, while employees also can resign from their work positions at any time within the at-will doctrine (Muhl 2001).

Plaintiff: The party who sues in a civil action (Legal Dictionary 2016).

Public policy exceptions to the at-will doctrine: Under the public policy exception to the at-will doctrine, an employee can be wrongfully fired when the firing is against the well-established public policy. The purpose of the public policy exceptions is to protect both employees and public welfare (Muhl 2001).

Whistle-blowing: The disclosure by a person, usually an employee in a government agency or private enterprise, to the public or to those in authority of mismanagement, corruption, illegality, or some other wrongdoing (Legal Dictionary 2016).

## Introduction

Public administration and policy regulations govern the firing process (Shafitz et al. 2012). Under Wood's at-will doctrine (1877), American courts have respected freedom of employment; both employers and employees can fire their employment at their discretion. However, this at-will doctrine created disadvantages for the employees, such as job insecurity, while providing absolute privileges to employers in terms of power. With *Petermann v. International Brotherhood of Teamsters* (1959), American courts became aware of the growing number of wrongful firing cases, which violated public policy. In other words, the precedents illustrate that employers cannot fire their employees at will when the cause violates public good and welfare. In summary, public administration and policy regulate a firing decision as providing exceptions to the at-will doctrine.

The purpose of the current entry is to provide an overview of the changes in the at-will doctrine over time in the United States. The entry also offers an explanation of public policy exceptions to the at-will rule with related court cases and their decisions. Finally, this paper ends with organizational costs as the result of wrongful firing in violation of the public policy.

## Historical Background

Jacob was in love with Rachel and said, "I'll work for you seven years in return for your younger daughter Rachel." Laban said, "It's better that I give her to you than to some other man. Stay here with me." So Jacob served seven years to get Rachel, but they seemed like only a few days to him because of his love for her (Genesis 29: 18–20).

Biblically, Jacob and Laban's employment contract dictated 7 years of work for Laban in exchange for marriage to Laban's daughter, Rachel. The Bible recorded the shape of an employment agreement as a function of family relations, which influenced employment-related law to be classified as part of family law in Europe during the Middle Ages. Later, this view influenced the feudal doctrine in which employment between a master and servant could last an unlimited number of years. During the nineteenth century, the concept of a lifetime employment relationship changed to 1-year hiring under the British rules; employment could be fired only at the end of year (e.g., Labatt 1913).

These early British rules became the foundation of American employment doctrine. In 1877, Horace Wood first introduced the concept of at-will employment in his book *A Treatise on the Law of Master and Servant*. According to Wood (1877), hiring could be for unlimited years without contracts. This logic was written for value of freedom of employment; under this belief, both parties may leave their employment relationships whenever without constraint by the contracts. Wood's at-will rule was accepted by most American courts when understanding firing of employment, especially during the twentieth century. However, Wood's rule unwittingly set a pattern for wrongful firing cases in modern American society (DeGiuseppe 1981).

Between 1933 and 1938, the power of the government expanded to private economic and business sectors under Roosevelt's New Deal. Congress recognized that employers did over- and misuse the at-will doctrine for their advantage (e.g., by firing without a cause at any time). This recognition of wrongful use finally shed light on employee's rights – their vulnerability in power relative to their employers (e.g., *Larsen v. Motor Supply Co*., 1977). After a century of Wood's at-will doctrine, the courts specified exceptions to at-will employment. These exceptions including implied-contract exception, implied covenant of good faith exception, and public policy exception limit employers' discretion on employment firing decision (Muhl 2001). To be specific, the implied-contract exception only permits the employment firing with good cause. In addition, the implied covenant of good faith exception provides a fair relationship to employers and employees (e.g., fair contract). Lastly, the public policy exception limits the at-will doctrine when it violates the nature of public policy. Today, "the theory of wrongful firing in violation of public policy is used most often" (Winterbauer 1992, p. 388).

## Public Policy Exceptions to the At-Will Doctrine

In a narrow spectrum, the courts have subjected the public policy exception to only "statutory rights and criminal prohibitions" (Modesitt 2006, p. 402). Broadly, public policy refers to an administrative action and decision for public good and welfare which constitutes not only statutes and the Constitution but also includes administrative regulations, precedent, and codes of professional ethics (e.g., *Winkelman v. Beloit Memorial Hospital*, 1992). With respect to the definitions of public policy in the workplace, public policy functions to protect employees and employers and their relations, rights, and interests. This maintains the stability of the workforce. Wrongful firing in violation of public policy occurs when the employers fire their employees due to reasons that violate public policy, thus eventually harming not only the fired individual employees but also threatening public good and safety (e.g., *Smalley v. Fast Fare Inc*., 1988).

In the United States, the first recognition regarding wrongful firing in violation of public

policy was in *Petermann v. International Brotherhood of Teamsters* in California (1959). California legislature investigated the company's corrupt actions. Petermann, a business agent of the International Brotherhood of Teamsters, was required to testify about the corruption of the Teamsters Union. Despite pressure by his supervisor to perjure himself in court, Petermann testified truthfully about his company's corruption for the investigation. The day after his summons, Petermann was fired by the company. While the defendant appealed that the firing was based on the at-will doctrine, the court found that the company fired Petermann because he refused to involve in illegal activity for the company's benefit (i.e., false testimony). According to the California court's decision, perjury is a crime that harms public safety and social justice. The court's decision was based on the below reasoning (in part):

> It would be obnoxious to the interests of the state and contrary to public policy and sound morality to allow an employer to discharge any employee, whether the employment be for a designated or unspecified duration, on the ground that the employee declined to commit perjury, an act specifically enjoined by statute. (*Petermann v. International Brotherhood of Teamsters*, 174 Cal. App. 2d 184 (Cal. App. 2d 1959))

The California appellate court decided that Petermann's case represented a public policy exception to the at-will doctrine, and this case became the first American court case of the public policy exception to the at-will doctrine.

## Cases of Wrongful Firing in Violation to Public Policy

The court decision for Petermann's case inspired growing awareness of the wrongful firing cases that violated public policy, specifically during the 1980s (Ballam 2000). *Restatement* (*Third*) *of Employment Law* (American Law Institute 2009) categorized four cases of public policy exceptions to the at-will doctrine. In this section, four major categories that were clarified as the exceptions of the public policy to the at-will doctrine will be overviewed with related previous court cases.

The first exception of the public policy to the at-will doctrine is retaliation for exercising a statutory right. Precedents suggested that firing due to employees exercising their statutory rights was a wrongful firing that violated the nature of public policy. *Frampton v. Central Indiana Gas Co*. (1973) is a leading case in this area. The Central Indiana Gas Company fired Frampton after she sought a second compensation for a previously injured arm at work. When she injured her arm for the first time, the company paid fully her medical expenses and full salary for 4 months. In about a year and half, she claimed her second compensation for the injured arm due to a 30% loss in her use of the arm after the same accident. A month after this claim was filed, Frampton received compensation, and she was fired without any reasonable cause. The Supreme Court of Indiana explained that a compensation claim is a right of employment under Indiana Workmen's Compensation Act or the Indiana Workmen's Occupational Disease Act. Thus, the company's firing of the plaintiff could be considered a retaliation of her filing for compensation, which is a wrongful firing that violates the public policy (also see other related court cases: *Kelsay v. Motorola*, *Inc*., 1978; *Midgett v. Sackett Chicago*, *Inc*., 1985).

The second exception of the public policy to the at-will doctrine is retaliation for engaging in acts that are in the public interest. Many courts have prohibited the at-will principle for an employee's absence at work due to exercising their lawful rights, including joining National Guard and serving on a jury. *Nees v. Hocks* (1975) illustrates an example of this particular wrongful firing. The plaintiff postponed her first jury duty in 1972 and was called for the duty again in 1973. Her company requested her to postpone or shorten the serving periods. Finally, Nees took 2 weeks off to complete her legal duties, which started on February 26, 1973. Two weeks later, she was fired, receiving the following letter (in part) from her boss, Hocks: "Although we

asked you to request an excusal from Jury Duty and wrote a letter confirming the Labels [defendants'] position, it has been brought to our attention you, in fact, requested to be placed on Jury Duty." The letter became the evidence that Nees was fired by exercising her legal duty to uphold the public interest, not by unsatisfactory work performance. Thus, the decision of the Supreme Court was favorable to Nees, protecting her legal rights within exceptions to the at-will doctrine (also see related other court cases: *Segal v. Gilbert Color System Inc.*, 1984; *Reuther v. Fowler & Williams, Inc.*, 1978).

The third exception of the public policy to the at-will doctrine is retaliation for whistle-blowing. Precedents have illustrated that reporting a company's violation of the law is not a crime. Rather, this is an action for public safety and in the public interest. Thus, firing an employee for this reason has been banned by most courts in the United States. *Garibaldi v. Lucky Food Stores Inc.* (1984) is an example of a wrongful firing in retaliation for whistle-blowing. Garibaldi was a truck driver for Lucky Food Stores. While delivering milk, he found that the product was spoiled and reported this issue to his boss. However, his employer told him to deliver those spoiled products. Despite the supervisor's direction, Garibaldi informed the local health department on March 27, 1979. Garibaldi believed that his whistle-blowing subjected him to continuous harassment at his work, which allegedly resulted in his firing in October of 1980. While respecting the at-will agreement, the court (9th Cir.) protected the plaintiff's firing under the public policy exception to the at-will principle (also see other related court cases: *Panar v. Americana Hotels*, 1982; *Sides v. Duke Hospital*, 1985).

Finally, the fourth exception of the public policy to the at-will doctrine is retaliation to refusal to perform a criminal act. After *Petermann v. International Brotherhood of Teamsters* (1959), courts started to recognize that employee's refusal to do criminal act for a company's benefit, such as perjury, cannot be a cause of firing. Beyond the perjury case, many courts have respected employees' refusals to abstain from other illegal activities under the public policy exception to the at-will employment agreement, such as *Henze v. Alloy Surfaces Company* (1992). The Alloy Surface Company made a contract about supplying equipment for the US Military. Henze, the plaintiff, was a controller in the company, and therefore, his job was to decide the price of the equipment that would be supplied to the US Military. His supervisor forced the plaintiff to set the price higher than the federal regulation. When the plaintiff refused to engage in this activity, he was fired by the company. Therefore, the Delaware Court decided this case was a wrongful firing in violation to public policy on the basis of the Petermann opinion:

> To hold that one's continued employment could be made contingent upon his commission of a felonious act at the insistence of his employer would be to encourage criminal conduct upon the part of both the employee and employer and would serve to contaminate the honest administration of public affairs. This is patently contrary to the public welfare. (*Petermann v. International Brotherhood of Teamsters*, 174 Cal. App. 2d 184 (Cal. App. 2d 1959))

## Organizational Costs by the Wrongful Firing in Violation of the Public Policy

Wrongful firing in violation of public policy causes the organization to suffer both direct and indirect economic loss. First, lawsuits for the wrongful firing create costs for the organization, including compensation for the plaintiff's past and future lost wages, benefits, and any damages which resulted from the wrongful firing (Baucus and Dworkin 1998). For example, in *Stewart v. FedEx Express* (2015), the plaintiff received permission to continue his family's medical care despite being granted a leave of absence by FedEx. However, the company fired him for "job abandonment." In conclusion, the Pennsylvania Superior Court ordered $35,000 compensation for the plaintiff's damages. It was because FedEx failed to exercise the public policy

exceptions to the at-will doctrine by harming the employee's statutory right. Other organizational economic costs caused by the violation of the public policy exception to the at-will doctrine include legal fees (e.g., attorney fees) and fines and/or penalty under the False Claim Act (Harris 1994; Jefferson 1994; Schmitt 1993).

Beyond these direct economic losses, those agencies involved in wrongful firing would experience other types of negative effects. For instance, the company's reputation might suffer damage, thereby making the company less likely to attract future consumers and talented employees (Cowan 1992; Dworkin and Callahan 1993; Weitzman and McKenna 1995). Also, their future activities and actions will be more likely to be monitored and regulated by government administrations (Dworkin 1992; see Uniform Law Commissioners' Model Employment Termination Act, 1991).

## Conclusion

The erosion of the at-will employment agreement in the United States significantly accelerated during the 1980s as the courts recognized wrongful firing cases that violated public policy. Therefore, courts began to limit at-will doctrine by providing exceptions, for example, prohibition of firing employers when (1) exercising their statutory rights, (2) engaging in acts that benefit public interests, (3) whistle-blowing for public good, and (4) refusing to perform a criminal act. When companies violate public policy by the wrongful firing of employees, those companies acquire an unethical organizational image which leads to loss of trust by their consumers, current employers, and future applicants. Also, the lawsuits for the wrongful firing, or firing that violates public policy, result in a vast economic loss to the organization, due to the payment of legal fees and monetary compensation to the plaintiff. Therefore, it is necessary that employers use public policy to determine their decisions to fire at-will employees.

# Fiscal and Financial Transparency

Johann Seiwald
International Monetary Fund, Washington, DC, USA

## Synonyms

Budget transparency; Fiscal openness

## Definition

*Fiscal transparency* can be broadly defined as the state of openness and accountability in fiscal decision-making through which fiscal policy-making and implementation as well as budget preparation and execution processes are subject to greater public scrutiny. The IMF (2012) choses a more narrow definition and defines it as "the comprehensiveness, clarity, reliability, timeliness, and relevance of public reporting on the past, present, and future state of public finances." The OECD (2002) has chosen a synonym, *"budget transparency,"* defined in a similar narrow way as "the full disclosure of all relevant fiscal information in a timely and systematic manner."

*Financial transparency* is a less specific concept and does not specifically refer to fiscal policy-making but applies to a wider range of organizations and aims at the visibility or accessibility of financial information, especially concerning business practices of (public sector) organizations.

## Introduction

Providing publicly available financial information on the budget has been on the agenda of many countries for several years. Early attempts at open budgets and accounts tried to give parliaments or opposition sight of the budgets and was so a means for better control over governments. More recent initiatives are strongly driven by international organizations and nongovernmental initiatives and linked to the broader governance debate (accountability, participation, cohesive policy-making).

The remainder of this entry starts with an overview of the concept and the objectives of fiscal transparency, gives a brief outline of historic developments, describes the main international transparency initiatives of international organizations and nonprofit networks (which reflect developments in pioneer countries and drive enhancements of transparency), describes the main features of the standards and evaluation tools that were developed within the last 20 years, and concludes with a summary of results from studies on the impact of fiscal transparency initiatives.

## Concept and Purpose

Fiscal transparency means providing publicly available information about fiscal projections and plans, fiscal policy decisions, budgetary allocations and its use, and public sector accounts. The public domain refers to a broad range of stakeholders and includes all citizens (or interested group of citizens); governmental (e.g., parliament, fiscal councils, court of accounts), nongovernmental (e.g., press, investors, nonprofit organizations), or international organizations; and markets (e.g., financial markets, suppliers to public sector) with an interest in fiscal

policy and use of public funds (GIFT 2016; Philipps and Stewart 2008). Whereas fiscal transparency refers to the openness of fiscal policy-making for the entire public sector including its subunits, the less specific term financial transparency relates to visibility and accessibility of information of (public sector) organizations on their business practices, not focused on fiscal policy, and thus strongly refers to accounting standards. This entry primarily deals with the more specific concept of fiscal transparency and treats financial transparency as an integral of the latter part due to their overlapping nature, thus in the following the term fiscal transparency is used.

Fiscal transparency aims to provide information about the fiscal stance and fiscal plans of a country that facilitates policy analysis. It strives for evidence-based and better-informed economic decisions by governments. Openness of fiscal and financial information helps ensure that governments are held accountable for their fiscal policy and budgetary actions and that stakeholders have resources to scrutinize fiscal policy decisions, budgetary documents, and budget execution (IMF 2014a). The credibility of fiscal decisions is assumed to increase as political commitment is enhanced. Risk for gimmicks and opportunistic goals are reduced because openness is considered to put governments at a reputational, political risk when implementing and pursuing unsustainable policies and inadequate decisions.

These indirect or intermediate effects should lead to improved fiscal performance, more efficient and effective use of public funding, more resources for development priorities, and reduced corruption. Enhanced credibility is considered to even contribute to lower borrowing costs (IMF 2012). Nontransparent behavior, on the other hand, creates a huge potential for inefficiency and risks for financial crises (IMF 2012). Open finances are thought to strengthen trust for citizens and empowers them to participate in political decision-making, and a more democratic fiscal policy-making approach can be pursued. Fiscal transparency paves the way for applying a more participatory way of budgeting (GIFT 2016).

In addition, international organizations (such as IMF, OECD, or World Bank) have a particular interest in fiscal transparency as it facilitates their surveillance activities of fiscal position and developments (Philipps and Stewart 2008). Their standards also support implementing good complementary practices of public financial management beyond pure transparency (e.g., fiscal rules, borrowing limits, budget approval).

## Historic Developments

First attempts of fiscal transparency were found for governments of ancient and medieval Europe. This openness, however, was undermined by the desire of the rulers to keep "things" secret, the limits of technology, and low rates of literacy (Irwin 2013). Absolute monarchies of the sixteenth and seventeenth centuries reversed this trend and restricted access to budget information.

Influential writers in the late 1700s paved the way for a new era of fiscal transparency. They stressed that governments should be accountable to the citizens and emphasized the value of reasoned and informed debate choosing policy. That thinking and concerns of taxpayers and their representatives contributed to increases in fiscal transparency in the late 1600s in England and most notably the publication by the French government in 1781 of a report on public finances (Irwin 2013).

In the early 1800s, European countries started incorporating into their Constitutions the requirement to publish governments' budgets and accounts, which happen by 1850 by all of them. The transparency movement was driven by the need of rulers to persuade creditors to lend and Parliament to approve new taxes. It was also facilitated by technological innovations that reduced the costs of distributing information (Irwin 2013).

In the 1980s, governments' dependency on financial markets (especially in advanced countries), the increasing influence of credit rating agencies, and donors' push in developing countries made fiscal transparency a globalized phenomenon (Philipps and Stewart 2008). Whereas earlier initiatives and pressure for more fiscal transparency came from national institutions, nowadays there are international organizations

(e.g., World Bank, IMF, OECD) and international NGOs (e.g., Open Budget Initiative) which drive the development of transparency standards and try to push them to national governments.

## Global Initiatives for Fiscal Transparency

In 2002, the OECD issued *Best Practices for Budget Transparency* as a reference tool for its member and nonmember countries. It lists the principal budget reports (e.g., budget, in-year reports, year-end report) that governments should produce and describes their recommended general content and specific disclosures (e.g., macroeconomic assumptions, tax expenditures, contingent liabilities). This includes both financial and non-financial performance information (e.g., sector policy objectives) and practices for ensuring the quality and integrity of the reports (OECD 2002).

In 2015, the OECD issued *Recommendations of the Council on Budgetary Governance*, which is comprised of ten principles and incorporates the best practices for budget transparency. Budgetary governance is defined "as the processes, laws, structures and institutions in place for ensuring the budget system meets its objectives in an effective, sustainable, and enduring manner" (OECD 2015, p. 1). One principle on budget transparency is defined, in a narrow sense – to ensure open and accessible budget documents. The other principles also refer to aspects of budget transparency in the broader sense.

The IMF first published a *Code of Good Practices on Fiscal Transparency* in 1998 and conducted assessments of countries' fiscal transparency and adherence to the principles and practices in the Code. The Code included four dimensions: (i) clarity of roles and responsibilities, (ii) open budget processes, (iii) public availability of information, and (iv) assurance of integrity (IMF 1998). In 2014, the IMF developed a new *Fiscal Transparency Code* in which the lessons learned from the global financial crisis were incorporated. The revised code focuses much more on outputs than processes, and fiscal risk analysis and management were strengthened. The new code consists of the three core pillars (IMF 2014a): fiscal reporting, fiscal forecasting and budgeting, and fiscal risk analysis and management. Specific to the IMF, fiscal transparency principles is a fourth pillar of transparency for natural resource revenues (e.g., from oil or gas). Transparency practices and institutions are classified for 36 dimensions according to a basic, good, and advanced practice scheme. The IMF provides a "Fiscal Transparency Evaluation" to its member countries based on this code.

The *Global Initiative for Fiscal Transparency (GIFT)* is a "multi-stakeholder action network" with the World Bank, the IMF, the International Federation of Accountants (IFAC), and the International Budget Partnership, but ministries from Brazil and Philippines. Its mandate is to drive the development of global norms on fiscal transparency, participation, and accountability and improve fiscal transparency around the world. The network has developed 10 "principles of fiscal transparency" and launched 10 "principles of public participation in fiscal policy" in 2016 (GIFT 2016).

The *Open Budget Initiative* conducts the "Open Budget Survey" based on a questionnaire with more than 100 indicators on openness of budget documents, integrity, and participation in the budget process. The review in the single countries is undertaken by civil society or academia, independently reviewed with the opportunity for governments to comment (International Budget Partnership 2015).

In 2010, the World Bank launched the *BOOST* initiative (BOOST is not an acronym but the name of a new data tool), which is an open budget database with detailed expenditure information of the included governments. Currently the platform includes expenditure data for around 40 countries for the use of researchers, government officials, or citizens (World Bank 2016).

*Public Expenditure and Financial Accountability (PEFA)* (2016) is a widely used and well-recognized standard for assessing the quality of public financial management systems in general. It includes some specific indicators for fiscal transparency (e.g., public access to key financial information, transparency of intergovernmental fiscal relations) and a wide range of indicators

overlapping with dimensions covered by other standards (e.g., extent of unreported government operations, orderliness and participation in the budget process, quality of financial statements).

The International Organization of Supreme Audit Institutions (INTOSAI) issued the *Principles of Transparency and Accountability* with a focus on governance and transparency related to audit (ISSAI 21). For example, they recommend state audit institutions to make their mandate and mission public, operate under a clear legal mandate, and apply high standards of integrity for staff.

Accounting and financial statistics standards also aim at increasing transparency of public finances but with a narrower scope. *International Public Sector Accounting Standards* (IPSAS) focus on *ex-post* reporting for year-end financial statements and rules for recognition, measurement, and disclosure of financial and nonfinancial transactions. The *Government Finance Statistics Manual* (GFSM, latest version 2014, previous versions 2001 and 1986, IMF 2014b) is an international statistical standard issued by the IMF and describes the macroeconomic statistical framework, and the published GFS year book provides a basis for comparative fiscal analysis. Other international statistical standards are the System of National Accounts (SNA) issued by the United Nations or regional standards, for example, European System of Accounts (ESA).

## Principles and Content of Fiscal Transparency Norms

The different standards and tools cover different dimensions. Although each standard has a particular focus, they share similar principles and have significant overlaps. In 2016, the OECD works on a toolkit to consolidate the different standards. In this section, the common principles, main content, and dimensions of fiscal transparency norms are presented, namely, concerning: (i) what information is to be provided, (ii) standards regarding how the information is to be presented, (iii) mechanisms for ensuring credibility and integrity, and (iv) specific governance-related issues.

### Information to be Provided

All frameworks require information on (i) fiscal policy planning and budgeting, (ii) analysis of fiscal risks, (iii) *ex-post* reporting, and (iv) nonfinancial performance.

Beyond the traditional annual budget information, documents which guide fiscal policy are to be published. These include fiscal rules and objectives, fiscal projections, and medium-term budget frameworks. For assessing the credibility of fiscal policy, macroeconomic assumptions (e.g., GDP growth, inflation, unemployment) are required to be disclosed too. The IMF (2014a), but also the "Open Budget Survey" (International Budget Partnership 2015), put a strong emphasis on reconciliation of successive fiscal plans to understand the reasons for deviations over time: Were fiscal plans revised due to macroeconomic revisions, implementation of new policies, or changes in parameters (e.g., number of beneficiaries of social benefits)?

Disclosure and analysis of fiscal risks has become a priority in fiscal transparency. Based on the analysis of government finance developments of the fiscal crisis, the IMF has included a separate section of fiscal risk disclosure and management. This includes macroeconomic risks but also risks from guarantees, public enterprises, financial sector exposure, PPPs, subnational governments, environmental risks, and others. Information indicating long-term sustainability is also required due to long-term effects of many policy decisions and to initiate fiscal policy decisions in a timely way. One focus of this kind of analysis is to assess the sustainability of pension systems.

For *ex-post* reporting, regular in-year and end-of-the-year budget execution reporting as well as audited financial statements are core documents. In general, standards express a strong preference for accrual based information (comprising a balance sheet and operating statement in addition to a cash flow statement) and so providing a broader range of financial information (including systematic information on assets and liabilities). Open budget surveys assess the availability of specific information disclosure including, composition of taxes and nontax revenues, debt, transfers to subnational governments, public

corporations, and donor money, or expenditure for governmental programs. The IMF (2014a) *Fiscal Transparency Code* specifically mentions tax expenditures, i.e., exemptions from taxation.

Currently, many budgets exclude extra-budgetary funds (e.g., social security) and state-owned enterprises. All frameworks, thus, emphasize to extend the scope of reporting beyond mere budget coverage. The GFSM (IMF 2014b) requires general government reporting (excluding public corporations), but the IMF *Fiscal Transparency Code* suggests whole of government reporting for the entire public sector (including financial and nonfinancial public corporations) as advanced practice. The argument is a risk-oriented approach as many organizations outside the general government can create fiscal implications, e.g., governments' guarantees for debt of public enterprises as the government might have to step in, central banks subsidizing lending for enterprises or banks instead of subsidizing through the budget (IMF 2012).

Best practice of countries is to complementing financial information with integral nonfinancial information. International standards encourage disclosure of "the outputs [the governments] are producing with the resources entrusted to them, and the anticipated and actual social, economic and environmental outcomes" (GIFT 2016). The OECD choses a broad approach including use of performance information, evaluation, and *ex-ante* reviewing of expenditure programs, in addition to pure presentation. Reporting on public investment including cost benefit analysis is also highlighted.

### Presentation of Information

For ensuring transparency not only substance but also the form in which the information is presented and made available matters. Good practices relate to: (i) form and timing of presentation, (ii) presentation for different target groups, (iii) classification, and (iv) alignment of different documents (e.g., International Budget Partnership 2015; IMF 2014a; OECD 2015).

Fiscal reports should be accessible to citizens, civil society organizations, and other stakeholders. The "Open Budget Survey" (International Budget Partnership 2015) requires online availability and machine readable documents. INTOSAI suggests in its standard ISSAI 21 that audit results are to be communicated through *media*, websites, and other means.

For budget documents to be impactful, they should be prepared frequently and in a timely manner. The IMF (2014a) *Fiscal Transparency Code* proposes submission of the budget to Parliament 3 months before the end of the fiscal year and approval of Parliament 1 month before the end of the fiscal year as most advanced practice to allow sufficient time for scrutiny.

In general, budget documents are targeted towards specific target groups (e.g., bureaucrats, fiscal analysts, politicians) and require specific, technical knowledge to be understood. A citizen budget or budget summary, however, presents the budget information in a less technical manner and makes budget information accessible to a broader, nonexpert audience (International Budget Partnership 2012).

A multidimensional budget analysis can be prepared if budget information is presented according to the different types of expenditure/revenue classification: economic (e.g., personnel, investment, interest), functional (e.g., health, defense, education), and programmatic (related to the objectives to be achieved, e.g., poverty reduction, housing). Whereas economic and functional classifications are standard requisites of a transparent budget, the international standards put a strong emphasis on the presentation of budget information on a program basis, because it allows better insight for which purpose public money is spent.

Transparent fiscal documents have to be read together, e.g., budgets over time, budgets to outturn, all budget documents over the budget cycle. Presenting the information on a comparable basis ensures comparisons, strengthens accountability, and allows different analyses. Historic revisions in budgets or accounts are to be disclosed as well as successive forecasts reconciliations, so that the development can be clearly followed.

### Credibility/Integrity Mechanisms

Public availability of pure information is not a sufficient condition for transparency.

Information has to be credible and reliable, thus mechanisms that ensure credible information are integral part of fiscal transparency. Such mechanisms include (e.g., IMF 2014a; OECD 2015): (i) accurate accounting and independent auditing, (ii) statistical integrity, (iii) independent assessment of fiscal policy, and (iv) compliance with procedural rules.

Governments' financial statements should show a true and fair view and present comprehensive, accurate, and reliable accounts. This can be ensured by complying with international or national accounting standards (e.g., IPSAS) and by independent audit of the accounts. The "Open Budget Survey" (International Budget Partnership 2015) assesses in terms of credible auditing, for example, the statutory independence of the state audit institutions from the Executive, its mandate, access to information, and appropriate resources to audit and report publicly. In their operations, audit institutions are required to operate in an independent, accountable and transparent manner. INTOSAI's standards (ISSAI 21) make state audit institutions subject to credibility requirements, e.g., objective and transparent audit standards, independent and external review of transparency standards, and a requirement for publicly reporting of audit results. Internal audits also enhance credibility.

As financial statistics are not subject to a professional audit, other mechanisms ensure its credibility. The IMF (2014a) *Fiscal Transparency Code*, in line with its statistical standards, requires that a professional independent body, i.e., an independent statistics office, is in charge of compiling the data and they are disseminated in accordance with international statistical standards.

Fiscal objectives setting and assessment are given a high priority in recent transparency standards, and after the 2008/2009 fiscal crisis more varied and complex fiscal rules and objectives have been developed. As a complementary institution, many countries established independent fiscal councils, such as most countries in the European Union, Canada, Chile, South Africa, South Korea, or the United States, to act as watchdogs for sustainable fiscal policy. They evaluate the credibility of governments' economic and fiscal forecasts, assess performance against fiscal objectives, and promote fiscal transparency not only through their own reports but also by demanding additional information from governments (IMF 2014a).

Procedural rules (e.g., parliamentary approval of budgets) set out in the fiscal legislation aim at reducing the risk of undermining fiscal transparency. For example, supplementary budgets should be approved by Parliament so that revisions to the budget follow a clear procedure and can be tracked, guarantees should be authorized by law to not circumvent budgetary approval mechanisms, and budget reserves allocated following procedural and material conditions to ensure public money is used according to clear principles.

### Embedding into Governance

Fiscal transparency is embedded in the broader debate of (fiscal) governance and linked to other governance principles such as: (i) the rules of law, (ii) participation, (iii) accountability, and (iv) others.

The GIFT principles highlight the rules of law in their first principle (GIFT 2016): "Everyone has the right to seek, receive and impart information on fiscal policies. To help guarantee this right, national legal systems should establish a clear presumption in favor of the public availability of fiscal information without discrimination. Exceptions should be limited in nature, clearly set out in the legal framework, and subject to challenge through low-cost, independent and timely review mechanisms."

They further specify that all financial transactions (including revenues) of the public sector should have their basis in law. Laws, regulations, and administrative procedures regulating public financial management should be available to the public, and their implementation should be subject to independent review (GIFT 2016). INTOSAI's ISSAI 21 recommends auditors to perform under a legal framework and make their mandate and responsibilities public.

Provision of credible fiscal information to the public ensures accountability and enables the public to participate in fiscal policy and budget decisions. Participation has become a central element

of fiscal transparency standards. The "Open Budget Survey" looks into information provided to the public enabling participation but also public hearings and other mechanisms to identify citizen's perspectives on budget priorities and to provide feedback regarding how the information was used (International Budget Partnership 2015).

Linkages of transparency to other governance dimensions refer to clarity of the public sector definition and private sector relations, clearly defined division of labor in the financial process, ethical standards for staff, or evaluation of expenditure programs (GIFT 2016; IMF 2014a; OECD 2015).

## Conclusion

Fiscal transparency has been given broad attention by international organizations and initiatives, and in line with these developments, national governments have improved their fiscal openness. The "Open Budget Survey" of 2015 (International Budget Partnership 2015) shows some progress but still highly divergent practices of the different countries. While around one fourth of the 102 included countries score well on budget transparency, most of them have significant deficiencies in participation. One-third of budget documents that should be published worldwide are not available to the public. Either they were not prepared, were for internal use only, or were published too late to be useful. However, the survey concluded a gradual trend toward improvements in budget transparency. Scores improved on average by 10% compared to the first survey in 2006.

Academic studies, however, show that fiscal transparency has positive aspects. Several studies, summarized in De Renzio and Wehner (2015), have analyzed the state of fiscal transparency measured by scoring according to the IMF *Fiscal Transparency Code* or the "Open Budget Survey". Whereas causal relationships are rarely made in the studies, most claim beneficial impacts on lowering deficits or debt, borrowing costs, and limiting fiscal gimmickry (De Renzio and Wehner 2015; IMF 2012).

While international standards help initiate transparency reforms and guide transparency initiatives of governments, the complex net of international standards have not yet reached the stage of a coherent complementary framework. After the stage of recently undertaken revisions and innovations to update the frameworks, a step towards harmonization would be beneficial. This process is facilitated by the fact that main players in the field are interrelated in the different initiatives.

The focus in international transparency standards is currently on the provision and presentation of information including credibility mechanisms. However, there is a lack of insight regarding how fiscal information is used by the different stakeholders. The single initiatives highlight the importance of using the public available information for decision-making, analysis, or accountability purposes. Probably also as a consequence of this unexplored relationship, the IMF *Fiscal Transparency Code* or the "Open Budget Survey" have not included more operationalized criteria for measuring if and how the information is used.

Whereas fiscal transparency has a positive connotation and is broadly considered as desirable, also supported by some studies and international efforts, risks of information overflow, unfavorable cost-benefit considerations of information disclosure, and negative impacts of fiscal transparency (e.g., on financial markets) could undermine fiscal transparency attempts. The implication of these limiting phenomena and the use of publicly available information in fiscal policy-making, for accountability and inclusion of stakeholder purposes, is not sufficiently explored and needs more attention, both in research and practice.

Bureaucratic autonomy; Financial autonomy; Financial decentralization; Fiscal administrative discretion; Fiscal delegated authority

## Definition

Fiscal decentralization refers to a governance arrangement where moneys are sent from the central government to local government units (districts/municipalities) with the objective to support the implementation of development programs and projects. The concept describes a situation where local government units are given the autonomy to select and implement programs and projects they deem as most relevant and appropriate in their respective jurisdictions.

## Introduction

Local and regional governments (LRG) are key stakeholders in the quest to accomplish the United Nations (UN) Sustainable Development Goals (SDGs). This is because they are the primary actors expected to translate the SDGs into action custom-made to the most pressing needs of their respective communities. However, their specific roles and resources to help accomplish the above have not received the prominence it deserves (Smoke 2017). Additionally, Conyers (1990) observes that compounding the situation in most developing countries is the colonial legacy of a

centralized system of government. Most independent developing countries in the early stages of their freedom either maintained the central control and centralized system of planning or strengthened it with the objective of shoring up popular support for their new policies. As a result, majority of these countries have not undergone the kind of evolution (decentralized system of planning) that seems more characteristic of the industrialized countries (Oates 1993).

Earlier studies in many developing countries report overwhelming consensus that decentralization is the mechanism to encourage participation of the local populace and make policies more responsive to local needs (Conyers 1990; Dick-Sagoe 2020). Decentralization is understood to be assigning public functions to local and regional governments along with systems and funds to support implementing these responsibilities to meet public goals. Its multiple forms may include deconcentration (assigning task and functions from central to local units), devolution (local units given some level of autonomy to take decisions), and delegation (certain function(s) contracted to a local unit or private entity). Also, its dimensions may constitute administrative, fiscal, and political (Smoke 2017).

More importantly, the dimensions of decentralization as mentioned above tend to be stronger and impactful when there is integration. For instance, political decentralization (elections) means little unless LRGs have the resources and capacity to respond to their constituents (Oates 1999; Suberu 2019). According to Oates (1999), finance is considered the fulcrum to any effective implementation of decentralization programs. Smoke (2017) buttresses this viewpoint with the argument that the ability of the central government to devolve financial arrangements in favor of decentralized units demonstrates the commitment of the central government to succeed with decentralization. Smoke (2001), for example, identifies three relevant factors that supports the importance of fiscal decentralization. First, it is a means of augmenting the inability of the central government development planning to promote and deliver adequate development. Second, the participation of local governments helps to deliver basic social services since local governments are better equipped to deal with local issues in which their daily life reflects. Third, the global political climate supports this as a means of promoting development and to channel economic resources. In many developing and in particular African countries, decentralization has been touted as a means of escape from the traps of poor governance, and its subsequent negative effects on economic growth, poverty, and income inequality (Atisa et al. 2020; Bird and Vaillancourt 1998).

In light of the expected benefits of decentralization, the framers of Ghana's most recent Constitution in 1992 instituted in Article 240(1) that Ghana shall have a system of local government and administration which shall, as far as practicable, be decentralized. This system of decentralization is expected to exhibit the following features; thus, first, parliament should enact laws to ensure that functions, powers, responsibilities, and resources are at all times transferred from the central government to local government units in a coordinated manner; second, local governments should have the necessary capacity to plan, initiate, coordinate, manage, and execute policies in respect of all matters affecting the people within their areas; and more significantly, each local government unit should have a sound financial base with adequate and reliable sources of revenue (see Article 240(2a–c)). It is important to point out that local governments in Ghana are labeled as assemblies and have been termed "Metropolitan" (population over 250,000), Municipal (one-town assemblies with population over 95,000), or District Assemblies (population of 5000 and over). An assembly is the pivot of administrative and development decision-making in the district and the basic unit of government administration.

The pillar of Ghana's fiscal decentralization is the District Assemblies Common Fund (DACF) which has the objective to support the implementation of District Development Programs as well

as leading the development priorities of the district to be accomplished on the principle of subsidiarity. As the backbone of Ghana's decentralization, the DACF deserves the necessary prominence in both academia and practice. It is based on this line of thinking that this write-up discusses the nature of Ghana's DACF placing emphasis on its design, implementation challenges, and its potential for effective local governance.

## Nature of Ghana's Fiscal Decentralization

In Ghana, two (2) types of funding exist at the Metropolitan, Municipal, and District Assemblies (MMDAs): internally generated funds (IGFs) (from licenses, taxes, and investment income, among others) and those transferred from the central government. The funds from the central government to the MMDAs include the District Assembly Common Fund (DACF) and the District Development Fund (DDF). The DACF is a statutory payment by the central government to the local governments from the national budget. Under DACF, the government is mandated to transfer 5% (now increased to 7.5%) of national tax revenue to a fund. The DACF is disbursed to the local governments on a quarterly basis per formula approved by the parliament of Ghana annually. Since its introduction in 1993, this has proven to be the most reliable form of transfer from central government to the local government units. On the other hand, the DDF is a performance-based fund. It is given to local governments based on performance following the implementation of their proposed development activities. An annual assessment of Metropolitan, Municipal, and District Assemblies performance is carried out using the Functional Organizational Assessment Tool (FOAT). Local governments that pass the assessments are provided with additional funds. A greater portion of the facility comes from Ghana's foreign development partners (Oduro-Ofori 2016). This entry, however, focuses on the DACF because of its central role in Ghana's decentralization scheme.

### The District Assembly Common Fund

The Two Hundred and Fifty-Second Article of Ghana's 1992 Constitution introduces the District Assemblies Common Fund as a mechanism to ensure effective provision of requisite funding to MMDAs to enable them implement their development programs and plans. In distributing the DACF to the various MMDAs, four basic factors are considered as criteria. These include the need factor, which addresses the imbalance in development and infrastructure among the districts, with the level of need determined from the GDP per capita. The second is the equalizing factor, which also aims at ensuring that districts have a minimum allocation from the Fund. The third is the responsiveness factor, which looks at rewarding assemblies that have done well in revenue collection in terms of per capita revenue collected. And the final factor is service pressure, which serves to compensate for population pressure on facilities. It must be highlighted that part of the fund that is disbursed directly to the MMDAs per the approved formula becomes what is known as the direct transfers, whereas aspects of the funds to support district projects that are national in scope become the indirect transfers. Also, about 4% of the Fund is shared with Members of Parliament for constituency projects, one and a half percent is shared among the 10 Regional Coordinating Councils for the supervision of the assemblies in their respective regions, while 2% is reserved to meet contingency expenditures (Nai 2014).

## The Prospects of Ghana's Fiscal Decentralization

The potential benefits of the DACF is aptly captured in its vision as "an institution of choice for the administration and transfer of funds to MMDAs to reduce poverty in their respective areas of jurisdiction." The DACF has reenergized the district assemblies in carrying out their core mandate of bringing development to the local people. The Fund has given district assemblies some sense of financial autonomy where they can decide which projects or programs to roll out that will be beneficial to all citizens. Also, one important factor that goes in favor of the DACF is

the fact that it has decentralized infrastructural development and increased participation of people at the local level. Rural electrification, road construction, health facilities, community water systems, and the like are gradually getting to the remotest and previously inaccessible areas of the country. A sustained effort will eventually lead to a greater expansion of these projects to cover every part of the country.

## Challenges of Ghana's Fiscal Decentralization

Despite the above prospects, the DACF is not immune to challenges. The first and often most talked about challenge is the unreliability and delays in the flow of funds to the districts, which constrain development especially the districts that are not revenue-endowed internally. There are countless examples where payments into the Fund have delayed for more than 1 year, resulting in the failure to disburse monies to the MMDAs in spite of the fact that the creation of the DACF and the payment of funds into the Fund is a constitutional requirement.

Again, there have been complaints from the general public and media of alleged misapplication and financial malpractices in connection with the disbursement and use of the proceeds of the DACF. This has been accompanied with tensions between Metropolitan, Municipal, and District Chief Executives (MMDCEs) who are appointed by the president to represent his interests, the Members of Parliament (MPs) who are the elected representatives, and then the traditional authorities often regarded as the custodians of the customs, culture, and natural resources of the people. Also, it is observed that Ghana and other developing countries assign more expenditure functions to sub-national governments than revenues allocated to these sub-national governments, leading to a mismatch of functions and finance in their intergovernmental fiscal relations (Yeboah and Andrew 2020). In addition, the lack of accurate and in some cases unavailable data has been one of the Achilles heel with regard to the funds effective disbursement. Formal data from the Ghana Statistical Services and other agencies, for example, doctor-to-patient ratio, nurse-to-patient ratio, teacher-to-pupil ratio, road coverage, and water coverage, among others, sometimes, do not correspond with the situation on the ground in the MMDAs. Furthermore, the complaints about the many deductions "at source" from the amounts meant for the MMDAs pose a major challenge and disrupts the payment plans they make for their projects.

Finally, the low financial, institutional, and political capacity levels of district assembly members and officials, local CSOs, and large segments of the population in general in dealing with budget issues have been detrimental to the effective functioning of the MMDAs and the disbursement of the DACF (Kaye-Essien 2020).

## Conclusion and Policy Implications

The entry shows that Ghana has embarked on decentralization for nearly 30 years with some success; however there are some constraints hindering the smooth implementation of the program. The highlight of Ghana's decentralization program particularly with its funding arrangements is the support from Article 252 of Ghana's Fourth Republican Constitution which is supported by an Act of Parliament otherwise referred to as DACF Act 1993 (Act 455). These legal provisions mandate Ghana to disburse not less than 7.5% of the country's revenue to the various MMDAs based on the criteria of needs, equalizing, responsiveness, and service pressure factors. It must also be mentioned that the DACF has energized the financial status of all the MMDAs with the hope of receiving an amount from the central government. The challenges of delays in the disbursement of the funds at the local level, inaccurate data as the basis of disbursement, many deductions at the source of the fund, and low capacity of district officers to handle financial matters continue to bedevil the effective administration of the funds.

In light of the identified constraints, the following recommendations are made. First, there is the need to intentionally and deliberately set up a reliable database through effective research and data collection strategy. This database should be regularly updated to enable the MMDAs to forecast, levy, and collect revenues due them. This

will also come in handy for the administrator of DACF in performing its disbursement role. Second, efforts should be made as a matter of urgency to appraise the operations of the DACF and identify the cause of the delays in the flow of revenue to the local government units. Third, the central government should provide leadership by strengthening their supervisory and monitoring functions and partner public training institutions to develop programs to equip and build the capacity of the MMDA staff in financial management and budgeting, general management and coordinating skills, and monitoring and evaluation techniques as and when necessary. The DACF in no doubt has been a fulcrum around which all the activities of the MMDAs revolve and its absence may have caused the demise of most MMDAs. Despite this, MMDAs must step up their internal revenue mobilization efforts in order not to over rely on the central government for funding. MMDAs can support the street naming and property addressing system programs by government that will enhance revenue mobilization in their respective jurisdictions.

# Fiscal Federalism and Sub-national Bond Yield Spreads: The Swiss Case

Roland Hofmann
School of Management and Law, Zurich University of Applied Sciences, Winterthur, Switzerland

## Synonyms

Default risk premium; Federal government tiers; Second state level; Sub-national government bonds; Swiss cantons

## Definitions

### Fiscal Federalism

Federal states consist of at least two tiers of government. In federal states, the sub-national tiers do not act exclusively as agents of the central level. They are (at least to some extent) autonomous and can decide for themselves on the organization and performance of the public tasks assigned to them in the Federal Constitution, as well as on the necessary expenditure and taxes (*principle of autonomy*). The *principle of fiscal equivalence* implies that, within a given jurisdiction at the different federal tiers of government, the costs of providing public goods and services should be covered and funded by those who enjoy their benefits and decide upon it. In a financially stable federalism, decision-makers, taxpayers, and beneficiaries should overlap to the highest possible degree *(institutional congruence)*.

### Sub-national Bond Spreads

*Spread* is the difference between the yield of a risky bond and the yield of a risk-free bond (*benchmark*) with otherwise identical conditions (in particular maturity, liquidity, or interest coupon). The spread serves as a measure of the credit risk of a bond. Bonds issued by sub-national governments (which are subject to risk) have a yield spread over the (risk-free) bonds issued by the central government. The spread reflects the difference in the default risk.

## Introduction: Sovereign Defaults and the Market Discipline

Stable public budgets are an important prerequisite for the orderly development of the social and political life in a country. However, political upheavals and distortions due to financial difficulties of states are often documented in history. Internationally, there has been a sharp increase in government spending and activities in all industrialized countries since the middle of the nineteenth century and increasingly in the twentieth century (Blankart 2011a: 157 ff; Hindriks and Myles 2013: 89–91, 99). This expansion was primarily attributable to social and welfare programs (education, health, pensions) with corresponding transfer expenditure. After 1960, however, rising revenues lagged behind growing expenditures in many industrialized countries. The recurring deficits led to a marked increase in debt in relation to economic output (Tanzi and Schuknecht 2000: 50 ff.).

In principle, public debt is neither good nor bad. Debts smooth unsteady income (taxes) over time and can finance long-term infrastructure investments to share the financial burden over generations of users (Blankart 2011a: 375 ff; Reinhart and Rogoff 2008). Debts become a problem for governments if they grow faster than economic output over a longer period of time, leading to a rising interest burden. A public budget is sustainable if the debt ratio (debt in relation to economic output) can be stabilized (Blankart 2011a: 370 ff.).

The propensity of governments to recurrent structural deficits and thus to rising debt is widely discussed in the literature (Reinhart and Rogoff 2008; Blankart 2011a: 166 ff., 361 ff.; Hindriks and Myles 2013: 119; 123 ff.). The financing of public tasks by means of debt instead of tax revenues is fundamentally attractive. Debt enables political decision-makers to incur expenditures for which they do not have to levy unpopular taxes ("to spend without to tax"). Governments accumulate not only a lot but often *too* many debts. Excessive debt is not uncommon and defaults by sovereign debtors therefore have a long history.

Not only central governments but also sub-national authorities can sometimes no longer fulfil their obligations. In 1935, the Canadian province of Alberta was not able to service its domestic debt. In 1975, the City of New York lacked the means to collect garbage. The insolvency of Orange County in California in 1994 became famous because of misspeculation with interest rate derivatives. In 2005, the New Orleans City Council was unable to pay employees' wages due to Hurricane Katrina. In recent years, the US states of California and Illinois and Puerto Rico have struggled with financial problems.

Many governments struggle with avoiding structural deficits and limiting rising debt. Political decision-making mechanisms are often unable to effectively prevent (or even favor) such developments. The inevitable limit for deficits and thus for indebtedness is therefore the *sanctioning by the credit and capital markets*. A tense financial situation of countries with deficits and increasing debts increases the default risk for lenders. This default risk must be compensated by the debtor with higher risk premiums on the interest rate. Investors are beginning to sell government bonds. It is becoming increasingly difficult for the government to take on further debt, even if the interest rates are increased. This downward spiral continues until the debtor is *credit rationed* (Reinhart and Rogoff 2008; Blankart 2011a: 361 ff.). At no interest rate, creditors are willing to lend money.

Even if there is no default, it is to be expected that the financial situation of a debtor will be reflected in the spreads of his bonds and that changes in the spreads can be used as an indicator of the risk change in lending. Credit risks materialize as the yield difference (credit risk premium) between a creditor's debt and a risk-free benchmark obligation. Bond spreads thus measure investors' *confidence* in a debtor's ability to meet its obligations (Feld et al. 2017: 320). The analysis of bond spreads can provide insights into the assessment of a borrower by the capital market. As will be shown below, in particular, a federal form of government can serve to keep the public households of sub-national authorities stable and to reduce sub-national bond spreads.

## Fiscal Federalism: A Short Theoretical Framework

Countries may, in principle, be organized as federalist or centralist (unitary) states (Blankart 2011a: 613). These two organizational forms differ in the tasks and resources allocated to each tier of government (so-called fiscal federalism; Hindriks and Myles 2013: 635). A typical measure of a country's fiscal decentralization is the central government's share of total expenditures or revenues.

Many countries have several levels of government to ensure optimal provision and financing of public goods and services. This leads to the following question: Which public tasks and which resources should be assigned to which tier of government *(assignment problem)*? In federal states, the boundaries, the responsibilities, and the resources of the tiers of government are usually defined in the Constitution (Connolly and Munro 1999: 485–505).

The *principle of subsidiarity* usually applies in federal states (Blankart 2011a: 624; Hindriks and Myles 2013: 635). The public tasks and responsibilities are initially assigned to the lowest tier of government (e.g., municipalities). Only if this level is incapable to fulfil a task, it will be transferred to the next higher tier. According to *Oates' decentralization theorem*, federalism and the principle of subsidiarity are most efficient in assigning the various public services and goods to the different tiers of government corresponding to their impact perimeter. If the demands, preferences, and expectations of citizens with regard to the public services vary greatly from region to region, provision at a lower level is more appropriate. The division of responsibilities includes not only the provision of services and goods but also the corresponding resources (e.g., taxes) according to the *principle of fiscal equivalence*. Fiscal equivalence is fulfilled if decision-makers, users, and payers of a political project (provision of public goods and services) coincide (Blankart 2011a: 391, 628; Hindriks and Myles 2013: 636 ff.; Blankart and Ehmke 2019: 19 f.). This congruence strengthens the *accountability* of the political decision-makers *(autonomy model)*. It can be assumed that local and regional authorities with an equivalent fiscal structure will pursue a more sustainable fiscal policy due to their greater self-responsibility. Empirically, greater fiscal autonomy for sub-national authorities usually goes hand in hand with greater budgetary discipline. If fiscal autonomy is decentralized, deficits and debt in the sub-national sector can be reduced.

Furthermore, federal organized states allow for *yardstick competition* between the sub-national (e.g., local, regional) authorities and allow for small-scale experiments and political

innovations. Citizens can judge the performance of "their" government relative to that of other similar governments in the same country. This should lead to a more citizen- and preference-oriented governance and constitute an effective barrier against the government's tax appetite (Blankart 2011a: 615 ff.). In decentrally organized states, the aggregate public budget is lower across all tiers of government than in centralized countries, and simultaneously citizens are more satisfied with public services.

If citizens can compare and choose between different jurisdictions of residence in federal organized countries, this facilitates "voting by feet or exit". Federalism allows citizens to express their preferences not only through votes and elections ("voting by voice") but also through the choice of location (Blankart 2011a: 637 ff.). According to *Tiebout's mobility thesis*, individuals and companies choose their place of residence or location through such fiscal incentives (Hindriks and Myles 2013: 636 ff.).

In summary, the following reasons speak in favor of decentralizing the provision of public tasks and resources in a federal state (Connolly and Munro 1999: 485–505): Different (local, regional) demands are identified by using "on-site" information to provide public goods. The mobility of taxpayers between competing sub-national jurisdictions leads to the efficient use of resources (voting by feet, Tiebout theorem). The yardstick competition leads to a comparability of the performance of competing sub-national jurisdictions. And the sense of local autonomy and community leads to a "small is beautiful" effect.

However, there are also plausible reasons for organizing certain government tasks centrally (Blankart 2011a: 619 ff.; Hindriks and Myles 2013: 636 ff.): Such reasons may be the economies of scale in the provision of public goods and services, the internalization of external effects between sub-national jurisdictions (spillovers), the possibility of social and fiscal redistributions, the minimum provision level of public goods throughout the country, or the coordination of public tasks (e.g., a common legal system). Obviously there is a trade-off between the internalization of spillovers and the use of local information (Connolly and Munro 1999: 485–505). The question of "centralization versus federalism" cannot simply be answered.

In addition to public tasks, resources must be allocated to the federal tiers of government as well (assignment of tax resources) (Connolly and Munro 1999: 485–505): Progressive, redistributive taxes should be levied centrally because work is mobile. Therefore, the central government should mainly tax mobile goods and factors (e.g., earned income). Local governments, on the other hand, should tax immobile goods and factors and raise consumption fees or property taxes. Local governments will then face tax competition to attract mobile goods and factors.

Notwithstanding the advantages of fiscal federalism, there are also financial risks if the principle of fiscal equivalence is not observed. Joint tasks and joint financing represent a common fiscal pool, resources which are often overused. Joint political projects violate the equivalence principle: liability, control, and risk fall apart, possibly leading to moral hazard effects. Fiscal equivalence is not compatible with a mutual guarantee system or a bailout regime within or between states.

If the assignment of tasks and resources (tax revenues) do not match and the fiscal equivalence is violated, transfers between the different tiers of government may be necessary (Connolly and Munro 1999: 485–505). And, as well, if the inequalities between the sub-national tiers of government are considered too extreme, the question of transfers or a federal system of fiscal equalization also arises. Such payments and transfers are fundamentally incompatible with the autonomy model of fiscal equivalence and institutional congruence. When money runs out, the sub-national authority has to limit its expenditure and spend less. Financial equalization from rich to poor jurisdictions with the aim of creating equal living conditions in all sub-national governments would require subsidies and destroy institutional congruence in the autonomy model. Sub-national authorities would rely on fiscal equalization and would reduce their efforts to cover their own costs (Blankart and Ehmke 2019: 19 f.).

In summary, it is therefore to be expected that federal, decentralized countries will be able to better fulfill the preferences of their citizens and that different "endowments" with public goods and services (political design drafts) emerge in the sub-national authorities. It can therefore also be assumed that citizens are more satisfied and thus more willing to pay taxes for these public offers and that an improved financial outcome can be assumed if the fiscal equivalence is met. Accordingly, federal sub-national authorities should rather have to pay lower interest rates on debt than centrally organized states.

## Fiscal Federalism in Switzerland

Switzerland is sometimes seen as a federal curiosity with extraordinary, direct democratic political instruments. Blankart (2011b) developed a theory of Switzerland and explains that the geographical situation of the country with its originally fractured valleys favored the institutional development of Switzerland toward federalism and direct democracy.

Switzerland is an interesting experimental field for federalism research. It consists of 26 different cantons and around 2,200 communes, which are politically predominantly autonomous. The cantons and communes differ considerably in terms of size (area, population), economic power, geology, and geography (Central Plateau, Jura, Alps) and belong to four different linguistic and cultural areas (four official national languages: German, French, Italian, and Romansh). Switzerland is characterized by a biconfessional religious basis of Reformed and Catholic Christians and by political party pluralism. In order not to be torn apart in this diversity as a country, the political decision-making process requires cooperation and coordination in finding solutions. This leads to compromise-ready, concordant, rather slow, and cautious public activities. The historical development of the country has led to evolutionary and pragmatic solutions since the founding of the federal state in 1848.

Switzerland's central political institutions are (Feld et al. 2017: 323) the pronounced federalism with a high degree of political autonomy for the cantons and communes, direct democracy rights at the national and all sub-national levels, and a very large number of regional and local authorities (communes, cantons) by international standards, which make it possible for the citizens to be geographically and mentally "close" to the representative democracy and the governments. This highly decentralized structure, together with direct democratic civil rights, can be seen as an actual "experimental laboratory" for testing various policy drafts.

From a historical point of view, the federal character of Switzerland developed since the end of the thirteenth century into a federal state structure in which the cantons and also the communes play an important role as cooperative structures (cantons as former independent states). The public tasks are to be solved locally in a decentralized manner through the joint efforts of the citizens. In addition to the federal structure, the principle of subsidiarity is a dominant feature in Switzerland.

Switzerland's government tiers consist of the Confederation (central state), the cantons, and the communes, whereby the cantons and communes are largely autonomous in many areas. They are not merely administrative districts but actively shape political life (Article 3, 5a, 43, 47, and 48 of the Swiss Federal Constitution). The Confederation can only exercise those rights which are expressly assigned to it in the Federal Constitution. The cantons are automatically responsible for all other tasks in accordance with the principle of subsidiarity. Switzerland is thus characterized by a high vertical separation of powers.

Public households in federal Switzerland can only be understood in terms of the interaction between the Confederation and the cantons and their communes. The financial history of the Confederation is marked by the historically strong position of the cantons. As a federal state, Switzerland has a low share of expenditure at central government level compared with other industrialized countries (Hindriks and Myles 2013: 94). The cantons are directly responsible for around 40% of all income and expenditure. Although a trend toward centralization was also observed in Switzerland in the twentieth century, sub-national

authorities were better able to retain their autonomy than in many other countries. Blankart (2011b) identifies the pronounced financial autonomy, i.e., that the federal government, the cantons, and the municipalities are responsible for their own public households, as an important factor for this. In a federal state structure, autonomy also requires self-responsibility at all government tiers for tasks and resources. The constitutional project on a reorganization of the division of tasks and the financial equalization scheme between the Confederation and the cantons in Switzerland in the 2000s attempted to come closer to the ideal of fiscal equivalence.

The counterpart to the fiscal autonomy of the cantons and communes is the no-bailout principle, which has been consistently pursued in recent times in Switzerland. In the 1990s, the cantons of Berne, Solothurn, Geneva, Vaud, Appenzell Ausserrhoden, and Glarus experienced considerable financial difficulties as a result of major losses incurred by their cantonal banks (banks owned by the canton). The consistent implementation of the no-bailout principle meant that the Confederation did not grant any financial support and that the cantons themselves had to find a solution . . . and found it (Blankart 2011a: 726). When the municipality of Leukerbad defaulted in 1998, the Federal Court ruled in 2003 that the canton of Valais did not have to bail out (Feld et al. 2017: 323 f.). As a result, the municipality's lenders suffered losses on their loans and bonds.

In Switzerland, too, financial developments in recent decades have been marked by significant growth in government spending. In the 1990s in particular, there were signs of a sharp rise in public debt, which called for measures to be taken. The debt dynamics of the Confederation and the cantons were similar. However, Switzerland has succeeded in restructuring its public households. In the 1990s, for example, the federal government and many cantons successfully introduced debt brakes.

Since the founding of the federal state in 1848, there has not been a single default of the central government or a canton in Switzerland. Defaults at the municipal level were also very rare. In the 1930s, there were various defaults at the municipal level, particularly in the canton of Neuchâtel. Between 1932 and 1935, the canton of Neuchâtel received various federal loans. When, after extensive investments in tourism projects, the debts increased to such an extent that they could no longer be serviced, the municipality of Leukerbad declared insolvency in 1998. This was followed by a restriction in the freedom of action of the municipality with enforced administration in order to initiate the necessary restructuring steps.

Switzerland (as well as the USA) achieves institutional congruence mainly through the *principle of autonomy*. Its local authorities (cantons/federal states and municipalities) finance themselves mainly through taxes and are in charge for their public households. They have far-reaching rights to decide on taxes (or tax rates) and their public tasks and expenditures. In the case of unbearable over-indebtedness, creditors and debtors must find a solution on their own (Blankart and Ehmke 2019: 19 f.).

## Fiscal Federalism: Empirical Impact

From a variety of empirical studies on the impact of federalism on public finances, the overview of Feld and Schaltegger (2017: 59–126) is summarized subsequently. In the international context, the impact of federalism on economic development and growth is not clear and gives a mixed picture. In Switzerland, a positive contribution of federalism is discernible at best. Federalism supports sound public finances and tends to inhibit deficits. Swiss fiscal federalism, too, inhibits debt, but not the deficit. On the other hand, the influence of transfer payments on Switzerland's debt and deficit is not clear. Overall, federalism in Switzerland tends to lead to a reduction in revenues and expenditures and thus to lower government activities. Swiss competitive federalism does not lead to increasing economies of scale. Larger units (e.g., merged municipalities) hardly lead to cost savings. Decentralization generally leads to higher life satisfaction. In Switzerland, it is not only decentralization that is important for life satisfaction but also direct

democracy to a considerable extent. In the international context, the influence of federalism on income distribution in society is unclear. In Switzerland, decentralization and small-scale fragmentation lead to less inequality of income. The decentralization of public activities pushes back corruption in transparent democracies, but not in authoritarian states. There is no evidence for Switzerland. Federalism promotes social capital. In Switzerland, direct democracy and local autonomy also have a positive influence on social capital. Federalism promotes tax honesty and morality and reduces the shadow economy. This also applies to Switzerland, where tax morality is strengthened by direct democracy and local autonomy. Based on these findings, it can be expected that federalism will have a positive effect on the fiscal outcomes of a country and its sub-national authorities and that bond spreads will be lower.

In Switzerland, especially in the cantons, specific fiscal institutions have developed that contribute to sustainable public outcomes (Kirchgässner 2013). On the one hand, direct popular rights, in particular the fiscal referendum, enable citizens to express their fiscal preferences. On the other hand, debt brakes prevent persistent deficits and thus an excessive increase in debt, because public budgets have to be balanced over an economic cycle. The Swiss cantons, especially the financially weak ones, are benefiting from the financial referenda and the debt brakes in order to implement a sustainable fiscal policy. Econometric studies also show that these institutions are successful. They reduce the interest that the cantons have to pay on their debts.

## Capital Raising by the Public Sector and Sovereign Bond Yield Spreads

Various instruments from the capital and credit markets are available to the public sector to cover short-term or long-term financing needs, e.g., the issue of bonds. However, every type of debt has a credit risk. This also applies to government bonds and bonds issued by sub-national authorities. The credit risk of a debtor includes the risk of default (the possibility that a debtor may not be able to pay its interest and amortization) and the time risk (the risk that the promised payments will not be made on time). Sovereign default is the state in which the public sector does not fulfil its financial obligations (interests, repayments) completely or on time.

The sovereign default is fundamentally different from the default of a private debtor. While a private creditor who no longer pays his debts falls into bankruptcy, this is not so easy with public authorities. A certain administrative activity must be continued. A state that is unable to fulfil its obligations is not dissolved. Its existence will not end (Reinhart and Rogoff 2008; Hindriks and Myles 2013: 107). In Switzerland, for example, the "Federal Act on Debt Collection against Communes and Other Cantonal Public Authorities" excludes bankruptcy in the event of the insolvency of municipalities. The law does not apply to the cantons themselves, which is why the situation is unclear for the Swiss cantons. (In the USA, on the other hand, there is an insolvency procedure for public debtors). From a risk perspective, granting loans to the public sector is therefore fundamentally different from granting loans among private individuals.

Four influencing factors determine the spreads between bonds of different countries (Feld et al. 2017: 321; Booth et al. 2007: 1011 ff.): (1) exchange rate risk, (2) credit risk, (3) international risk aversion, and (4) liquidity risk. If a country or sub-national authority is only indebted in its own currency (such as the Swiss central government or the Swiss cantons), the exchange rate risk is irrelevant. International risk aversion plays a major role in explaining spreads, but liquidity and credit risk are also important. In troubled market phases and in crisis situations, investors differentiate more strongly between good and bad debtors. If international risk aversion rises, very safe countries with liquid bonds act as safe havens *(flight to quality)* (Bernoth and Erdogan 2012). In the short term, spreads are mainly explained by global factors (international risk aversion, liquidity), while in the long term, they are dominated by country-specific elements

(public sector fiscal outcomes, macroeconomic environment, political stability).

Assuming the theoretical model of a risk-free investment (e.g., the bond of a solid central government), such bonds do not bear any credit risk. Bonds issued by sub-national local authorities bear a credit risk unless the (risk-free) central government guarantees these obligations (Küttel and Kugler 2002: 208). Sub-national bonds should therefore have a risk premium over central government bonds. The size of this bond spread depends on the individual risk characteristics of the sub-national borrower.

In countries with a federal structure, a significant part of the credit risk of sub-national authorities results from the behavior of the higher state tier. When sub-national jurisdictions experience financial difficulties, creditors ask themselves whether the debtor will be rescued or reorganized. In the case of a sub-national debtor, it may be the central government that assumes or guarantees the obligations *(bailout)*. It is often implicitly expected that the higher level of government will support the lower government tier in financial difficulties (Feld et al. 2017: 321), even if there is no legal obligation to do so. Empirically, it can be shown that the probability of a bailout increases with the size of the local authority. This phenomenon is comparable to the "too big to fail" problem in the financial system. A credible possibility of a bailout that debtors are "rescued" changes the risk arising from lending to sub-national governments. While the risk premium on the debt of a potential bailout recipient decreases as a result of the guarantee, the risk premium on the debt of the central government as explicit or implicit guarantor and payer may increase as a result of the risk transfer (Feld et al. 2017: 321).

Any bailout is a violation of the principle of fiscal equivalence. The idea of a no-bailout regime is that each territorial jurisdiction is responsible for itself (fiscal equivalence fulfilled). This turns the threat of insolvency into an incentive system that activates both creditors and debtors to take precautionary measures (Blankart 2011a; Blankart and Ehmke 2019: 19 f.). The debtor keeps his financials in order because he knows that he will not be rescued. And the creditor monitors the outstanding debt, because he also cannot expect an "external" rescue. Empirical evidence shows that the risk premiums for the guarantor fall (or rise for the guarantee recipient) if a bailout can be credibly ruled out (Feld et al. 2017: 321).

Both fiscal rules and no-bailout clauses can have an impact on refinancing costs and bond spreads. The stricter and more credible the fiscal rules, the lower the risk premiums (Feld et al. 2017: 322). Rescue parachutes and bailouts always cause moral risks: a slackening in the budget discipline of the potentially rescued. Because local governments expect soft budget constraints from a bailout, these are inefficient. They are encouraged to behave strategically and draw from the common pool financial resources at the expense of others (Hindriks and Myles 2013: 650 ff.).

## Sub-national Bond Yield Spreads: A Global Perspective

Studies on government bond spreads (central government) are numerous. However, there is relatively little research to date explaining bond spreads of sub-national jurisdictions (American states, Canadian provinces, German states, Swiss cantons, etc.) (Booth et al. 2007).

Schuknecht, von Hagen and Wolswijk (2009) examined the risk premiums of *German federal states (Bundesländer)*. Before the introduction of the European Monetary Union, the German states benefited from a preferential treatment by the financial markets. Their spreads did not respond to the fiscal situation, especially when they received payments from the fiscal equalization system. This effect has disappeared in recent years. The European Economic and Monetary Union seems to have extended market-based fiscal discipline to the German states. The German sub-national authorities are also paying liquidity premiums.

Bayoumi, Goldstein and Woglom (1995) confirmed for the *US states* that the risk premiums are consistent with the hypothesis of market discipline. Poorer financial ratios lead to higher

spreads. Credit markets appear to provide incentives to limit public borrowing. Risk spreads initially rise only gradually. However, as the debtor's financial situation deteriorates, spreads rise steeply and show a nonlinear development. Unexpected deficits lead to higher interest costs. This effect is lower in states with credible anti-deficit rules.

Booth, Georgopoulos and Hejazi (2007) examined spreads of *Canadian provincial bonds*. Provincial debt and deficits have a significant impact on spreads between provincial bonds and Canadian federal bonds. If a level of debt and deficit in a province is above the provincial average, this leads to nonlinear spread effects. Investors demand higher compensation for a higher default risk, which grows significantly faster at a certain point. During crisis phases, the spreads of provincial bonds react with widening spreads against Canadian government bonds and show "flight to quality" effects.

The past crisis has highlighted the importance of institutional design of bailout clauses. In federal states, these clauses have an impact on the risk premium of sub-national governments bonds. A study for the *USA*, *Canada*, *Australia*, and *Germany* shows that fiscal fundamentals play a role in determining the risk premium of federal states (Sola and Palomba 2016). As expected, higher debt and deficits lead to a higher risk premium. However, this market price mechanism works less well if the central government guarantees debt from lower levels. If a sub-national level is dependent on central government transfers, the influence of fiscal fundamental data on the risk premium is smaller.

In summary, from a global perspective, bond spreads of sub-national governments respond similar as bonds issued by central governments to fiscal fundamentals (such as debt and deficits), market liquidity, and international risk aversion in the capital markets (Schuknecht et al. 2009; Bayoumi et al. 1995; Booth et al. 2007; Beck et al. 2017). Some of the higher spreads can be explained by the lower liquidity of sub-national bonds. The influence of debt and deficits also shows nonlinear effects. As the fiscal situation worsens, risk premiums will rise only slowly for the time being but significantly faster from a certain point. If fiscal rules (such as debt brakes, budget limits) are not observed, spreads react strongly to deficits because they are unexpected. And in times of crisis, spreads widen compared to federal bonds (flight to quality effects).

## Capital Raising by the Public Sector in Switzerland

The Swiss Confederation, cantons, and municipalities use the capital and credit markets to raise capital. Generally, debt is borrowed from the private sector. The Swiss bond market is characterized by a number of interesting facts. The high domestic savings rate (e.g., compulsory savings via pension funds) leads to a permanent need for investment, which is met by a relatively small investment market. At around 115% of GDP, the bond market is about the average size for a developed economy. The overall low level of public debt in Switzerland at all three federal tiers leads to a limited market. For example, the proportion of bonds issued by the Swiss Confederation has declined steadily in the last years as a result of falling capital requirements. The overall good financial situation has also enabled the cantons in recent years to repay bonds on average.

Not all cantons issue bonds at all. In some cantons, either the capital requirement is too low to place a bond or the costs of a capital market issue are too high for small cantons in relation to the financing volume. They therefore use other financing channels like the credit market. The empirically observable considerable differences between the yield spreads of the individual cantons in the secondary market are probably less due to credit quality than to the low volume and instrument-specific factors.

Since 1990, only 19 out of 26 cantons have issued bonds. Seven cantons have never raised money through bonds (AI, GL, NW, OW, SH, UR, ZG). Only 12 cantons have outstanding bonds in all years (AG, BE, BL, BS, GE, LU, NE, SG, SO, TI, VD, ZH). A large proportion of the bond volume is attributable to five urban cantons with large cities (BE, BS, GE, VD, ZH).

These cantons issue bonds on a regular basis. Since the 1990s, cantons and cities with central location burdens have been under financial pressure and have corresponding financing needs. These cantons clearly dominate the market. These bonds are considered liquid.

From the investor's point of view, the issue volume is particularly important. Modest volumes with only sporadic issuing activity lead to low market liquidity, which can lead to price distortions. Investors prefer high volumes and liquid markets. For less liquid securities, investors demand a liquidity premium. Liquidity and thus any spread are reflected in transaction costs on the one hand and in tradable volume on the other (Booth et al. 2007). It is therefore to be expected that more liquid securities will have lower spreads (Feld et al. 2017: 321, 326). In the case of financing via the capital market of sub-national authorities in Switzerland, a market failure may also be discernible due to an inefficient pricing process. This is indicated by the illiquidity of the market, information hurdles, and information costs. Overall, only relatively few sub-national authorities benefit from easier market access to the bond market in terms of regularity and issue volume.

With regard to *illiquidity*, there is market segmentation through buy-and-hold strategies of institutional investors (e.g., pension funds) on the one hand, and on the other hand, the issue volume is often quite low, which hampers continuous trading. Some bonds are not traded daily. Both lead to liquidity premiums. Interest payments are also subject to a withholding tax.

With regard to *information barriers*, there is uncertainty as to whether there is an implicit government guarantee of the higher federal tier in the event of payment defaults. In addition, it is legally and politically difficult to determine in which cases government liability applies in the event of a default (bailout). This uncertainty about the legal situation is an information problem. How the market reacts depends on the credibility of the bailout regime.

With regard to investors' *information costs*, it should be borne in mind that private and public accounting differ significantly. An investor in private corporate bonds cannot easily transfer his analytical knowledge of the debtor's financial situation to public sector bonds. Ratings could increase transparency in a market (Blankart 2011a). The different financial situations of the cantons should influence the rating. However, only a few cantons have their bonds rated by an international rating agency.

The actual default risks of the Swiss cantons may be very low, tend toward zero, and differ only slightly between the individual debtors. In such a case, the spreads could be so small that they could no longer be measured correctly. The nonlinear effects described by Booth, Georgopoulos, and Hejazi (2007: 1027 ff.) as well as by Bayoumi, Goldstein and Woglom (1995) can also be used to draw conclusions about such a finding. The spreads only react visibly to (rare) extreme situations. This could also be the case for the Swiss cantons. As already mentioned, there has never been a default of a Swiss canton before. At least at the municipal level, however, differentiations could be observed after the Leukerbad case. From an analytical point of view, it could be problematic that the Swiss cantons are all "good" debtors and show too little variance in default risks.

## Sub-national Bond Yield Spreads in Switzerland: Empirical Findings

The Swiss cantons issue their bonds only in Swiss francs and not in foreign currencies. They are part of the Swiss Franc Monetary Union, which includes, for example, the Principality of Liechtenstein, which uses the Swiss franc as its currency. Because the Swiss National Bank implements monetary policy as an independent central bank (Article 99(2) of the Federal Constitution of Switzerland), the federal tiers of government in Switzerland (central government, cantons, and municipalities) cannot control the monetary policy and reduce debt through inflation.

For bonds issued by Swiss cantons, it can be assumed that in addition to the liquidity of the bonds and the international risk aversion of the investors, the default risk in particular influences

the spreads. In Switzerland, it can be assumed that the financial autonomy of the cantons and municipalities is credibly linked to a no-bailout regime, and so the default risk is determined by the fiscal performance (tax potential) of a canton. The sustainability of the debt burden through interest and amortization is therefore determined by the economic performance.

In the early 1990s, there was empirical evidence that cantonal deficits and debts as well as cantonal financial strength significantly influenced the spreads of cantonal bonds. Fiscal rules also lower bond prices. Decentralized cantons with a high degree of communal autonomy are characterized by lower capital costs than centralized ones. More intense tax competition also appears to reduce interest costs.

Küttel and Kugler (2002) examined yield differences between cantonal bonds and Swiss federal bonds (*Eidgenossen*) from 1990 to 1998. The central driver of cantonal bond spreads is international risk aversion in the capital markets. The results show that cantonal fiscal indicators (debt, deficit, tax revenue) have no statistically significant impact on spreads. In contrast, institutional factors (financial referendum, direct democracy, language) are important. Cantons with stronger institutional barriers to new spending (e.g., fiscal referenda) have significantly lower spreads. Cantons in Latin Switzerland and cantons with large cities pay higher interest rates on their debts. In the case of cantonal bonds, the Russian and Southeast Asian crises from August 1998 have shown "flight to quality" effects. Spreads have risen by 50 basis points compared with the Swiss government bonds. As already seen, investors differentiate more strongly between good and bad debtors in turbulent market phases.

Feld et al. (2017: 335 f.) show that the existence and credible strength of fiscal rules reduce spreads. The federal court's 2003 decision in connection with the default of the municipality of Leukerbad that cantons are not liable for financial difficulties of their municipalities led to a credible no-bailout regime in Switzerland for communes. The risk premiums of the guarantors (cantons) fell by around 25 basis points. The markets assumed that the cantons would in fact not have to take responsibility for their municipalities.

A recent paper examines how fiscal federalism in Switzerland affects cantonal bond spreads from 2000 to 2016 (Hofmann 2020). The Swiss cantons pay an average positive spread of 20 basis points over the Swiss Confederation. Not a single canton has a negative spread on average between 2000 and 2016. However, negative spreads do emerge for individual cantons in individual years. There are 28 annual negative spreads from various cantons, mainly concentrated in the years 2003 to 2005 and 2009 to 2011 (lowest value: canton Appenzell Ausserrhoden in year 2003, −33 basis points). During the peak of the financial crisis, between 2008 and 2009, the spreads of the individual cantons fell significantly. The crisis did not affect all cantonal bonds to the same extent. Overall, it can be seen that international risk aversion, bond liquidity, and cantonal credit quality have a significant impact on bond spreads. And a lower dependence on fiscal transfer payments reduces cantonal bond spreads.

The creditworthiness and the default risk of Swiss municipalities (the third federal tier) have almost no influence on the risk premiums to be paid. Even the confirmation of the Swiss no-bailout policy by the Federal Court in 2003 did not increase the spreads on municipal debt (Sigrist et al. 2018).

A comparison of Switzerland with other federal countries (Australia, Canada, Germany, the USA) shows (Hofmann 2020; Sola and Palomba 2016: 167–169) that sub-national governments in federal states usually have to pay positive spreads on their bonds. This is because they have lower economic performance, lower tax capacity, and therefore a higher risk of default. However, the greater the fiscal autonomy (as for the cantons in Switzerland), the less this must be the case. Negative spreads are therefore quite possible and can also occur (e.g., in the USA) if sub-national bonds benefit from tax privileges over central government bonds. However, this is not the case

in Switzerland either. Interest payments from bonds are taxed equally. In Switzerland, the no-bailout principle is strictly enforced between the federal levels of government (similar to the USA but different from Germany). This fiscal autonomy means that Swiss cantonal bonds can have lower default risks than bonds issued by the central government. Lower liquidity and the generally low volume of cantonal bonds generally lead to higher spreads. Overall, the results show that the cantonal bonds are integrated into the international capital market and that the spreads react to the usual factors. However, they also react to a certain extent to fiscal federalism in Switzerland.

## Conclusion: Fiscal Federalism and Sub-national Bond Yield Spreads in Switzerland

Empirical studies show that fiscal federalism often has a positive impact on public finances. Debt and deficits of governments are lower. Whether this also leads to lower spreads on sub-national bonds is less clear. Empirical evidence on fiscal federalism in Switzerland shows that certain aspects narrow the spreads on cantonal bonds (Hofmann 2020).

Basically, the spreads of Swiss cantonal bonds react similarly to the spreads of sub-national bonds in other countries. Rising international risk aversion, lower liquidity, and lower credit quality in the form of higher gross debt lead to rising spreads. However, this is not the case for cantonal public deficits, which are not significant. And from 2008, cantonal gross debt is also no longer significant. Thus, the latest studies differ from older studies that describe the influence of the canton's fiscal situation on bond spreads (Feld et al. 2017; Küttel and Kugler 2002).

If the fiscal federalism in Switzerland is examined, the *transfer payments* to the canton have an influence on the spreads (Hofmann 2020). The higher the share of transfer revenues in the public budget, the higher the spreads of a canton. A fiscal dependence on transfer payments worsens the position of a canton on the capital market. Decentralized fiscal responsibility has a positive influence on spreads in the Swiss context. Before the financial crisis, between 2000 and 2007, the *decentralization of revenues* also showed a significant result. The higher the revenue decentralization, the lower the spreads. However, this effect disappears with the outbreak of the crisis.

How are these empirical results to be interpreted? Bonds issued by Swiss cantons are not completely immune to developments on the international capital market. That global risk aversion, bond liquidity, and cantonal debt affect spreads is in line with theory and literature. Direct democracy, federalism, and fiscal autonomy can positively influence the financial outcomes of the public sector, and the political and institutional framework in a country can be relevant for bond spreads. Between 2000 and 2016, spreads on cantonal bonds versus central government bonds are usually quite low and mostly positive. However, negative spreads occur in some years for some cantons (Hofmann 2020), which is unusual by international standards. This is possible because the Swiss Constitution provides an extensive fiscal autonomy for the cantons and because a bailout by the higher tier of government can be credibly ruled out. A canton can therefore have a lower default risk on debt than the confederation. Interesting in the Swiss context is that a lower dependency on transfer payments shrinks cantonal bond spreads. However, this effect is muted by the inclusion of Switzerland in the international financial markets.

What could limit the findings for Switzerland and make an international comparison more difficult? The public debt of the Swiss cantons is very low overall. It may not even be possible to determine the default risk from bonds. For fiscal values to have an impact on spreads, they must exceed a certain threshold. Since not a single canton has failed since the founding of the federal state in 1848, the effect of excessive debt and deficits cannot be investigated either. If you are dealing with public bonds in Switzerland, you usually find yourself in an almost zero-risk world.

# Fiscal Federalism in the USA

Julius A. Nukpezah and Aisha S. Ahmadu
Department of Political Science and Public Administration, Mississippi State University, Starkville, MS, USA

## Synonyms

Intergovernmental fiscal relations; Multilevel government finance

## Definition

Fiscal federalism concerns the hierarchical decentralization of governmental fiscal functions, authority, and relations between a national government and subordinate governments (Ostrom et al. 1961; Riker 1964). It is the financial

interaction between the different levels of government in a federal system that is characterized by multilevel governments, which addresses the need for equitable distribution of income, maintenance of high employment with stable prices, and establishment of an efficient pattern of resource allocation. Fiscal federalism also deals with understanding the functions and instruments that are best centralized and those that are best decentralized by assigning different roles to different levels of government and providing the needed instruments to perform these functions. In the USA, the levels of government in the federal arrangement are the federal, state, and local governments.

## Introduction

Fiscal federalism – a term attributed to Richard Musgrave – is a subfield of public finance that functions as an institutionalized bureaucracy characterized by centralized planning, efficient assignment of functions, and intimate cooperation between the different levels of government. The concept is deeply embedded in the fabrics of American society to optimally deal with certain problems or service activities at the national or subnational level. The relationship shared by the federal, state, and local governments not only is a political or a defense pact but extends to an economic and fiscal relationship that distributes resources equitably among the sovereign states recognizing that some members of the union are more endowed than others. Fiscal federalism assigns the central government the responsibility for macroeconomic stabilization and income redistribution, whereas the decentralized governments provide goods and services whose consumption is limited to their jurisdiction (Oates 1999).

The US federal arrangement started with 13 independent states in 1789, which continued to expand with the admission of new states into the union. Alaska and Hawaii became the 49th and 50th states, respectively, to join the federal republic of the USA in 1959. Over more than two centuries of its existence, American federalism has become, perhaps, the most important political force the world has seen. With its military and political might that is fueled by the fiscal cooperation of the sovereigns in the union, the USA is able to address many of the challenges it faces both domestically and internationally making it a global superpower. The fiscal relationship among the sovereign governments in the federation keeps changing, and these paradigm shifts bring new challenges to the fore.

The present entry examines American federalism with a focus on the fiscal relationship existing between sovereign governments. It discusses the evolution of federalism and the fiscal instruments used when the paradigm shifts. The chapter also discusses benefits and challenges of fiscal federalism as well as how it has been studied by scholars. The chapter concludes with a discussion of the future of fiscal federalism in the USA.

## The US Federal Structure

The federal structure of the USA is made up of the federal government and the 50 sovereign states. Although territories such as Porto Rico, Guam, and the American Virgin Islands are part of the USA, these are considered territories and come under American protectorate. The constitution of the USA stipulates powers that are granted to the federal government and indicates that all other powers are reserved to the states including authority over local governments within their boundaries. The formal powers, roles, fiscal instruments used by multilevel governments, and relationships underlying American federalism have evolved over the years and include:

- *State-Centered Federalism*

  In the early part of the union under the Articles of Confederation, state-centered federalism (1787–1865) saw the states wielding more influence and power over national policies. Proponents of state-centered federalism including Thomas Jefferson and members of the Republican Party advocated for independent state governance and sovereignty in structuring the political life of residents residing

within their jurisdictions. State-centered federalism articulated state rights and left the central government incapacitated with limited enumerated and fiscal powers to raise taxes to fund government operations.

- *Dual Federalism*

  After the American Civil War in 1865, the country was ushered into a new era in American politics. Dual federalism (1865–1913) created a distinct and separate sphere of political influence for federal and state governments. Both the federal and state governments maintained exclusive authority over distinct delineated spheres of influence. The central government refrained from interfering in the domestic affairs of states. Political science scholars compared this era to a cake with clearly defined layers representing the different levels of governments, its ascribed powers and responsibilities, hence the term layer cake federalism. For instance, the state governments maintained the responsibility for providing public safety, education, and social welfare needs, whereas the national government provided national security and regulated interstate commerce. Federal revenue sources for public policies ascribed by dual federalism were mainly from custom duties and excise taxes that it levies on citizens, while the states derive revenues from property tax on wealth.

  The major problem inherent in dual federalism is the constant overlap in federal and state jurisdictional responsibilities because the constitution does not explicitly define such power boundaries. Although the Tenth Amendment delegates all powers not expressly stated in the constitution to states, Article 1, Section 8, gives the US Congress the powers to make legislation that are necessary for proper functioning of the country. The Supreme Court has resolved several conflicts emanating from disagreements in the proper authority and jurisdiction of the federal and state governments.

- *Cooperative Federalism*

  With the passage of the federal income tax in 1913, the federal government became more dominant because of the wealth from its power to tax all citizens, which led to a radical expansion of Washington's intergovernmental power. The Great Depression in the 1930s required the federal government to intervene in state and local affairs to address social welfare challenges at the subnational level. Hence, under President Roosevelt's new deal program, the national government took over the responsibility of protecting the general welfare of citizens through programs such as Social Security Administration. Both the national and state governments jointly funded social welfare and policy programs to tackle the poverty ravaging society. While the federal government derived most of its revenues from income taxes on individuals and corporations, the states and local governments derived their revenues from sales and property tax, respectively.

- *Centralized Federalism*

  The 1960s introduced the era of centralized federalism (1964–1980) also known as creative federalism, which essentially gave the federal government the preeminence in making policies, and the states implemented these actions utilizing grants-in-aid or intergovernmental transfers. This form of federalism was coined by President LB Johnson and attempts for all levels of government to jointly partake in the management of intergovernmental programs. To receive funding for policy programs from the central government, states are forced to adopt federally determined objectives. From 1964 upward, social security provided important revenue for the federal government for the implementation of social and welfare programs.

- *New Federalism*

  New federalism (1980–1985) emerged in the late twentieth century. President Nixon and Ronald Reagan are credited for popularizing the term "new federalism" as an effort to return autonomy and preeminence in policy areas to the states while maintaining significant level of federal funding. The president imposed new policy objectives on intergovernmental arrangements. Initially, states could only use intergovernmental funds for specific federally approved objectives.

However, President Reagan introduced the "block grant" program, which allowed states and local governments greater discretion in the use of federal funds. New federalism presumes that decentralizing fiscal power to states enhances efficiency in administrative spending and improves policy implementation outcomes.

- *Coercive Federalism*

  Coercive federalism (1985–1995) focuses on federal-state relationships in policymaking. The powers of the central government were substantially enhanced to override state policies and impose federal objectives and mandates. One of the most significant characteristics of coercive federalism is the fiscal constraints and limited discretion the federal government imposes on subnational governments. For decades statutory and federal laws prohibited state taxation on Internet sales. However, in 2018, the US Supreme Court granted states the right to require and collect taxes from online retailers. Furthermore, the Bipartisan Budget Act (BBA) passed in 2018 obliterated spending limitations, thereby increasing the number of congressional earmarks for government programs compared to previous decades.
- *Manna from Heaven Federalism*

  The federalism practiced by President Obama especially during the recession years in 2009 to the end of his presidency in 2016 was the "the angel food cake: Manna from heaven federalism," where the federal government invests heavily in the states and local governments to save them from regulatory and bureaucratic impediments (Henry 2013). The 2007–2009 Great Recession required the Obama administration to introduce a $787 billion stimulus package as countercyclical measure to recover the economy of the USA.

## Benefits of Fiscal Federalism

Fiscal federalism presents governments with several benefits, which include the following:

- *Efficiency in resource allocation to various segments of the nation*

  Fiscal federalism is efficient and cost-effective in allocating resources and delivering public services across jurisdictions. Governments can tailor goods and services to the preferences of the local populations. More specifically, decentralized provision of public services likely weakens the spillover effects, ensuring that the resources allocated are received by citizens who are in dire need of it. Furthermore, fiscal federalism empowers each level of government with a taxing authority to levy the local population for the purposes of meeting their preferential needs. For example, property tax is levied at the local level because at this level the benefits of such taxes are more tangible and observable by citizens who pay them (Nukpezah 2019).
- *Increased participation in policy and governing processes*

  Fiscal federalism impacts both the economic and political domain of a nation. Citizens relish the political benefits of fiscal federalism when the democratic institutions inherent in the nation effectively utilize financial instruments to address core economic and social issues. For example, during traumatic events at subnational level, resources available at the higher-level governments are made available to locals where they can more effectively respond to crises (Nukpezah 2017).
- *Lower cost of government operations*

  By identifying those activities that need to be centralized in national governments and those that should be decentralized at the various levels of subnational governments, control of fiscal responsibilities and decision-making that help governments to minimize the cost of operation is realized. Recurring costs within jurisdictions which have been previously identified to meet the needs of the local population can be internalized. The internalization of the costs relating to public service distribution within jurisdictions also assists in increasing accountability and provides a framework for continuous adjustments to devise more avenues to meet public needs efficiently.

- *Local and regional economic differences are accounted for by intergovernmental transfers*

  Fiscal federalism pools public resources together and disseminates it in the form of intergovernmental transfers and grants to subnational governments. The economic stability and efficiency in federal resource allocation to states and local government is attributed to fiscal federalism (Musgrave et al. 1989). Federal grants to state and local governments totaled $474 billion in 2017 alone. During the same period, states transferred about $500 billion to fund local government activities. State funding is a combination of federal grants and revenues raised by the states through taxation and fees.
- *Competition among localities encourages innovations both politically and economically*

  Fiscal federalism affords localities with the opportunity to diversify local outputs. Structural variations and funding innovations of key grant outlays such as education, health, housing, and infrastructure make some jurisdictions more competitive than others. The Tiebout model shows that citizens will "vote with their feet" and make choices based on their satisfaction with the taxing requirement and efficiency of service delivery of jurisdictions. The ensuing competition leads to better tax-service packages.

## Demerits and Challenges of Fiscal Federalism

There are several impediments faced by democratic countries in the implementation of decentralization. For the USA, possible challenges envisaged include:

- *Lack of Fiscal Autonomy*

  Overreliance on federal grants limits the independence of many subnational governments from the control of a predatory central government (Weingast 2014). Although predatory behavior is commonly evident in developing countries where the national government undermines the performance of jurisdictions by inadequately funding their mandates, variants are possible in the USA. In the USA, the federal government has more fiscal resources than subnational governments, which perpetuates continuous dependence. Fiscal autonomy in terms of raising own revenues to sufficiently cater to state welfare needs is critical because it extricates local governments from the manipulative helms of the central governments. Granting lower governments the independence to tax their jurisdiction and diminish the use of transfer funds eliminates manipulation and control of lower-level governments.
- *Insecure Governments*

  Democracy imbues citizens with the right to enjoy the provision of certain public goods by virtue of their citizenship; however, insecure governments can perniciously use elections to socially control citizen behaviors and voting preferences rather than promote public welfare. Evidence suggests that districts who opposed the central government faced the dilemma of grant withdrawals (Rodriguz 1995). The national government can design policies that discriminate against certain segment of the population. The larger the discretionary resources available to the central government, the more power it possesses to socially manipulate the behaviors of citizens.
- *Fiscal Imbalances*

  An endogenous problem inherent in fiscal federalism is the disparity in power to raise revenues for public expenditures. Literature highlights two forms of tax imbalance: vertical and horizontal imbalances (Oates 1999; Weingast 2009). Vertical imbalance occurs due to disparities in the taxing structure of national and regional governments. The central government maintains a well-structured system of taxation that is uniform and comparatively cheap to administer. The superior tax structure imbues the central government with the ability to raise more taxes for intergovernmental transfers. On the other hand, horizontal fiscal imbalances arise when differences in regional economies directly affect the tax income generated (Weingast 2009). Technically, horizontal inequalities affect the fiscal ability of the locality to provide public services to citizens. Therefore, equalization payments

from the national government are required for distribution to struggling localities. More emphasis is placed on vertical imbalances due to inadequacies inherent in the taxing systems of lower-level governments especially in developing countries. Subnational governments continue to encounter challenges in the effective use of their tax base to raise revenues that equal their debt obligations (Oates 2006).

- *Accountability Issues*

  Overreliance on federal grants has the tendency of making regional governments less accountable to voters and uncreative in public sector operations (Bahl and Linn 1992). Public officials contribute to the dilemma by serving to implement their own interests, which expands the budget (Musgrave et al. 1989). The federal funds are used in maximizing the size of the bureau or increase salaries rather than cater to the needs of citizens. However, in recent years, the financial role played by the central government in financing the activities of state and local governments continues to diminish, thereby assigning those responsibilities to lower governments. Federal aid to states has, however, been dwindling since the 1980s. Devolution of fiscal responsibilities to lower levels of government for the provision of public goods and services has increasingly caused regional governments to experience revenue shortfalls and thereby exercise discretion in maintaining balanced budgets and curtailing expenditures (Bae et al. 2012).

## Federalism and Revenue Sources

The federal government obtains revenues to finance its public policy decisions primarily through income taxes. In 2018, for example, total federal revenue received was more than $3.3 trillion, which is about 16.5% of GDP. Sources of federal revenues include individual income, payroll, corporate, excise, estate, and gift taxes. The total amount of revenues received each year by the federal government increases as the economy flourishes.

Before 1913, the primary source of government revenue for the federal government was tariffs, excise taxes, and fees obtained from the sale of frontier lands. After 1913, however, the federal government raised revenue through the individual and corporate income tax as well as social security and excise taxes. Individual income taxes accounted for the largest (51%) source of federal government revenues in 2018. This encompasses taxes collected from the wages and salaries earned by individuals, income from investments, and other forms of income. Payroll taxes, also known as social insurance taxes, are the second largest component of federal revenues (constituted 35% of federal revenues) and are used to fund Social Security, Medicare, and unemployment insurance. In 2018, most corporate income was taxed at 21% at the federal level and constituted 6% of federal revenues. Excise taxes that are levied on goods such as tobacco, alcohol, and motor fuels contributed about 3% to federal revenues. Estate and gift taxes contributed just a small portion of federal revenues. In 2018, only estates over $11.18 million were subject to federal taxes.

In the early part of US history, property tax is the paramount financial instrument used by the state governments. However, with the adoption of sales tax, the use of property tax was delegated to local governments because it is more efficient to collect at that level due to less bureaucratic bottlenecks (Nukpezah 2019). While property tax contributed less than 2% of state revenues in 2016, it accounted for more than 40% of the $1.4 trillion local government revenues for that year. The main sources of state revenues include sales tax, which contributed 30% of states' $1.6 trillion dollar revenues. General sales tax is not collected at the federal level although local options are available in some states.

States that contribute the highest revenues to the federal government include California ($227,530,971), New York ($133,256,731), and Texas ($117,748,038). Other major contributors are Florida, Illinois, New Jersey, Pennsylvania, and Massachusetts. On the other hand, states that contribute less to the federal purse include Vermont ($2,507,137), Wyoming ($2,862,573), and Alaska ($3,479,163), partly because of their smaller population. The more populous states tend to contribute more to the federal purse. For example, California alone makes more federal

contributions than the 25 lowest-paying states combined. The top ten states contribute almost 60% of all federal tax revenues. While economic activities are more vibrant in the top 20 states, they also enjoy larger populations. States with high income levels usually have higher tax burdens, sometimes above national average. In the USA, an average adult pays $5,512 in federal taxes. However, residents in the ten highest paying states contribute at least $1,282 higher than the national average. The top four states contribute the bulk in federal contributions even though only 11.8% of the US population resides in those states.

The major receivers of federal aids are states with exceptional high rates of poverty, which include Mississippi, Alabama, Louisiana, New Mexico, and Maine. Large disbursements are funneled to these states to finance safety net programs such as Medicare, Medicaid, SNAP, and Social Security. About 40 states receive more federal aids than the contribution they make to the national purse. The ten states that contribute more to the federal purse but receive less funding include Connecticut, Massachusetts, New Jersey, New York, North Dakota, Illinois, New Hampshire, Washington State, Nebraska, and Colorado.

## First and Second Generation of Fiscal Federalism

Oates (2005) groups the study of fiscal federalism along the lines of first- and second-generation theories of fiscal federalism and asserts that first-generation theories sought to correct various forms of market failures, promote equitable distribution of incomes, and stabilize the macroeconomy at high levels of unemployment and suggests that each level of government seeks to maximize the social welfare of their respective constituencies.

*First-generation theories (FGT)* are also concerned with understanding the performance of the federal government at redistributing resources to subnational governments and how public taxation is utilized to promote economic development and stability at the national level. The underlying efforts to design suitable schemes for redistributing income and public services from central to regional governments are to achieve efficiency. More specifically, the focus is to solve the problem of vertical imbalances inherent in intergovernmental transfers and the decentralization of expenditure.

First-generation theories are largely normative and assume that public decision-makers are benevolent maximizers of social welfare (Weingast 2007). The centralization of revenue responsibilities ensures that the consumption of resources is uniformly achieved across jurisdictions. However, decentralizing the provision of public services and goods helps jurisdictions to internalize benefits and weigh the costs of programs (Oates 1972; Tiebout 1956). Local outputs are more efficiently tailored to meet the demands of residents in each jurisdiction compared to centralized activities. Maximizing social welfare at varying degrees across jurisdictions on grounds of efficiency can be performed adequately by the lowest level of government due to its proximity to residents and discernment of cost conditions and preferences.

*Second-generation theory (SGT)* of fiscal federalism draws from the theories of public choice and political economy to study fiscal federalism. SGT builds on FGT and focuses on equalizing the redistribution of resources across regions while taking into consideration the political interests of public officials to foster the growth of subregional economies. The underlying assumption of SGT is that public officials have goals induced by political institutions that often diverge from maximizing citizen welfare (Weingast 2007). Thus, the SGT takes into consideration both the objectives of public officials and residents in maximizing resources to derive incentives.

Second-generation theories also support market-preserving federalism, a special type of federalism that limits the degree to which a country's political system can encroach upon its markets. Extant scholarship on market-preserving federalism suggests that the stability of a federal structure hinges on the mutual interaction of political and economic mechanisms (Oates 2006; Weingast 1995). Since political structures and rule of law play a significant role in sustaining or deterring economic growth in a federal system, an assumption of market-preserving federalism is the consent from the national government to refrain from interfering in the delegated

authority of lower governments in order to maintain continued support.

Market-preserving federalism is sustained by regulating the economic powers of lower governments in monopolizing the mobility of public resources. The elimination of rent-seeking behaviors and creation of monopolies by lower governments impede corruption. Extensive corruption is prone to occur when governments are granted special privileges to create monopolies or give preferential treatment to certain interest groups particularly in developing nations (Weingast 2009). Curtailing the regulatory and monopolistic powers of lower governments provides an equal opportunity for regional governments to compete in a regulated environment. Public choice phenomena grant consumer taxpayers (based on their ability to pay) the power to choose the best among jurisdictions employing economic variations in the provision of social amenities.

On the fiscal side of market-preserving federalism, discreet macroeconomic policies are utilized by the central government to maintain economic stability and formulate effective techniques for public resource redistribution (Ostrom et al. 1961). Self-enforcing principles such as formal budget constraints are used in regulating the fiscal behaviors and demands of lower-level governments.

## Conclusion

Fiscal federalism provides an economic framework that allows federal, state, and local governments to interact in the distribution of resources among various levels of governments for the benefit of their people. Federal aids disbursed to subnational governments continue to increase in scope to fund government programs and agencies. For example, one estimate suggests federal aid spending in 2018 was $697 billion to fund 1,386 agency programs. Compared to when the American federalism started in the 1780s, the amount of aids received by states and local governments in the twenty-first century has grown steadily since President Johnson's administration making citizens to perceive the strength of the federation. Concerns about the large federal budget and deficit have caused some governments to cut some programs. However, as some programs are cut, new ones are created, which makes it a zero-sum game. The federal budget continues to grow.

All states benefit one way or the other fiscally from the American fiscal federalism. As discussed in this chapter entry, the American federalism has evolved over the last two centuries of its existence. The adoption of various fiscal instruments such as federal income tax, state sales tax, and local property tax has influenced what source of revenue each level utilizes within the federal arrangement. Also, various presidents and their ideologies regarding whether federalism should be state-led or federal government-led has shaped the federal relationship. One thing is certain. The American federalism will continue to evolve, but it will continue to combine the strengths of having a national sovereign and decentralized subnational governments that represent the interests of their citizens and provide benefits to all residents.

# Fiscal Impact of Secession on Spain and Catalonia

Malcolm K. Oliver
Master of Public Policy and Administration Program California Lutheran University, Thousand Oaks, CA, USA

## Definitions

Secession – The action of withdrawing formally from membership of a federation or body, especially a political state.

Sovereign Debt – The amount of money that a country's government has borrowed, typically issued as bonds denominated in a reserve currency.

## Introduction

This entry provides an analysis of the potential fiscal impacts of a Catalonian secession from Spain. Through a review of the economic fundamentals of the Spanish economy and economic policies, the Spanish economy would be negatively impacted by the secession of Catalonia. In the long run, the Spanish economy displays enough resilience to recover from this shock and would remain an investment grade sovereign. However, the case of a sovereign Catalonia is different. Secession from Spain would require this young sovereign to address severe fiscal challenges from its inception, which makes the secession of Catalonia from Spain a very costly and highly unlikely event. This entry explores the challenges posed by Catalonia's attempt at secession from Spain by assessing the legalities, foreseeable economic impacts, and the uncertainties that would arise.

The impact of Catalonia's bid for secession upon Spanish economic performance is noteworthy, because this recovery is considered a model for other countries in the Eurozone. This story also demonstrates the volatility of economic recovery in what can be classified as one of the most economically developed, democratic, and politically stable nations. Although the Catalonia separatist issue has been around for some time, the movement has only recently been viewed as a serious threat to Spanish sovereignty, and more broadly, to the economic interest of Spain. This issue is being closely watched around the world, because of the implications this will have for the international community, business interest, and the holders of Spanish sovereign debt, which currently stands at $1.344 trillion (Bank for International Settlements [BIS] 2017). In instances where political activity is impacting economic growth, the world typically turns towards the international

credit rating agencies to provide insight on how this activity will impact the fiscal strength of a sovereign and its ability to meet its debt obligations.

Assessments which analyze the impact of political events on economic performance are typically carried out by the primary sovereign debt rating agencies, Standard & Poor's (S&P), Moody's Investor Services (Moody's), and Fitch Ratings (Fitch). This practice was developed to guard against sovereign debt risk. The value of these ratings is that they provide an easy to understand grading system which substantiates the grade based upon a clear and direct analytical report that assesses the perceived strength or weakness of the debt being offered. These reports include an analysis of the following characteristics of a sovereign: (1) political stability, (2) economic structure and growth prospects, (3) fiscal flexibility to manage debt, (4) monetary stability, and (5) external flexibility to raise additional funds to cover the debt if necessary (Bhatia 2002). These reports are then utilized by investors to judge the risk posed by purchasing debt.

In 2016, the international sovereign bond market was valued at approximately $57 trillion (BIS 2017), which equates to the combined GDP of the 16 largest economies in the world. Sovereign debt accounts for 36% of all global credit provided to the nonfinancial sector (BIS 2017), which makes this a vital component of the global financial system. On average, the return on sovereign debt bonds is typically less than that of corporate bonds. The default rates for 10-year issues of sovereign debt averaged 1.7% for investment grade and 18.3% for speculative grade debt issued between 1983 and 2016 (Moody's Investor Services [MIS] 2017a). For corporate issuers during this same time, investment grade defaults were 2.3%, while speculative grade defaults stood at 30.6% (MIS 2017a). In the unlikely event that a sovereign does default on a bond, the recovery rate between 1985 and 2016 has averaged 54%, compared with the corporate unsecured bond recovery rate of 37% during this same period (MIS 2017a). The sovereign bond market provides increased stability and predictability for investors, which has led to the growth of this sector.

There are large differences in the composition of the investor base of sovereign debt. Andritzky (2012) has assessed this composition and has found that the investor base within a sovereign reflects a regional or country specific pattern. For example, in the United States, Canada, and the United Kingdom, which have highly developed financial systems, the investor base is diversified. In the Euro Zone, a large share of the sovereign debt holders are international (52.1%), in contrast to Japan (29%) and South Korea (14.9%), where most of the bondholders are from those respective nations (Andritzky 2012).

One of the most comprehensive studies completed to-date on sovereign debt default was completed by The Bank of Canada in 2015. This research found that out of 213 sovereigns, 78 (32%) were in default as of 2014, with a combined debt in default total of $129 billion, which accounts for 0.2% of all sovereign debt (Bank of Canada [BOC] 2015). Most of the sovereign loans in default were made by development agencies and national export creditors, which are classified as *official creditors* (69), and secondly, *private creditors* (41), which is composed of foreign commercial creditors, bondholders, banks, and suppliers (BOC 2015). Sovereign defaults are heavily concentrated in low- to middle-income countries, with Greece being the first high income country to default on a loan in 2012, and then Ireland (2013), Cyprus (2013), and Portugal (2013); however, these European sovereign balances have since been cleared. The vast majority of sovereigns that have defaulted on debt have experienced an unexpected turn of events in which they were not prepared, such as war, regime change, or some other form of political instability, and because of previous fiscal and monetary policies, had very limited policy options, until the point was reached where default became the preferred policy response. Since Catalonia is one of the wealthiest regions in Spain and accounts for such a large percentage of the Spanish GDP, it is foreseeable that the international investment community start to assess whether the potential secession of Catalonia will impact Spain's ability to

continue servicing it's $1.344 trillion-dollar debt obligations (BIS 2017), which is where we will now turn our attention.

### Spain's Economic Structure and Growth

In 2016, Spanish GDP reached $1.233 trillion, experienced a real growth rate of 3.2%, and had a per capita income of $36,400, utilizing the purchasing power parity (PPP) method (CIA 2017). This nation's labor force is composed of 22.89 million persons, with 71.7% employed in the service sector, 24% in industry, and 4.2% in agriculture (CIA 2017). The economy still has not fully recovered because the unemployment rate remains at 19.7%, which means that 3.8 million are still seeking employment (OECD 2017), which remains a challenge for the Spanish economy.

In 2016, the Spanish national government collected $461.3 billion in revenues, while expenditures totaled $512.6 billion, which amounted to a budget deficit of 4.1% of GDP (CIA 2017). Taxes and public revenues equate to 36.8% of the Spanish GDP. The public debt of the Spanish government is equivalent to approximately 1 year of GDP and requires interest payments equivalent to 15.63% of government revenues in 2015 (International Monetary Fund[IMF] 2017). These high debt payments, which are greater than the GDP of a handful of regional governments within Spain, place another strain upon the Spanish economy.

The public debt taken on by the Spanish government is a direct result of the global financial crisis of 2008, which led to a recession where Spain experienced negative growth from 2008 to 2012 (Banco de Espana 2016). In 2009, the Spanish economy contracted by 3.7%, which ended 16 years of steady growth, and increased unemployment from a low of 8.7% in 2007, to a high of 26% in 2013 (CIA 2017). In 2014, the national government secured a European Union bailout package for Spanish banks to address the challenges posed by Spain's depressed real estate and construction markets (European Stability Mechanism [ESM] 2017). This program has been deemed a success, because since 2015, the Spanish economy has experienced growth. The political instability created by Catalonia's aspirations for secession has already caused the Spanish national government to reduce economic growth projections, so it is important to explore the link between political stability and economic performance.

### Democratic Institutions in Spain

There is a causal link between the effective functioning of democratic institutions, political stability, and economic growth. Democratic institutions refer to the structures of government and their ability to respond to the evolving needs of its citizens without being dependent upon any one individual, yet supporting the rights of each individual within the nation. When reviewing Catalonia's aspirations for secession, it is important to assess whether the long term goals and objectives can be achieved within the confines of the democratic structures already in place. Secession is a means to an end, not an end within itself. From a political perspective, Catalonia's government enjoys a wide degree of autonomy, and economically, they are one of the wealthiest regions in Spain, which becomes evident when reviewing the degree of civil liberties and political freedoms enjoyed by Catalonia's regional government and citizens.

Freedom House is recognized as a global authority through their research and analysis of the levels of democratization and political freedoms within countries through the annual *Freedom in the World* rankings. In these rankings, countries are evaluated on the dimensions of political rights and civil liberties. Political rights refer to a citizen's ability to elect their representatives in a free and fair electoral process, political pluralism, the right to vote, and the government's ability to meet citizen needs. Civil liberties refer to a citizen's ability to freely express beliefs, associate, and organize. It also encapsulates the independence of the judiciary, personal autonomy, and individual rights. After assessing the political rights and civil liberties afforded to Spanish

citizens, Freedom House deemed Spain to be a free country and provided them with a score of 94 out of 100 (Freedom House 2017). The degree of political rights and civil liberties enjoyed by Spanish citizens is important in this case because it means that democratic institutions are strong, which is considered by the sovereign debt rating agencies a key indicator of the political stability necessary for economic growth.

Although the Spanish national government has been operating within the confines of the Spanish Constitution to address Catalonia's attempt at secession, there is widespread support for secession from Spain in Catalonia, which creates the possibility of large scale civil disobedience that can be carried out and may have a negative impact on economic activity. Actions of civil disobedience are well within the confines of the rights provided to Spanish citizens. Clashes between protestors and the police have occurred on multiple occasions, which has been the exception rather than the rule, but the potential for escalation of conflict during these altercations is evident.

During the October 1, 2017, referendum that was carried out by the Catalan government, the national government deployed police officers from different regions of Spain to close voting booths because the vote was deemed illegal by the Spanish Constitutional Court. However, even though there were irregularities and the vote was deemed illegal, there was large voter turnout. After police officers sought to close voting booths during the morning hours, which initiated the altercations with voters, additional voters continued to arrive at the poles to demonstrate that they would not be deterred. It soon became evident that police interference with the vote would only cause violence. The interactions between the police and voters were captured by the media, and images of Spanish police officers beating and denying the right of citizens to enter polling stations were broadcast across the globe, which had a negative impact upon the perception of the Spanish government's handling of this issue.

This is an area in which caution by the national government is in order, because even though they are operating within the confines of the Spanish Constitution, and the international community has sided with the national government, many of Spain's closest allies, especially in the European Union, have cautioned against violence. On October 17, 2017, The National Bank of Spain (Banco de Espana) downgraded the 2017 economic growth forecast from 2.5% to 2.3%, indicating that the reason was caused by "a slight containment of domestic demand, resulting from the negative impact of the uncertainty associated with the current political situation in Catalonia" (Duarte 2017). This move by the national government is an acknowledgment of the economic impact the Catalan secession movement is having upon economic growth. However, there has been very little discussion about the fiscal viability of an independent Catalonia.

## Long Road to Stability and Fiscal Viability for Catalonia

The Province of Catalonia is in the north-eastern portion of Spain, with its eastern boundary on the Mediterranean Sea and its northern border is shared with the nations of Andorra and France. This region has a population of 7.5 million residents who have a per capita income of $33,580 and a GDP of $259 billion dollars (National Statistics Institute 2017), which equates to approximately 20% of the Spanish economy. The Catalonia government has been rated as Ba3 by Moody's Investment Services, which means that their debt is judged to be speculative and is subject to substantial credit risk (MIS 2017b). Moody's indicates that as a standalone sovereign, Catalonia's rating would be even lower, at caa1, which means that their debt would be considered speculative, of poor standing and its debts are subject to very high credit risk.

The history of Catalonia as a region dates back well over 1000 years, and during this time a unique culture and language has developed. This runs parallel to other regions within Spain and reflects the diversity found within this nation. During the rule of Franco (1939–1975), Spain was characterized by single party military rule, a

strong emphasis was placed upon establishing a single Spanish national identity, and this culminated in the banning of the official use of Basque, Catalan, and Galician languages, even though millions of Spanish citizens spoke these languages. All government, notarial, legal, and commercial documents had to be drawn up in Spanish, in addition to Spanish being the only language allowed in schools, advertising and in religious ceremonies. As a direct result of the linguistic and cultural suppression of minority groups within Spain, after the death of Franco in 1975, and the development of a democratic constitution in 1978, the Spanish national government provided wide autonomy to the regional governments, which includes matters related to language and culture. Since the late 1970s, schools within Catalonia have been teaching all subjects, which include math, science, social studies, and the arts in Catalan, which has defined an identity based upon language, with most of the youth under 40 years of age educated in Catalan (Frayer 2017).

The Catalan secession movement strongly emphasizes its linguistic difference from the rest of Spain. This movement culminated into a political movement in the 1920s, but only won enough seats in the Parliament of Catalonia in 2012 to form a pro-separatist government. In 2013, the Catalan Parliament adopted the Catalan Sovereignty Declaration, held a referendum in 2014 asking if residents want Catalonia to become independent from Spain, and then held another referendum on independence in October 1, 2017, which has led to the current crisis. Each one of these referendums has been declared unconstitutional by the Spanish Constitutional Court and, since the writing of this article, has not been recognized by the Spanish national government, any sovereign nation, or international organization. However, it has precipitated a showdown between the national government and Catalonia's regional government, where on October 27, 2017, the national government enacted the use of clause 155 of the Spanish Constitution, which provides it with the power to disband Catalonia's government, take over the administrative operations, which include the Mossos d'Esquadra, which is the independent Catalan police force. The national government then held regional elections on December 21, 2017, which then brought the secessionist Catalonia government back to governance on June 2, 2018.

Fiscal policy does play a role in the Catalan regional government's dispute with the Spanish national government. In 2006, Catalonia held an election to expand the powers of the regional government to incorporate the title of "nation" into the regional government's charter. The Popular Party (PP) challenged these alterations in the Spanish Constitutional Court and subsequently won in 2010. This court decision sparked widespread separatist protest in Catalonia and contributed to the tensions between the Catalan government and the central government in Madrid, with tax revenues and expenditures being at the heart of this disagreement.

Every year, Catalonia pays about $12 billion more in taxes to Madrid than it gets back, or around 5% of regional economic output, while Spain's poorest region, Andalusia, receives almost $10 billion more than it pays into national coffers (Berwick 2017). Catalonia's leaders feel that they are subsidizing lower income regions of Spain. In 2012, the Catalan separatist leader requested a new tax redistribution plan from the Spanish national government, which was subsequently rejected by the national government, which was one of the main reasons noted for the Catalan government to move forward with holding a referendum on independence.

## Obstacles to Catalan Independence

There are many obstacles that Catalan leaders must address to successfully secede from Spain, but even if they are able to achieve this feat, the economic and fiscal challenges they would immediately face as a sovereign are substantial. These obstacles can be grouped into the categories of legalities, short and medium-term economic impacts, and uncertainties. When assessing the legalities of the Catalonia secession, this needs to be viewed in the context of the Spanish

Constitution and law, but also from the concept of self-determination under international law. The economic impacts to the Catalonia economy will come in the form of reduced trade with Spain, the European Union (EU), and business relocations. The impact of uncertainties would come in the form of the EU reapplication process, an unstable business climate, and the possibility of a further reduction in credit rating. Each one of these impediments raises serious questions about the fiscal viability of an independent Catalonia; however, taken together, secession poses grave risk to Catalonia's fiscal health and stability.

The Spanish Constitution of 1978 does not permit the referendums or votes on independence, and the Spanish Constitutional Court has consistently ruled that the Catalan referendums for independence are unconstitutional. The only *legal* way for Catalonia to achieve this objective would be through a Constitutional amendment, which is highly unlikely since 3 of the major parties in Spain supported the implementation of Article 155 to disband the Catalonia government. The question of legality provides a real obstacle for the Catalan secession movement to acquire legitimacy in the eyes of European governments and international institutions, which base their own legitimacy on the rule of law. Another challenge that the Catalan attempt at secession poses for European governments is that there are various separatist movements throughout Europe. If Catalonia were to secede from Spain without a legal basis, or a modern history of systematic oppression, it is very hard to legally reason why other secessionist movements should not be able to secede from other nations within Europe as well.

Many separatists are not able to achieve a legal means within the confines of their constitutions to secede, so it is not uncommon for them to claim the right to self-determination under international law. As Connolly (2013) explains, this concept found a legal basis in international law; however, there has been little agreement upon the full meaning of this concept within international law since its inception and has primarily only been applied to the rights of former colonies in Asia and Africa to becomes sovereign states throughout the 1960s. Since the UN Charter Era, only Bangladesh, Eretria, and Kosovo have succeeded without the consent of their parent nation, and each presented unique circumstances where the denial of basic human freedoms and severe human rights abuses exist, which is not evident in Catalonia's case for secession.

The Catalonia separatist movement has made clear that although they want to secede from Spain, they would like to remain within the EU and to retain the Euro as their official currency. However, the EU has made it clear that if Catalonia were to secede from Spain in a manner *permissible* by the Spanish Constitution, an independent Catalonia would need to reapply for European Union membership (European Commission 2017). Article 49 of the European Treaty would also make it difficult for Catalonia to secure membership, because all current members, which includes Spain, will need to approve Catalonia's membership. This can also be a lengthy process and is one that took Spain 9 years to complete. There are also separatist movements in many countries throughout the EU, which would mean that more counties within the EU would have their own reasons for withholding support for Catalonia's entrance into the EU.

The economic implications of Catalonia's drive for independence is also an issue that needs to be assessed. Catalonia's economy contributes 26% of all Spanish exports, with 65% of those exports going to other EU member states, and does not include the percentage that would be passing through the newly established border with Spain (Giugliana 2017). Exports from a sovereign Catalonia to countries within the EU would require payment of the CCT (Common Customs Tariff), which it has been estimated by the Spanish government would increase export prices by 5.7%, in addition to the administrative cost of implementing this tariff, which can add an additional 13% to the cost of exports. This can increase the total cost of exports to the EU by 18.7%. Due to this increase in export cost,

Catalonia's exports would decrease by 13%, which will reduce Catalonia's GDP by approximately 3.8% (Ministry of Foreign Affairs 2012).

Signs of business confidence in Catalonia's government have also started to point in a negative direction, with 1394 companies leaving Catalonia for other regions of Spain between October 2–23, 2017, including two of the region's largest banks (elEconomista 2017). If Catalonia becomes independent, it is reasonable to assume that it will take some time to be granted EU membership, and during the duration of that time, companies located in Catalonia would not benefit from EU membership, which has eliminated all import/export duties between member states and allows for the free movement of labor, capital and services. Losing status as a member of the EU would greatly reduce Catalonia's competitiveness as an investment and business center within Europe. The uncertainty created by the secession process will also have a negative impact upon Catalonia economic competitiveness.

While highly unlikely, the secession of Catalonia from Spain would have a negative impact upon Spain and Catalonia's sovereign ratings. Since Catalonia produces 20% of the Spanish GDP, this would be a considerable loss to the overall Spanish economy, thus, the immediate fiscal health of the Spanish government. However, Spain would remain the sixth largest economy in the EU and in the mid-to-long term recover from this loss. Spain will also have the support of the European Central Bank, in addition to the European Stability Mechanism, which can provide relief in the short-to-midterm if the Spanish government needs assistance in addressing the economic shock brought on by the secession of Catalonia. In addition, the fundamentals of the Spanish economy remain intact, which would leave Spain as an investment grade sovereign. However, the same cannot be said for a sovereign Catalonia.

As of October 6, 2017, Moody's has Catalonia rated as Ba3 (substantial risk), which is one of the lower ratings among Spanish regional governments, and would be significantly lower as a sovereign at caa1 (non-investment grade) if they were not supported by the Spanish national government (MIS 2017b). The Catalonia government has been in noninvestment grade status for many years, which requires them to depend on the national government to meet their debt and refinancing needs, so instead of owing debts to private bondholders, approximately 70% of Catalonia's obligations are to the Spanish central government. If Catalonia were to eventually secede, these debts would need to be paid back to the Spanish national government, otherwise they would be considered in default by the credit rating agencies, which would further exacerbate the negative rating of the Catalonia government.

The uncertainty that would be created through the process of secession would also have a negative impact upon Catalonia's sovereign rating, because issues that have such a major impact upon Catalonia's economy, such as EU membership, would remain uncertain for the foreseeable future. The credit rating agencies view sovereign credit ratings as pervasive, which means that it is very difficult for a domestic issuer to be rated higher than their sovereign, and in the event of Catalonia's secession, issuers based in Catalonia would shift from being residents of investment-grade Spain, to residents of substantial risk, or noninvestment grade Catalonia. This will have a negative impact upon the business climate within Catalonia and will impact the economic growth of this region.

## Conclusion

The fact that Catalonia's GDP is larger than Portugal's, and that it has one of the highest per capita incomes in the EU, makes the economic argument of the viability of an independent Catalonia compelling. However, the obstacles that must be overcome for Catalonia to reach the point of fiscal stability are substantial impediments. First, Catalonia's secession from Spain is not legal under the current constitution, which would need to be ratified through a democratic process in which Catalonia's secession movement does not have the support to get passed in the Spanish national legislature. The region is also evenly split between those for and against

secession, so the prospects of protracted social, political, and economic unrest is present and has the potential to negatively impact economic growth for the short to mid-term. Second, Catalonia would need to reapply to join the EU, which would be a lengthy process that requires all EU members to approve, including Spain. Third, Catalonia would need to address its debts with Spain, which would further degrade its credit rating, which is already rated as a substantial risk, and could likely be downgraded to noninvestment grade upon secession. The Spanish government indicated that an independent Catalonia would need to accept a proportional amount of the Spanish national debt which is equal to Catalonia's share of GDP. In this case, the Catalonia government has the option of taking on the increased debt as a sovereign, or choosing to default. Whichever path an independent Catalonia chooses, this young sovereign would face severe fiscal challenges from its inception.

## Fit: Market and Strategy

Gregory M. Sottile
Townsend Research Group, LLC, Hartland, CT, USA

### Synonyms

Market analysis; Marketing; Marketing strategy

### Definitions

- Early adopters: The segment of all customers (individuals or organizations) that are among the first to purchase a product.
- Firmographics: In contrast to demographics which describe attributes of individuals, firmographics are attributes that describe organizations.
- Market-driven orientation: An approach to strategic planning that emphasizes consideration of external factors, including customers and competitors, that can affect an organization's performance.

### Introduction

Entrepreneurship is pursued by organizations of all sizes and with varied operational interests and objectives. Most ventures begin as small, newly formed entities inspired by the founder's vision. The primary activities of science and technology ventures, for example, typically are focused on research and development. Their objective is to create a technological or process innovation that is central to a future product they want to commercialize. Other entrepreneurs have more immediate economic interests. As such, they may establish a storefront to sell retail products or "hang a shingle" to provide professional services. In the United States, new business creation is occurring at a robust pace. According to the Bureau of Labor Statistics, the number of private establishments less than 1 year old reached an all-time high of 804,398 in 2020 (U.S. Bureau of Labor Statistics 2021, Fig. 1). More than 90% had fewer than five employees. While the small start-up model is the most common form of entrepreneurship, many larger businesses make sustained investments in innovation with the aim of creating new products or establishing new business entities. With rare exception, all organizations strive to increase the venture's value.

### Aligning the Market and Marketing Strategy

The success of a new venture hinges on many variables including leadership, financing, the product portfolio, timing, and, of course, luck. From 1996 through 2019, the 1-year survival rate for start-ups in the United States remained within a narrow range of 75–80% (Kaufman 2020). Longer-term, survival rates decline to 53% after 5 years and 36% after 10 years (US Bureau of Labor Statistics 2016). While a venture's success is far from assured, entrepreneurs can adopt a market-driven orientation to increase that likelihood. A market-driven approach requires careful consideration of the market in which the venture intends to compete. Although sizing a market in terms of the number of customers, revenue, or unit volume is essential for business planning purposes, strategic planning is best informed when the entrepreneur takes a broader view of the market – where it is now and how it likely will evolve – and subsequently develops a strategy that is rationally aligned with the market's realities and

**Fit: Market and Strategy, Fig. 1** Source: US Bureau of Labor Statistics, Business Employment Dynamics by Age and Size

opportunities. Specifically, the entrepreneur should understand the:

- Stage of the relevant *product life cycle (PLC)*
- Needs of *customers*
- Presence and actions of *competitors*

## Product Life Cycle (PLC)

The product life cycle is a theoretical marketing concept in which product categories (as opposed to brands) advance through a series of stages, each of which is typified by a generally common set of market conditions. To understand the PLC and draw insights from its implications, entrepreneurs first must determine the relevant product market into which its offering will compete. For example, Advanced Micro Devices, Inc. is a supplier of microprocessors, its relevant product market. Similarly, Danone S.A.'s relevant product market is yogurt, one of several product markets in which the company competes. The four primary stages of the product life cycle and their characteristics are summarized below:

- **Introduction:** Low overall demand in the market, one or a modest number of ventures selling products to early adopters, limited marketing investments as companies allocate resources toward fine-tuning their product offering and business models, low profitability.
- **Growth:** Accelerating demand, a growing number of competitors whose strategic focus is customer acquisition, rising marketing investments as ventures compete in an increasingly crowded competitive space, improved profitability due to rising volume and improved operating efficiency. Sub-delineations include early growth and late growth.
- **Maturity:** Decelerating demand as the market approaches its maximum sales potential, high competitive intensity as suppliers battle for market share to achieve revenue and volume objectives, relatively high marketing investments as ventures pursue a mix of customer acquisition and retention initiatives, sustainable profits for ventures that possess leadership positions in the overall market or defensible positions in niches within it. Sub-delineations include early maturity and late maturity.
- **Decline:** Declining demand, fewer competitors due to better returns on invested capital elsewhere, reduced marketing investments focused almost entirely on customer retention, increased emphasis on rightsizing and operating efficiencies, profit opportunities for lean companies that are among the last to serve the product market.

The path of the product life cycle is not predestined. Technological innovations or a favorable change in the regulatory market can make a product more accessible or of greater value to a larger set of customers, thus altering the market's pace of evolution. Under such a development, the trajectory of demand in the product category often increases in the growth stage or is rejuvenated in the maturity or even decline stage. The Energy Independence and Security Act of 2007 (US Environmental Protection Agency 2007a) is an example of a regulatory change that affected the US market for light bulbs. The product market of common household incandescent bulbs sold in the United States was adversely affected by this new law which banned the manufacture and sale of most types of energy-inefficient bulbs. This shift in the regulatory environment accelerated the product market's entry into the decline stage of its product life cycle. While not mandating the purchase of specific light bulb technologies, the new law did require greater energy efficiency levels for the most widely used household bulbs (US Environmental Protection Agency 2007b). This greatly increased demand for several types of bulbs that could satisfy the requirements of the law, including high-efficiency light-emitting diode (LED) bulbs. At the time of the law's enactment, LED bulbs garnered a small share of all household bulb sales. The regulatory change catalyzed the growth stage of the LED product market and increased its total potential. By 2020, demand for LED bulbs in the United States was expected to reach $9.9 billion and projected to increase at a 9.6% annual rate to $17.1 billion by 2026 (Mordor Intelligence 2021).

## Customers

Customers are the lifeblood of all ventures. They are its primary source of volume, revenue, and profit. Marketing management has many catchphrases, and some are worth remembering. One of them is "Know your customers!" This clarion call urges entrepreneurs to devote extra attention to understanding the needs of potential and existing customers. Newly established entrepreneurial ventures typically begin with no customers. Their strategic focus should be to align market conditions with their marketing strategy in ways that grow and satisfy their customer base. The term "customers" is broad, and entrepreneurs using a market-driven orientation will benefit from a more expansive application of it. While there are many bases upon which to segment customers (e.g., demographics, firmographics), the following behavioral schema is a productive approach to categorize customers in a market:

- **Brand loyals**: Customers who demonstrate repeat buying of the venture's products. These customers devote a high share of their category expenditures to the venture.
- **Brand switchers**: Customers who divide their expenditures between the venture's branded products and those offered by one or more competing brands. These buyers often rely on price comparisons when deciding which brand to purchase.
- **Other-brand switchers:** Customers of a competitor (or multiple competitors) that also buy from products one or more competing brands. As with brand switchers, most competitors have at least some customers that purchase similar products from another supplier.
- **Other-brand loyals:** Customers who demonstrate repeat buying of a competitor's products. These customers devote a high share of their total category expenditures to that competitor.
- **Potential category users:** Customers that have not purchased anything in the product category but could in the future. As such, they have no prior purchase experience with the venture or its competitors.

It is a productive exercise to quantify the size of each customer segment. Product markets in the introduction or early growth stages of the PLC likely will exhibit a disproportionately high percentage of customers in the potential category users segment. As markets evolve toward maturity, the number of potential category users declines as a percentage of the total and competitors usually possess a mix of loyalists and switchers. Collectively, these market insights can help guide strategy. For example, the venture may uncover unique requirements among its brand

switchers that preclude these customers from becoming brand loyals. In response, it may modify its product offering, adjust pricing, or initiate a communications campaign to overcome barriers to loyalty. Likewise, the venture may identify a growth opportunity among a portion of new category users and then initiate a strategy to target and acquire customers in this segment.

### Competitors

Rarely does an entrepreneurial venture create an entirely new market. In most instances, the venture seeks to establish a position in a market that already exists. While customer needs, especially when segmented, provide insights into the venture's value proposition – the gains offered by the product and the pains it helps to avoid – the venture also must consider the presence and strength of likely competitors. Choosing a marketing strategy that competes head-to-head with an established competitor that has many brand loyals among its customer base likely is destined to fail.

A market's competitors can have a direct influence on the venture's success. Assessing competitors should be an ongoing marketing activity, and it's not uncommon for larger organizations to have staff dedicated to developing competitor intelligence. Competitors may possess core competencies that can substantially impede a new entrant's marketing strategy. Such competencies may include deep financial resources, robust research and development capabilities, extensive intellectual property, well-established distribution systems, and a large and satisfied customer base. Rigorous and ongoing competitor analysis helps the entrepreneur "size up" its likely adversaries. Building on its understanding of customers, the entrepreneur may identify gaps in the market that are not effectively served by competitors. If these gaps are sufficiently large, they can provide an attractive point of market entry for the venture. Similarly, competitors may have weaknesses related to their respective product offerings and business models that can be exploited. Diminishing financial resources, expiring intellectual property, weak leadership, sub-par product quality, and low customer satisfaction are examples of competitor vulnerabilities that could be exploited.

Collectively, a market-driven perspective helps the entrepreneur optimize the fit between the venture's market and its marketing strategy. Insights related to the product life cycle, customers, and competitors will improve strategic decisions about product design, distribution, promotion, and pricing. This knowledge reduces uncertainty, helps focus resources more productively, and provides the foundation for making better decisions more often.

F

## Marketing Performance

The success of entrepreneurial ventures is evaluated in many ways. For some, success is determined by assessing the venture's performance against a set of marketing and financial performance metrics, often referred to as key performance indicators (KPIs). The market penetration rate, for example, is a KPI used to examine the degree to which a new venture's products have been adopted by its target customers. For example, assume the entrepreneur wants to introduce a product innovation into a low-growth, established market that has 10,000 buyers already purchasing products offered by existing industry suppliers. If, after 3 years, the venture has made sales to 500 different customers among this target group, then its market penetration rate is 5%. Market share, measured based on revenue or unit volume, offers additional insight into the venture's relative performance vis-à-vis the overall market. Assume the entrepreneur uses market research to estimate annual sales in this market and finds those total approximately $70 million per year. If the venture's actual sales are $3,000,000 in Year 3, then its revenue share is 4.3%. Similarly, financial metrics often compare the venture's performance to its forecast or budget, thereby providing insight into the current strength of the venture (e.g., its working capital) and the trend in its performance versus expectations. Key financial statements – the balance sheet, income statement, and statement of cash flows – are essential monitoring inputs for all businesses. In tandem with

marketing performance metrics, they help guide the business's overall strategy and its resource allocation decisions.

Marketing margin and return on marketing investment (ROMI) are widely used marketing performance metrics. They provide useful context about the venture's market and its position within it. To illustrate this, assume Tunxis Outfitters is a recently established entrepreneurial venture that produces and sells premium blue jeans (Table 1). The company serves a regional geographic market. During its first year of operation, overall market demand for premium blue jeans in its region totaled 100,000 units, and the company supplied 2000 of those, thus yielding a unit market share of 2.0%. The company's first-year sales were $240,000, and its marketing margin and ROMI were $60,000 and 200.0%, respectively. Tunxis Outfitters's lead entrepreneur is preparing her Year 2 pro forma financials and decides to use a market-driven approach as a guide. She carefully examines the market and anticipates an increase in overall demand. For her company's product line, she expects rising unit sales, stable prices, declining cost of goods sold per unit, and higher advertising expenses. The confluence of these conditions, if they occur, would yield a welcome year-over-year increase in both marketing margin (to $74,800) and ROMI (to 240.0%).

For contrast, assume instead the lead entrepreneur has a pessimistic outlook for Year 2. Market demand is projected to weaken along with the venture's market share, average prices are expected to decline, cost of goods sold per unit will remain at the Year 1 level, and tighter cash flows will necessitate a cut in advertising expenses. Tunxis Outfitters's performance metrics would decline under these conditions of weaker demand and share position.

In practice, the inputs to such an analysis are market-driven. The entrepreneur would use market research or data analytics to estimate the size of the overall market in Year 2. She would have a keen understanding of her target customers' needs and the strength and strategies of her competitors. She would assess whether technology or regulatory conditions will support or impede the goals of the venture. With that knowledge, she would adapt, if necessary, her product offering, pricing tactics, and advertising program to strengthen her strategic position in the market. Like many entrepreneurs, her strategic planning horizon may exceed beyond 1 year. That longer-term view also is supported by this market-driven approach.

**Fit: Market and Strategy, Table 1** Marketing Performance of a Fictitious Company Under Optimistic and Pessimistic Scenarios

| | Tunxis Outfitters (Supplier of premium blue jeans) | Year 1 | Year 2: Optimistic Inputs % Δ | Year 2: Optimistic Performance | Year 2: Pessimistic Inputs % Δ | Year 2: Pessimistic Performance |
|---|---|---|---|---|---|---|

The effectiveness of her strategy in Year 2 will influence the strategic options, and the venture's success, in Year 3 and beyond.

## Case Studies

Marketing strategy is a demanding discipline, often made more complex by the ever-shifting dynamics of the market. There is no shortage of case studies. The following briefly demonstrate how fit (or lack thereof) between the market and strategy influences success.

### Poor Fit: Pfizer's Exubera

History is rich with examples of failed ventures and product launches. Even the vast resources and expertise of a large organization do not ensure success. In 2007, pharmaceutical giant Pfizer announced it was ceasing production of Exubera, the world's first inhaled insulin, in just its second year of commercialization. Prior to 2007, insulin typically had been self-administered via an injection. At first glance, conditions seemed favorable for this product launch. Overall market demand for insulin products was high and expected to grow. Pfizer's former CEO Henry McKinnell described Exubera as a "major medical breakthrough," and the company believed that the novel inhaled product would be widely accepted by consumers. Pfizer itself had projected Exubera's worldwide annual sales to reach $1.5 billion by 2010 (Fierce Pharma 2010).

Unfortunately for the company and its stakeholders, the fit between Exubera's market and its marketing strategy was poor. Pfizer overestimated the innovation's customer appeal and thus its customer adoption rate. The company had expected Exubera's no-needle delivery system to spur demand for the innovation, but by 2008, insulin injection needles had become so small that many of the company's target customers had no concerns with self-injection and thus had no need to switch. Simply put, Exubera's value proposition was not compelling enough to capture the sales it projected. Consumers were largely satisfied with the products offered by Pfizer's competitors.

Exubera's strategy was not aligned with the market, and the brand underperformed as a result. Pfizer took a $2.8 billion write-off because of this failure (Fierce Pharma 2010).

### Strong Fit: IBM Watson

As part of their long-term strategy, large organizations often use cash flow from existing lines of business to finance the launch of new products or ventures. International Business Machines (IBM), founded in 1911, has a rich history of innovation and is an example of such an organization. The company demonstrated strong fit between its market and its marketing strategy as it adapted to changing consumer preferences and competitive intensity. In so doing, it modified its product market focus away from computing machines and toward more productive opportunities.

Through the 1950s and 1960s, IBM was a world leader in the sale of computers and related components, producing nearly 70% of all business computers purchased globally. IBM maintained this market-leading position into the early 1990s. By that time, the global desktop computer market was well into the late growth stage of its product life cycle and had attracted aggressive competitors including Dell and Hewlett-Packard. Increased competitive pressures diminished IBM's share position as the personal computer market approached maturity. In 2005, IBM sold its personal computing division to Lenovo in a strategic shift away from hardware and toward business services (Reed 2020). This adjustment was well-timed for IBM, as demand for management consulting services, particularly those related to information technology, was in the growth stage of its product life cycle. Soon after, the company began work on IBM Watson, a computing software innovation based on artificial intelligence. Through a natural language processing interface, Watson drew on vast databases to answer questions quickly and accurately. Watson's pace of development was rapid. During 2011, the innovation competed on the game show "Jeopardy!" and resoundingly beat its human opponents. Market interest in artificial intelligence was growing too, and in 2014, IBM

established the Watson Group, a new venture headquartered in New York that was dedicated to advancing Watson's commercialization. By 2016, hundreds of IBM clients and partners, spanning 36 countries and dozens of industries, were actively engaged in projects using Watson (Noyes 2016).

### Strong Fit: Amazon.com

When Jeff Bezos incorporated Amazon.com, Inc. in 1994, his initial marketing strategy was to sell books online. At that time, Amazon.com was a small company serving the modest but emerging market of digitally enabled customers through its e-commerce marketplace. Market forces favored Amazon.com at its launch and continue to favor it today. In its early days, the company benefited from rapid expansion of the technological infrastructure that enabled online commerce. A study by the Pew Research Center found that as the US market for home computers grew, so too did the number of households with Internet access. Just 1 year after Amazon.com's launch, 18 million US homes were modem-equipped, an increase of 64% from the prior year (Pew Research Center 1995). Consumers' online accessibility grew substantially. By 2015, 84% of adults in the United States were Internet users, up from 52% in 2000 (Pew Research Center 2015). Their attitudes toward purchasing products online also were evolving. They were increasingly comfortable transacting online and demonstrated this confidence by spending. From 2010 through 2020, e-commerce retail sales in the United States grew at a compound annual rate of 17.6% to $861 billion, a value that accounted for 21.3% of total retail sales during the most recent year. By comparison, e-commerce sales were 6.8% of total retail sales just 10 years before (Ali 2021).

Over time, Amazon.com fortified its own infrastructure by investing in an extensive network of fulfillment centers. The company anticipated customers' desire for fast and free order delivery, and they were positioned to satisfy that need. In 2007, the company launched Amazon Prime, a membership service which, for a modest fee, featured extra-fast delivery of millions of products inventoried in its own warehouses. Amazon Prime was a resounding success. Consumers' needs were being addressed, and no competitor had the equivalent warehousing and logistics capacities to counter the company's value proposition. By 2020, Amazon Prime membership had grown to more than 95 Americans, equivalent to nearly two-thirds of the Amazon.com's total US audience. Prime members contribute substantially to Amazon's top line, typically purchasing more than $1000 a year of products on Amazon.com (Repricer Express 2021).

Amazon has evolved into the world's largest e-commerce company. Their business portfolio has grown and now includes Amazon Web Services (cloud computing), Amazon Prime Video (streaming video), Amazon Music (streaming music), Whole Foods (organic food retailer), and more. It is one of the world's most valuable companies. In 2020, its share of total US e-commerce sales was expected to reach an all-time high of 38.7% (eMarketer 2020). By the end of 2020, the company, which trades on the NASDAQ market under the ticker symbol AMZN, had reached a market capitalization in excess of $1.5 trillion (Yahoo! Finance 2021). Market forces create opportunities for success and barriers that can impede it. Keen entrepreneurs adapt their marketing strategies to navigate these dynamics, and Amazon.com has done that. The company has come a long way since its days as "Earth's biggest bookstore." Today, its current mission is to be "Earth's most customer-centric company" (Amazon.com 2021), a timely reminder that even after its many remarkable achievements and subsequent business valuation, the company still is committed to a market-driven orientation that puts customers first.

### Strong Fit: Whole Foods Market

Whole Foods Market was established in 1980 in Austin, Texas, following the merger of two small businesses – a natural foods store called SaferWay and Clarksville Natural Grocery. The new venture featured a 10,500 square foot establishment and 19 employees, and it was one of fewer than a half-dozen natural food markets in the United States (Whole Foods Market 2021). Market demand for organic products during that year was just

$178 million (Janoff 1999, p. 75) at a time when total retail sales at food stores equaled $212 billion, or less than one-tenth of one percent of all food store sales in the country. The organic food product market in the United States was in the introductory stage of its product life cycle.

While a small company in 1980, Whole Foods Market was in the fortunate position to compete in a product market poised to grow robustly over the coming decades. To its strategic benefit, consumer preferences and behaviors were changing in favor of the company and its product offering. The company highlighted these changes in its 2000 Annual Report, citing the following as key market forces propelling sales of natural and organic foods:

- Increasing consumer concern over the purity and safety of food
- Environmental concerns due to the degradation of water and soil quality
- Healthier eating patterns driven by a better-educated populace (Whole Foods Market, Inc. 2000)

These consumer preferences and behaviors propelled the organic food market into the growth stage of its product life cycle. Fruits and vegetables, the top-selling category of organic food products in 2000, is an example of consumer interest in organic products. Sales of these products had, for the first time, exceeded $2 billion, roughly a tenfold increase from 1990 (Dimitri and Greene 2002). The performance metrics of Whole Foods were extraordinary as well. The company's sales during 2000 were $1.84 billion, nearly double those reported in 1996, while its operating income crossed the $100 million mark for the first time in the company's history (Whole Foods Market, Inc. 2000).

Consumers were hungry for organic food products, and Whole Foods intended to serve that demand. The company pursued a strategy of acquiring customers new to the organic food market and by earning share from smaller competitors. Aggressive retail expansion and larger store sizes were at the core of this strategy. The company's 2000 Annual Report states its plan succinctly: "Our strategy is to expand through a combination of new store openings and acquisitions of existing stores." By 2000, the number of Whole Foods retail stores had risen to 117 from 68 in 1996, while its average store size grew to 27,200 square feet from 23,000 (Whole Foods Market, Inc. 2000).

In 2007, the company merged with Wild Oats, adding 109 stores in 23 states and British Columbia, Canada, to the existing network of Whole Foods locations (Whole Foods Market 2021).

In June 2017, it was announced that Amazon.com would acquire Whole Foods in a deal valued at $13.4 billion (Wingfield and de la Merced 2017). Whole Foods, 2017 Annual Report, its last as a publicly held company, highlighted its extraordinary success: $16.0 billion in sales, 470 stores in across several countries, and 89,000 "team members" (Whole Food Market, Inc. 2017). The adage "All boats rise in a rising tide" applies to Whole Foods Market. Entrepreneurial ventures typically benefit when a market is expanding because the expansion provides an opportunity for the venture to appeal to the wave of first-time customers entering the market. Customer satisfaction and loyalty usually occur when a brand's product and service offerings address the needs of consumers. Whole Foods was positioned to grow in a growing market, and it provided customers with a consistently strong value proposition that supported repeat patronage. Thus, it acquired customers and effectively retained them, thereby increasing customer lifetime value and the value of the business as well.

### Strong Fit: Uber Eats

Innovation is a critical success factor for many companies. Among entrepreneurs, a single innovation can be the spark that launches a thriving business. For larger organizations, innovations often establish the gateway pipeline of future products and lines of business. Uber Eats is an example of innovation by Uber Technologies, Inc. (i.e., "Uber"), a large company. Founded in 2009 and headquartered in San Francisco, California, Uber is one of the world's leading ridesharing providers, and the market leader in

the United States. During 2019, the company's gross booking for "Rides" reached $49.7 billion, a 19.7% increase from the prior year (Uber Technologies, Inc. 2020). Uber Eats, established by Uber in 2014, is an online food ordering and delivery service operating in the United States and more than 30 other countries (Uber Eats 2021). It operates in the platform-to-consumer delivery segment of the overall online food ordering and delivery service market. Consumers use online applications to find participating restaurants in their area, place orders and make payments via the app, and have the food delivered by an authorized driver.

The business models of platform-to-consumer food delivery services (e.g., Uber Eats, DoorDash, and Grubhub, among others) are nuanced in that each transaction serves the interests of two primary segments – consumers who want food delivered to their residence or workplace and restaurants (as collaborators) that want to supply it. Among consumers, convenience through digitization is a primary motivator. Consumers increasingly seek alternatives to cooking at home or dining in a restaurant, and they are allocating a growing amount of money to satisfy that need. The National Restaurant Association's 2019 State of the Restaurant Industry report found that more than half of US millennial diners (prime users of platform-to-consumer services) reported placing a takeout or delivery order from a restaurant in the past 12 months while over 60% want restaurants to use technology to facilitate ordering and payment (National Restaurant Association 2019). By adapting to these changing preferences, restaurants have the opportunity to tap into a source of revenue that they otherwise might not have if they relied solely on in-restaurant dining. Many are doing just that. In 2019, Uber Eats was supported by 600,000 restaurants, an increase of 173% from 220,000 in 2019 (Curry 2021).

This confluence of consumers' needs and restaurants' willingness to adapt to those needs has created business opportunities for Uber Eats to facilitate these connections. While the market is large and growing, it's also very easy for consumers and restaurants to adjust their affinities and alliances, thus making this an extremely competitive market. Despite that, Uber Eats has enjoyed solid performance. During 2020, gross bookings grew 108% from the previous year to $30.2 billion (Curry 2021).

## Conclusion

Marketing management involves the practice of acquiring and retaining customers profitably over time. It is a challenging endeavor that is characterized by consideration of a blend of uncontrollable and controllable factors whose interplay drives performance. Uncontrollable market factors represent the full set of external forces. At best, entrepreneurial ventures have limited influence over these factors which include a product market's life cycle stage, the needs of customers, and the actions of competitors. Controllable factors are completely managed by the entrepreneur. They include marketing strategies related to its product offering, pricing structure, method of distribution, and promotional program. Success is a function of how well these marketing strategies fit, and even exploit, the set of uncontrollable market factors that exist in the market. Successful ventures strive to optimize their fit over the long term by anticipating shifts and adapting when strategically appropriate.

# Fixed Price Contracts

Christopher L. Atkinson
University of West Florida, Pensacola, FL, USA

## Synonyms

Firm fixed price contracting; Sealed bidding

## Definition

Fixed price contracts are used "when the risk involved is minimal or can be predicted with an acceptable degree of certainty" (FAR 16.103(b)). Fixed price contracts result from a bidding scenario, in which a vendor offers a price for a given set of requirements, and awards are based upon prices received through sealed bidding without major discussion. Such agreed price contracts are dependent on the basic business motive of profit: the more the vendor stays below the bid amount in costs associated with the requirement, the higher the profit. Fixed price contracts in public procurement are different than the usual legal meaning of "fixed price," an often illegal arrangement where "a price is agreed upon by wholesaler and retailer for the later sale or resale of an item" (*Black's Law Dictionary* 1381 (10th ed. 2014)).

## Introduction

Fixed price contracts are among the most commonly encountered contracting styles in public procurement. They are typically associated with the purchase of supplies (commercial items) and first or follow-on production (as in 32 CFR § 3.9), where the requirement specifications are well-known, and there is no need to allow for discussion with vendors or negotiation on the nature of the specifics. Fixed price contracts are considered steadier from the government standpoint – shifting risk and reward to the vendor – because payment ultimately is aligned with receipt of products or services; matters generally are not as adjustable as would be the case in a cost-contracting scenario. In a standard fixed price contract process, the public entity sets forth a solicitation requesting sealed bids; vendors respond to the specifications with their pricing for the products and services requested by submitting bids as noted in the bid request. The entity holds a bid opening (potentially held in a public forum), so that bids received and an apparent winner on the basis of price noted. Efforts are then made to award to the apparent low bidder, barring any technicalities or protests. The successful bidder is reasonably expected at that point to hold firm to the offer made and honor the agreement in providing the product or service at the fixed price.

This entry considers fixed price contracts in their public utilization, with examples of standard fixed price contracts, and fixed price contracts allowing for economic price adjustment.

## Fixed Price Contracts

At the root of any discussion of fixed price contracts are central notions of contracting. "A contract is a mutually binding, legal relationship that obligates the seller to furnish supplies or services and the buyer to provide consideration for them" (NCMA 2019, p. 2). "Each of the parties to the contract must possess legal capacity to contract; the parties must each manifest assent to the terms of the agreement; the promise to be enforced must be supported by consideration; the agreement must not require the performance of an illegal act by either party; and the agreement must be in the form required by applicable law" (Cibinic and Nash 1986, p. 151). The government party must have authority to bind the government for the contract (O'Connor 2007). Consider that both parties have to agree: one party offers, and the other accepts the offer. In the case of firm fixed price contracts, the agreement is generally clear: given a specification offered by the public entity, a vendor has responded with a bid to provide that requirement for a certain price. If the offer is accepted by the government entity, and all other standards of contracting are followed, the contract may be made through the manifest agreement, arrived at through the bidding process. The vendor then has a duty to perform as agreed, given the contract. As long as the process does not deviate from this standard, fixed price contracting is fairly straightforward.

However, confusion can enter the process in a variety of ways. The invitation for bids that leads to the formation of a fixed price contract must be unambiguous and clear, with a well-defined scope of work or services. "Nearly every procurement begins with an attempt by government officials to identify their agency's basic needs and to formulate a description of work to be required under a contract which will satisfy those needs. . .these provisions are collectively referred to as the specifications. . .as the fundamental expression of what a potential contractor's obligations will be, specifications are the basis of the formation of offers" (Cibinic and Nash 1986, p. 337). With a considered view of the agency's requirements, and enough notice from a viable vendor pool, the invitation for bids stands a better chance of success in attracting a successful bidder. When commercial items are being required, and in those instances, firm fixed price or fixed price with economic adjustment contracts are common forms for the eventual contract. In instances where the delivery schedule is not known and may extend years into the future, the economic adjustment alternative may be most advisable (Engelbeck 2002).

Within the grouping of fixed price contracts, there are several variations, including contracts based on achievement of a sustained level of effort over a period of time; fixed price contracts that include an incentive component for timely receipt of product or service; and fixed price contracts that may be periodically adjustable for economic considerations (these are discussed in the following section).

A potential disadvantage of a standard fixed price contract is that the vendor, in accepting most of the risk of the contracting arrangement, may build possible variability of costs into the bid amount, yielding a higher bid price than might be possible given a cost-plus contracting scenario. From the vendor side, fixed price contracting can be disagreeable in the long run, given that inputs into manufacturing processes, for example, can be highly variable. This can lead to a contract that made good business sense when it was signed, but years later, the costs become prohibitive, and the arrangement results in a loss for the company. The amounts involved in a bid could lack detail, so it can be more difficult to know why a bid resulted in a price higher than what might have been expected.

If costs increase, the fixed price option is most expensive of the common contracting options (cost-plus, gain sharing); if costs decrease, the fixed price option is relatively cheap and a potentially excellent deal for the vendor. The problem is that information needed to make the best deal, from the vendor or public entity perspective, may not be available; as a result, suboptimal deals are made (Yao et al. 2010). However, the certainty of knowing the price in advance can assist with budgeting activities – a definite benefit to the public entity.

## Fixed Price Contracts with Adjustment Factors

There are situations where a contract may play out over an extended period. Initial evaluations of potential costs of the contract for the vendor, and of responding to unknown utilization patterns, are rendered void. In those instances, the public entity might offer a fixed price contract with the possibility of a periodic (more or less often as required) review of market factor costs and potential for adjustment of price to pay for the product or service. Given the asymmetry of information in fixed price contracting generally (Tegner et al. 2017), government's interest in the completion of the contract, and in fairness, the right of the vendor to make some reasonable profit for their work and not be put out of business, the contracting approach that includes an adjustment factor can be the best choice in situations of long contract term, unknown potential utilization, and variable market costs that impact heavily on the price and profitability associated with the contract. With the inclusion of an adjustment potential, the vendor will have less need to hedge their pricing against unknowable forces and a greater possibility of providing "true pricing" at the outset. This allows the vendor to better manage risk and pass as savings to the government what would ordinarily be kept as a hedge against future loss.

## Challenges Associated with Fixed Price Contracts

Governments may have a preference for simplified acquisition procedures and find the fixed price contracting approach unnecessarily restrictive, particularly if there are no alternatives available in procedures at certain levels of contracting. In cases of urgent need, the formal bidding process may slow what could be simple commercial purchases (Mishory 2012). While consistency affords fairness, the wheels of process can grind slowly from a business perspective, breeding contempt in both the vendor community and in the ranks of procurement professionals. This is a problem when process and assumed administrative rigor do not result in real, quantifiable, and demonstrable added value for the client agency, the government generally, or the taxpayer.

In instances when modifications to an existing contract are necessary, the process for instituting changes can become quite burdensome for fixed contracts. Contracting officers must be careful

with modifications, especially when draft changes incorporate elements of cost price contracting, which are neither allowable or appropriate (e.g., including time and material costs, when completion of a fixed price contract would reasonably entitle the vendor to the total value of the contract). It is important for both buyer and seller to review all terms for potential ambiguity and conflicting language (Horan and Stanton 2014), because inflexibilities are a serious drawback for fixed price contracts (Yao et al. 2010).

While public entities may wish to reduce their risk, shifting it to the vendor, fixed price contracts commonly have not been shown to result in optimal outcomes, given that the vendors themselves are also risk averse. The result has been that there is less effort from both efficient and inefficient vendors (Deneckere et al. 2019). Fixed price contracts give vendors incentives to cut costs and to increase their profits; there is little incentive to improve infrastructure to support service delivery (Gong et al. 2018). There can also be gamesmanship with the timing of fixed price contracting and the length of contract offered: a long contract may bank on known market changes, which could benefit the buyer, and be reduced in length to cut off potential value to the vendor. Fixed price situations also encourage potential vendors to find out as much information as they can about the product or service and costs associated with provision; this alone can increase costs, unless price adjustments are included in long-term contracts to avoid the tendency (Zhu 2000).

While there is evidence that fixed price contracts may provide lowest prices, at least as a group, relative to cost-plus contracts and menu-type contracts based on unit pricing, there is potential for less-than-independent pricing and collusive behavior (Paul and Gutierrez 2005) and the potential for change order requests later to eliminate any initial savings over other contracting approaches.

## Conclusion

Fixed price contracts remain a standard contracting approach, given the supposed objective nature of their attendant processes and value in pure competition on requirements with well-defined criteria. However, there are nevertheless a variety of challenges associated with this contracting format, which, while manageable, must be acknowledged and addressed by contracting officers to avoid complications and delays in acquisition processes.

# Flattening Organizations

Renee Prunty
Methodist College, Peoria, IL, USA

## Synonyms

Decentralized organization; Flat hierarchy; Flat organization; Horizontal organization

## Definition

An organizational structure with few or no middle managers that typically uses decentralized decision-making.

## Introduction

All public administrative agencies have some form of structure or hierarchy that determines the interactions within the agency. Traditional bureaucracies, since first discussed by Max Weber, champion a clear hierarchical structure with an emphasis on the vertical relationships. However, there has been a recent push for agencies to adopt a more flattened or horizontal organizational structure with roles that are not as clearly defined. A flattened organization means there are few or no levels of management between employees and administrators at the top with all or most employees being viewed as on the same level. Organizations that choose this format generally use a decentralized decision-making process, since there are few or no middle managers. It is important to understand how differences between the number of vertical layers and the width of those layers affect organizational effectiveness and control.

## Flattened Versus Vertical Hierarchy

Public administration is generally viewed as having a hierarchical organization as first envisioned by Max Weber, which has come to consist of many vertical layers. Weber's ideal for an efficient bureaucracy needed a steep hierarchical structure in order to ensure a seamless flow of information from top to bottom. Within this model there are specializations, impersonalizations, and divisions of labor. There are also a lot of formal rules and procedures to ensure that these characteristics are maintained. The belief by Weber was that this formalization will lead to a more efficient system, which was his ultimate goal. This model is usually typified by a pyramid or triangle-shaped hierarchy. The largest number of employees are at the bottom of the pyramid, with each higher level having fewer employees than the one below until there is one manager or administrator at the top. There are generally several vertical layers. Within this structure, employees understand their role based on their position in the hierarchy (1947).

Weber's "ideal" bureaucracy, however, is not without its flaws. Despite Weber's emphasis on the workers, by stressing efficiency, it leaves many within the organization feeling unappreciated, unheard, and generally lost in the process. The restricted top-down communication may lead workers to feel that their voice is not important. There is also limited discussion between departments, which means that one group does not know what another group is doing. This can leave both employees and those receiving their services exacerbated as information needs to be repeated over and over again. Finally, the hierarchical structure encourages these divisions rather than creating ways to manage or minimize divisions between groups or even employees. This can make individuals feel isolated even when they are part of a large organization. The dissatisfaction is not limited to those working within these agencies, because Weber's model does not take into consideration those the organization serves. The end users also tend to feel unappreciated, unheard, and generally lost in the process. These challenges have led some to pursue alternatives to the vertical hierarchical model. One of those alternatives being a flattening of the organization. A movement to reinvent public administration began in the 1980s, by shifting the focus from what was happening or taking place in

the organization to how the organization was serving its clientele (Ho 2002).

Flattening of an organization means there are fewer layers between the employees at the bottom and the administrators or managers at the top of the agency (Worthy 1950). In this system, there are very few and sometimes only two vertical layers. Instead, there is a wide horizontal layer at the bottom. This type of organization gives up some vertical control in favor of horizontal coordination (Li et al. 2016). A flat organization places most employees at the same level of the organization, although that level is usually at the bottom of the hierarchy. While this gives employees equal standing within the agency that is not always ideal, since it often means there is one manager overseeing a large number of employees and there are limited opportunities for advancement. It does, nevertheless, create a more open environment where employees are encouraged to bring ideas to anyone else without having to go through a chain of command. As a result, employees are more involved in decision-making due to the increased coordination and decentralization of the process. There are just some of the many issues that need to be considered when determining the best hierarchical structure of an organization and whether a flat organization is the right choice.

## Benefits of a Flat Organization

There are many reasons to consider a flat or flatter organizational structure over a steep vertical hierarchy. Flattening an organization removes many of the problems created by Weber's ideal bureaucracy. In a flat organization, there is better communication in all directions, an ability to make quicker decisions, and it can be less costly than a hierarchy with many vertical layers.

Communication in a hierarchical organization with many vertical layers generally moves from the top down, but in a flat organization there are more directions of communication. The lack of a clear hierarchy allows for horizontal communication as well as increased vertical communication. In a flat organization, there tends to be fewer barriers between groups within the organization so individuals from one group are able to easily communicate with individuals from another group. In addition, the fewer levels of management allows more employees' access to communicate with the administrators at the highest levels of the agency. There is more of a sense of one organization rather than individual departments when communication is able to freely flow through an organization, and this is generally viewed to be favorable by employees, managers, and those they serve.

An advantage of better communication in a flat organization is that it allows for faster decision-making. In a hierarchical design with many vertical layers, information flows mostly from the top, but there are times when information is needed from those at the bottom of the hierarchy. In these types of organizations, the information typically flows up slowly through each level of the organization; however when an organization is flat, it allows for communication to flow in all directions without following a restricted chain of command. This allows for information to reach the decision-makers more directly and more rapidly, since it will pass through fewer layers to reach its intended target. This helps speed up the decision-making process. Prompter decision-making is generally viewed as a positive by administrators, employees, and those they serve.

There is also a cost-saving benefit, which can be viewed as a benefit to the organization but could be seen as a negative by those who work for the organization. The removal of middle management positions is a cost-saving benefit of flat organizations. Since the majority of positions are now at the entry level or bottom level of an organization, they will typically get paid less than middle managers. Having fewer managers will decrease the salary and wage cost of an organization. This, however, can decrease the potential for hiring and keeping talent at the agency, particularly by individuals who feel valued based on their title and pay. These employees may feel underappreciated and unhappy in flat organizations. Some individuals, on the other hand, may find that the other benefits like more direct access to administrators, improved communication, and

involvement in decision-making are worth the sacrifice of better pay or better titles bestowed on middle managers. Individuals who value their ability to provide input and innovate with little supervision may feel more valued and happy in flat organizations even when making less money, particularly if the money that would have been spent on middle managers is spent on innovation or providing other benefits to employees. A flat organization can save administrative costs, but it is not without costs of its own.

## Potential Problems with a Flat Organization

The flatter organizational structure creates opportunities not present in a more traditional bureaucratic organization, but it also creates some barriers or problems for the organization. There are many benefits to flat organizations that may make agencies want to change their organizational structure, but there are also many challenges that should be considered before determining if this is the best organizational hierarchy for a particular agency. It is important to consider potential problems, such as a likelihood for duplication of roles or work, a potential for poor relationships between employees and with managers, and the possibility of less control by administrators.

A flattened organization allows for improved flow of ideas and more flexibility in job roles, but this can also lead to potential problems. A typical bureaucratic organization is characterized by its clear job roles and specializations of employees; however this inflexibility of job function is one of the reasons for advocating for a different organizational structure. Nevertheless, without clear barriers between jobs and groups, there is a risk of duplicate roles. A flat organization does not maintain the clear distinctions between groups or even specific functions within a group. This can lead to overlapping or duplicate responsibilities within the agency. If everyone is working in a spirit of collaboration, then it may go smoothly. However, if roles or work is being duplicated, it can be costly to the organization or could potentially lead to conflicts between employees. The potential for this to happen is greater in a flat organization given the design of the organization.

A flat organization means that one manager may have to manage a larger number of employees than what they would typically manage in a vertical hierarchy. Managers may have as many as 30 direct reports. This can lead to a lack of a rapport between the manager and each individual employee because even the best manager will have difficulty building close relationships with up to 30 employees. This can lead to problems for both the managers and the employees as it is important that the manager adjusts to the varying needs of the employees (Ghiselli and Siegel 1972). Some employees may feel disconnected from the organization, which may lead them to share less with their manager. This can lead to poor decision-making on the part of the manager and could potentially lead to situations where the manager is unaware of what the employee is doing. Employees who feel empowered when they are given autonomy, however, will thrive in these types of environments. Managers have to know how to deal with different employee expectations.

Additionally, when most of these employees are on the same level, there are fewer positions in which to promote employees, which can lead to competition among employees. This competition can further hurt relationships between employees. Most changes within the organization will be horizontal, which is often less satisfying than a move up in an organization. This can lead to a struggle for power or competition among employees competing for limited opportunities. This could hinder collaboration between employees who are unwilling to share information or what they are working on due to a risk of not receiving full credit for their ideas. While a flat organization can encourage communication and collaboration between employees and administrators, there is also a potential for problems to occur.

The problems that can arise between employees or between employees and managers in a flat organization can have enormous ramifications for the agency. When the organizational structure is more horizontal or flat, then there is less vertical control over the day-to-day

operations. The design of a flat hierarchy means that one manager or administrator will have a large number of employees to monitor. This will decrease the manager's ability to monitor everything that is happening within the agency. If everyone is doing their job and following the agency's agenda and meeting their goals, then this will not matter. However, if problems arise with an individual or group of employees, it may take longer for the manager or administrator to determine the problem or issue and correct it. The risk of losing control will depend on the size of the agency. The smaller the agency the lower the risk, while large agencies with flat hierarchies will have a greater risk of problems due to the inability to control every situation. As a result, agencies where the benefits of vertical control outweigh the coordination costs a vertical hierarchy is preferred. However, if the improved coordination of a horizontal hierarchy outweighs the costs of vertical controls then a flat organization is more ideal (Li et al. 2016).

## Conclusion

The improved communication and ability to make quicker decisions leads to a more positive work environment. Employees feel more empowered in a flat organization, which tends to lead them to feel more positively about the agency. However, there is a potential for problems to arise in flat organizations stemming from the same structure that makes them ideal; consequently an agency should consider the benefits and potential problems before deciding which option is best.

**Organizations** are currently defined as streams of **organizing processes. Organizing is a process of patterning interactions and communications** by subjecting them to formal constraints and controls. Most organizations in contemporary societies are **professional bureaucracies**. **Organizations impose a rigid division of labor, establish chains of command**, **and operate through hierarchy by**

**assigning responsibility and accountability** to their human members. However, functioning among unpredictable contingencies often requires breaking the formal rules. This is how flexibility enters the definition of organizations and organizing. **Flexibility is measured in an improved ability to cope with unpredictable challenges emerging from complex, evolving environments and in development of hybrid forms**. Complexity of continuously changing environment, reflexivity of human individuals, and social learning trajectories influence organizing individuals, prompting creative improvisations. Flexibility grows at the expense of hierarchy. Flexible development and change of organizing processes and structures improve organizations' problem-solving capabilities and skills. **Flexible organizations are considered more agile and adaptable and more resilient and adjustable to an ongoing reengineering process than the bureaucratic ones**.

## Introduction

Organizations as artificial social constructions have been first systematically defined by a German sociologist Max Weber as imposed patterns of cooperation supported by rational authority and sanctioned by legal regulations. He had introduced the concept of an "iron cage" of the strictly hierarchic social division of labor, which leaves much more power and authority in hands of the elites at the expense of the rest of modern societies. His fellow sociologist, Robert Michels, spoke of an "iron law of oligarchy," which prompts every complex organization, for instance, German trade unions, to gradually reject democratic principles and to develop an oligarchy. Another sociologist, Vilfredo Pareto, saw the struggle of these oligarchies within all complex bureaucracies as the engine of democratic change and called it "the circulation of the elites." Weber's sociological theory of organizing had influenced emergent management studies. Their first representatives (Henri Fayol, a French mining engineer, and Frederic Winslow Taylor, a mechanical engineer in the USA) devoted their attention to individual work designed as a job in formal organizations. They believed that if all job tasks are studied scientifically, the best way of performing each job can be found, and each worker can be trained to adopt it. Their principles boil down to a replacement of intuition and rule of the thumb with a systematic, objective, and scientific study of the working tasks. They have also promoted a division of jobs into managerial or white collar jobs and the blue collar or operative, worker jobs. This theoretical foundation for scientific management had subsequently been popularized by Henry Ford as the "Fordist" principles of rational management and broadly accepted in industrializing world (including the Soviet Union). At the same time, this theoretical foundation for scientific management had been bitterly criticized by Charlie Chaplin in his movie "Modern Times," in which the rhythm of the assembly line in an industrial plant turns all workers into cogs in a relentless machine, racing to cope with the imposed speed of their activities. Chaplin found allies among sociologists. Max Weber's formal definition of the official bureaucratic backbone of formal organizations has been criticized by sociologists, anthropologists, and other social researchers. They had been studying actual interactions and communications among real, actual members of formal organizations, among workers in industrial plants and offices. While doing so, researchers started detecting informal, human underside of organizing processes. They had started identifying power games and contingencies, informal processes, and emergent leaders. They realized that following Max Weber's "ideal types" of a formal professional bureaucracy as a paradigmatic case of an organization would mean rejecting empirical evidence, which suggested many different types of organizing and of attaining flexibility, not all of them compatible with an ideal one. Elton Mayo's experiments with the office clerks in Hawthorne, who worked more productively when their working arrangements were modified, became a milestone in organizational and managerial research. Hawthorne studies have become the pioneering foundation of the more humanist and human resources centered types of management. This research focus

produced, among others, the "Quality of Working Life" paradigm of a flexible management of professional organizations, which considers the work-life balance of the employees and tries to redefine and readjust jobs – aligning them with the employee preferences. Managers are supposed to align individual personal attitudes with the collective, coordinated patterns of working together (Daft 1998; Cummings and Worley 2005).

## Dimensions of Flexibility in Organizations

Historically speaking, all organizations have encountered the dilemma of a choice between hierarchy and flexibility. Roman imperial bureaucracy and Pope's Christian church clergy were organized in hierarchical structures, but local managers were allowed a leeway, which enabled them to preserve flexibility and freedom of maneuver in face of unpredictable contingencies. The flexible organization empowers local managers to act without having to follow chain of command up to the chief executive officer. However, the CEO still preserves formal authority and material responsibility – should anything go wrong, he or she will be held responsible for a local manager's decision. The replacement of a rigid hierarchy with a matrix form signaled the first step toward a structural, permanent inclusion of flexibility in an organizational bureaucracy. If all employees are grouped both under their functional hierarchies (of, say, marketing or financial managers) and the regional ones (of, say, a Central Europe Middle East Africa, i.e., CMEA region – division of a global corporation), their double loyalties give them some space to design and implement more flexible forms of organizational responses to local challenges. The second step has been made with the gradual – and by no means completed – transition from a hierarchic to a networked organization. Some researchers still think that we are currently dealing with hybrid forms of networks floating on hierarchies (Nohria and Eccles 1992). Flexibility has been increased by either reorganizing the internal cooperation between various parts of the same organization or by coordinating an organization's activities with other, independent organizations. In the former case, we are dealing with, for instance, a global corporation, which divides its components into separate profit centers, without, however, granting them the status of autonomous companies. In the latter case, we observe a company, which approaches other companies and outsources some activities to them. The level of outsourcing can vary considerably – some companies outsource many functions, keeping only the financial and inventive design departments, and some limit outsourcing only to very few functions – e.g., bookkeeping (in case of large global corporations based in the USA or in the northwestern Europe, the bookkeeping function is frequently outsourced to India or to central and eastern Europe). This split requires a choice between "core" functions, which are usually kept near the headquarters, and "outsourceable" functions, which can go abroad or to other companies.

These two dimensions of organizational flexibility, central-regional (linked by a matrix structure) and hierarchic-networked (linked by outsourcing contracts), have been viewed from the point of view of an organizational change consultant or from the point of view of a CEO of an organization. They try to preserve an overall view, a *vue d' ensemble* – so that they can think about core strategic decisions and avoid time loss on routine issues, which can be easily solved without them. From the point of an employee, down below the top management team level, the dimensions of organizational reality can look differently. A rigid hierarchy of jobs in a bureaucratic structure of a classical industrial and office organization made a calculation of one's upward mobility easy. The professional career has been supported by the collective bargaining power of the trade unions, which offered a possibility of a permanent employment. Both gave an employee, even if he or she had been subjected to a dehumanized managerial dictatorship of "the best and the brightest," a certain degree of stability. Flexibilities of an organization, however, had brought about an end to this stability and to a

relative certainty of a lifelong employment. If an organization can hire and fire at will, it becomes much more flexible than an organization, which cannot do so without inflicting punitive costs on itself. But how can you convince employees that it is in their best interest to give up their trade union defended status of holders of protected jobs and agree to be employed as temporary employees (temps) or as "precariat" (temps with no hopes for a permanent position and a looming danger of being fired at a short notice)? Well, you must convince them that they are proud and free professionals, itinerant entrepreneurs exchanging a lifelong career in a single organization for a sequence of creative jobs in different projects, organizations, and networks. Organizational man becomes a spider woman – usually depicted as an itinerant specialist in information and communication technology (ICT) wandering through the silicon valleys of high-tech clusters of the Western world (Johanson and Swigart 1995). The dimension of stable vs temporary job – stable being opposed to a temporary and subsequently to a precarious one – became very important with the cultural turn in the theories of professional management.

## Cultural Flexibility of Organizations

If tangible assets and privileges of an employee are eroding away, the usual ideological explanation is linked to a new technology. When containers arrived on Brooklyn waterfront, the predominantly Italian longshoremen could keep their disappearing jobs until they reached retirement age (diFazio 1995). But the employment books were closed, and container terminals built. Far less numerous container terminal crews arrived and the loss of blue collar jobs became irreversible. When computers made computer-aided design (CAD) and computer-aided manufacturing (CAM) possible, thus paving the way for industrial automation, the Japanese engineers incorporated best human practices of skilled workers into the software of industrial robots (a player piano principle), while the US designers built robots from the virtual scratch, disregarding accumulated expertise of skilled operators (Noble 1986) to undermine the power of the unionized workers. Powerful computers, online databases, and new technologies of information and communication also allowed to reduce middle class, white collar jobs, and the emergence of AirB2B or Uber signals the fragility of jobs in hospitality industry, tourist agencies, and hotel chains – in business company models in services, which were supposed to create new jobs for employees fired from manufacturing industrial jobs. Flexibility increases due to the emergence of new technologies, and permanent jobs disappear from new business models of a flexible organization. Technological explanation, however, is not enough.

Beginning with the manifesto of a business consultant Tom Peters "In Search of Excellence" (Peters and Waterman 1982), many researches focused on cultural software of the employees as the key to unleashing creative innovativeness of individuals. Creativity and innovativeness became cardinal virtues in a flexible organization fighting for a competitive advantage. Managerial targets do not get employees excited; values do, as the CEO of General Electric, Jack Welch, used to say, hence a new limelight for an organizational culture as one of the intangible assets helping top companies in evolutionary struggle against competitors. Cultural turn in theories of flexible organization and managerial models of organizational development and change owe much to the contribution of a Dutch industrial engineer turned social psychologist, Geert Hofstede, and to a social psychologist of organization turned a humanist theoretician of the sense-making processes – Karl Weick (1995). Hofstede (1980) and Hofstede et al. (2010) won an epochal battle against IBM to recover data he had collected when working for this global corporation with the US roots in the 1970s. Hofstede asked what made a difference detected in productivity levels if organizational forms were the same and so were the jobs in various national locations of the IBM plants. His answer was that the cultural software in local employee minds made the difference. He has analyzed his data and came up with a theory of the four (later, with Bond, five, currently, with Minkov, six) dimensions of national culture

(Minkov 2011). Each national culture was located on a different position along the axis of individualism opposed to collectivism, masculinity opposed to femininity, uncertainty avoidance opposed to a tolerance for risk and uncertainty, and low versus high power distance. Later, each national culture was also assigned a place along the axis of long-term versus short-term orientation and along the axis of indulgence versus restraint. Imposing a Hofstede's grid on a cultural software of any group of employees, a researcher could predict the limits of flexibility with respect to designed, implemented, or planned organizational formats. Hofstede's theoretical views had been both criticized and continued by the GLOBE research teams all over the world, which had resulted in an adaptation and adjustment of the model of cultural dimensions. However, further developments, of which the globalization (Wallerstein 2004) and the McDonaldization (Ritzer 1996) of business companies were cases in point, resulted in the relative demise of the model of national cultural differences and in its replacement. It was replaced either with a behavioral theory of economics or with a critical approach to flexible organizing (Parker et al. 2014; Magala 2009; Boje et al. 2012; Ybema and Bijlsma-Frankema 2007; Alvesson 2002). National cultures turned out to be less homogeneous than expected. New organizational forms, flexible and networked, global in range, and digital in communications shifted the balance of flexible organizing beyond nations. The shift has been noted as a transition from an iron cage of the social division of labor envisioned by Weber (2015) to the velvet cage of the flexible organizational forms, which allow for flexible working hours and nonconformist lifestyles, but isolate employees. Professional individualists become submerged in a filtered isolation of social media users, watching the screen of their iPads or iPhones as the ancient Greeks may have watched shadows on the wall of Plato's cave. Perfect employees of flexible organizations do not have to be ordered around because they have internalized corporate values and – as CEO of General Electric, Jack Welch, once claimed – believe in every one of them.

## Conclusion

The mainstream researchers in managerial sciences consider a flexible organization a necessary remedy against bureaucratic, hierarchic, vertical forms of organizing business activities. According to them, flexible organizational forms allow for an ongoing "revitalization" of organizing and management. Flexible organizations:

> can respond to a wide variety of changes in the competitive environment in an appropriate and timely way (Volberda 1996).

Researchers closer to critical management studies are skeptical about the postmodern forms of organization. They present empirical evidence that bureaucratic forms of organization are still expanding. Even global terrorist networks adopt bureaucratic management methods, while the frequency of the emergence of the post-bureaucratic, flexible organizations is still fairly modest and limited:

> The claim of rupture, of the real and inevitable abandonment of bureaucracy is an unrealized and unrealizable utopia/dystopia (Malizia et al. 2017).

# Focus Event and Public Policy

Christopher L. Atkinson
Department of Administration & Law, University of West Florida, Pensacola, FL, USA

## Synonyms

Crisis; Focusing events; Policy shocks; Triggering events

## Definition

A focus event or focusing event is an occurrence, typically exogenous, which emphasizes or highlights a challenge that seems to demand non-incremental public policy intervention, or catalyzes a previously vague understanding of a public problem, potentially highlighting a preferred path forward for policy intervention.

## Introduction

A focusing event (Throughout this entry, I refer to the term as "focusing events," consistent with a perceived preference in the literature.), also called a focus event or a triggering event, is an occurrence that can make government decision-makers aware of the existence of a problem. In the literature, the event is usually from outside the policy apparatus and its structures. It is a "push. . .like a crisis or disaster that comes along to call attention to the problem, a powerful symbol that catches on, or the personal experience of a policy maker" (Kingdon 2003, pp. 94–95). Essentially, the focusing event elevates "policy items from the unofficial or public agenda onto the government one" (Béland et al. 2018, p. 3). The focusing aspect rests in a concept's ability to "capture in a nutshell some sort of reality that people already sense in a vaguer, more diffuse way" (Kingdon 2003, pp. 97–98). The process of recognition is helped along if the focusing event is reinforced by a "preexisting perception of a problem," if the event acts as an early warning or if the event occurs in proximity to or in aggregation with other events (Kingdon 2003, p. 98). The event has a dramatic quality, which may lead to policy learning (Unlu et al. 2010). Michaels et al. (2006) suggest that a focusing event leads to policy change, "a detectable deviation from the purposive course of action that is in place to address a perceived societal problem" (p. 983).

What is considered by an individual or group to be a problem may not be identified in that respect by others. For an individual to identify an event as illustrious of a problem, impact, relevance, and

proximity are important; if others in the group have similarly defined the concern, a policy environment that had previously approached an issue in laissez faire style may be spurred into action, with media possibly assisting in framing the problem and potential solutions, and keeping pressure on authorities to respond (Wagner 2007). Birkland argued that "big events have important but variable influences on policy agendas," (2006, p. xiii), and as far as policy change based on individual events is concerned, "the accumulation of experience influences policy change; learning is cumulative" (2006, p. 153). Still, we cannot assume that improved policy results from experience and the presence of a disaster or focusing event, though a *catalytic*, catastrophic event (judged as number of people affected adversely, geographic extent of the harm caused, or extensive property damage) may result in particularly rapid change (Birkland 2006).

## Focusing Events in Theory

Focusing events are associated with garbage-can theory; participation is changeable, options are challenging, and technology is uncertain in a primordial soup of potential policy approaches and supposed solutions, waiting to be actualized (Cohen et al. 1972), depending on just the right focusing event and policy option to suit the situation. In garbage can theory, decision-making occurs in an environment that lacks rationality and is prone to meddling; notably, "the absence of a bottom-line or specific measures of costs and benefits of decisions provides a fertile breeding ground for political garbage" (Teasley III and Harrell 1996, p. 489). Focusing events can thus serve as a critical ingredient to cut through competing interests and options. Focusing events are also related to the multiple streams framework (MSF), where convergence of various factors yields a window of opportunity for policy advance and change (Robinson and Eller 2010), punctuated equilibrium theory, wherein incremental development of policy is interrupted by focusing events, which may release policy monopolies (Baumgartner and Jones 1993), and appear in work reliant on the advocacy coalition framework (ACF).

Research has focused on the difference between technological (man-made) hazards and hazards of a natural origin, and implications for policy change as a result of focusing events. Lindholm et al. (2015) found that technological events led to stronger reactions than natural events, and an event "with a stronger degree of focus brings about more emotional and cognitive reactions than an event with a weaker degree of focus, although only among events originating from man" (p. 407). Birkland (1996) suggested that natural disasters are subject to dramatic portrayal in the media, and yet, policy attention to them is minimal until an event occurs; this attention is sustained somewhat in the aftermath, and then quickly fades.

Because natural disasters readily gain attention not only of the general public but of elite groups that can directly impact policy processes, a natural disaster is often likely to become a focusing event. However, a focusing event does not necessarily mean that a problem will be solved through policy; problem definition is a key aspect, and how a problem is defined may actually limit the ability for policy processes and official structures to solve it. Media, for example, could undermine an event's potential through portrayal as an isolated occurrence out of context, or, from the opposite mindset, consider an event part of a progression of events out of their control. Existing narratives and ways of explaining may limit the ability of a focusing event to lead to productive policy change (Crow et al. 2017). Further, echoing Kingdon (2003), there is some evidence that an accumulation of focusing events may be more impactful for policy change than the occurrence of a rare event (O'Donovan 2017).

Through its coverage, the media often helps to decide what events will become focusing events and thus wields considerable power for policy purposes. The severity or scope of the event does not necessarily need to be large for the event to be considered a focusing event; this is especially true as policy choices are made at all

levels of government, and exogenous events can and do focus political and administrative actors on specific policy problems and potential solutions, throughout the range of government activity (Henstra 2010).

## Examples of Focusing Events in the Literature

Focusing events have been a common policy-related root in many recent works in the literature. The attacks of September 11, 2001, are considered a major focusing event, as are the 2004 Madrid train bombings. Others include the Challenger and Columbia space shuttle disasters, and the 1996 Port Arthur massacre; events may be tied to labeling, like fiasco and crisis (Boin et al. 2009). In terms of immigration policies, Dekker and Scholten examined focusing events related to the Dutch immigration experience and considered media effects and consonance of policy framing (2017). McCormick and Whitney (2013) identified the incidence of West Nile Virus in New York City in 1999 as a focusing event, helping to construct a crisis with ensuing need for response, but resulting in implications for how the public interacts with government agencies. An event need not be national or international in scope; the 2000 chemical cloud incident that affected Sarnia, Ontario, Canada, is an example. A policy entrepreneur might creatively connect streams within the multiple streams framework, with the idea of creating an environment for specific, desired change, using the media as a crucial persuasive tool to maximize the opportunity created by a focusing event (Henstra 2010).

## Limitations of Focusing Events as an Explanatory Concept

While focusing events may cause often be cited as the source of or rationale for change in a policy area, the existence of a focusing event does not always presuppose an attendant policy shift, or change in the viewpoints of actors or policy coalitions. Focusing event research has tended to be skewed toward implications for agenda-setting (Nohrstedt 2008). Organizational culture and cultural impact may have a critical role to play in whether a focusing event results in policy change; what constitutes a focusing event, in that a specific occurrence was important or momentous, is vaguely defined and often noted after the fact (Fowler et al. 2017). In hindsight, what is deemed to have been a focusing event in a particular construction of policy may have risen to that level or not, and this is largely a matter of opinion; some may agree an event has occurred, and others may deny it. Is the event itself important, because of the policy change that occurred, or is the change more important, with the focusing event serving as a justification when a host of variables contributed to the change? That events are required to fathom public problems and arrive at solutions is disquieting and speaks poorly of the policy process generally and the potential for policy learning specifically. In this view, public policy actors are reduced to running from crisis to crisis, only catching the occasional glimpse of problem and policy alignment when something horrible has happened – resistant to admitting the truth in front of them. This is a caricature, but there is perhaps some occasional truth in the portrayal.

A focusing event may involve people from outside the immediate policy system, as a result of the additional attention, but any reforms might be incremental instead of groundbreaking, as could be expected given a strong external shock (Boucher 2017). Even a focusing event that arouses significant fear in the population may not result in policy change, if the event occurs in an environment of complexity and inconsistency; instead of resulting in change, fear can further stoke a need for stability (Zahariadis 2015). The resultant policies may be more dependent in their construction and considerations on emotions than scientific fact (Atkinson 2014). In the Fukushima disaster case in Japan, for example, it is notable that dominant pronuclear power groups did not change their viewpoints, even after the event,

though the focusing event was catastrophic enough to provoke change (Watanabe 2016).

Hurricane Katrina, which struck the United States Gulf Coast in 2005 and caused great devastation, is often mentioned as a focusing event in the literature. However, it should be noted that many areas along the coast still suffer from the same vulnerabilities that existed prior to the storm; while some policy advance has been achieved, the area is far from resilient beyond a relative sense. As a focusing event, Katrina made a policy failure very clear, but subsequent storms and experiences may undermine Katrina's place as a focusing event spurring positive change – change has been limited rather than comprehensive, even given the gravity of the occurrence. Media coverage of the event focused on the distress of those displaced, death/illness, lawlessness, damage, and government failure (Dill and Wu 2009). These elements remain resonant with the experience of the storm and its aftermath. In terms of acting as a focusing event to prevent future disasters, there have been many more recent events that show little change in the ability of the system and people to more appropriately respond to known threats. The 2017 hurricane season was the costliest on record, but it is an open question whether hurricanes like Harvey, Irma, and Maria will be considered focusing events, resulting in positive change beyond incremental movement, or whether there are limits to the impact of such events on the policy process, and even a numbing of the collective mind through media's disaster drumbeat.

The focusing event may lay a groundwork for interaction, but as Unlu et al. (2010) noted in their review of the Turkish case, this does not necessarily force collaboration between various governmental and community groups. Incorrect assumptions are still made; certain approaches from above may halt the advance of local policy learning. Even if changes are adopted, it does not mean that these changes will be implemented and desired results realized (Sapat et al. 2011). As a specific concern related to Hurricane Katrina, there remain clear gaps between short-terms and long-term housing displacement in instances of hazard events, and this evidences real concern for the addressing of vulnerability (Levine et al. 2007). This illustrates that identification of a focusing event alone does not solve underlying problems, even if some positive change does occur.

Roberts (2009) correctly warned against relying too much on a focusing event to guide preparation for future incidents; events clearly differ in their pattern of devastation and connection to existing vulnerability and are thus context-based. This also raises the concern about preexisting narratives and expectations and how those may incorrectly guide planning and response. Béland et al. (2018) suggested that the MSF is overly simplistic, in that it is difficult to distinguish the streams from one another, as well as the difficulty inherent in analyzing the actual separation and joining of streams. This apprehension is directly relevant for focusing events. Aside from authors cleverly noting that a focusing event occurred and drawing attention to it in context of policy change, the specific variables that exist in the policy streams or in their nascent garbage stage are not easily drawn out.

## Conclusion

The concept of focusing events is undoubtedly useful; the invoking of a dramatic event, with all its problems and potential solutions, is captivating for the policy imagination. A great deal of this potential, and perhaps why the concept appears so widely in the literature, comes from the concept's apparent simplicity and ease of understanding. However, the worth of the concept from an analytical perspective is mixed; the simple existence and academic proclamation of a focusing event is not necessarily novel, and does not, on its own, fully explain a policy change. Future research may tend to include focusing events as part of a synthesizing of approaches along with other theoretical traditions in policy (Petridou 2014). The connection of MSF, garbage can modeling, or ACF theory can help, but the focusing event itself is only a small aspect of a multifaceted analytical problem. Issues of stability and fear can play a deciding role in undermining the potential effect

of a focusing event. In order to gain stronger understanding of what has occurred and why, attention must be paid to how people respond, sometimes quite differently, to a focusing event, and how they may not perceive it as an event at all.

## Synonyms

Food accessibility; Food availability; Food security; Food stability; Food utilization

## Definitions

Food security is defined in this entry as "having physical and economic access to sufficient, safe and nutritious food at all times, by all people in order to meet their dietary needs and food preferences for an active and healthy life" (FAO 1996: 2).

## Introduction

In 2010, it was estimated that over one billion people in the world lacked adequate amounts of nutritious food with enough macronutrients (protein, fat, and caloric content) and essential micronutrients, minerals, and vitamins (iron, vitamin A, and iodine) (Havas and Salman 2011). Close to a decade later, efforts to reduce this acute food security problem seem to have achieved very limited success. Current data indicates that the absolute number of people affected by undernourishment or chronic food deprivation in the world in 2017 was nearly 821 million. The situation is worsening in South America, and in most African regions it is even expected to escalate by 2030 because of global warming (FAO 2018). This entry discusses the key food security dimensions (availability, stability, accessibility, and utilization) and their complex determinants including: conflicts, climate change, macroeconomic trade imbalances between countries, natural resource constraints, human resource bases, weather conditions, gender balance issues, education, health, natural disasters, livestock ownership, farmland size, family labor, farm implements, employment opportunities, market access, level of technology application, crop disease, oxen ownership, and family sizes.

## Availability

Availability of appropriate and sufficient quantity of food among all people in a given society is a key dimension of food security. Food availability maybe achieved by locally producing food, imports or food aid. Any one of these methods that can be used to avail food to people is enhanced or constrained by different factors among individuals, households, communities and in different countries. For example climate, available land and its quality, availability of workers, their numbers, their technical and managerial skills, production tools and machinery used plus storage buildings and facilities may influence sufficient local food production. Other factors that may enhance or constrain food production include inputs such as water, fertilizers, animal feeds, plant and animal health, animal and crop disease prevention and control, integrated pest and weed management, cropping techniques, and animal and crop genetic improvement such as having in place short-cycle, drought-resistant varieties and disease-resistant varieties. The way producers are organized for instance as individual, cooperatives, groups, or contracted growers; the types of traders (collection, wholesale or retail); the marketing infrastructure such as roads, rail, air, and types of vehicles; storage, information systems, processing technologies, and retail structures (small shops, supermarkets or hypermarkets); and the level of competition at various stages of the value chain all influence the availability or lack of food to people among or within a country (Thomson and Metz 2000). It is such factors that in practical terms separate developed countries like Australia, Holland, or even single states like California in the USA that have all these described factors in their favor from third world countries like Malawi, Uganda, Burundi, and indeed the entire sub-Saharan Africa region where majority of the populations are still dependent on rain-fed

agriculture, using hand hoes to till the land for food production and losing most of it to pre- and postharvest handling problems. The analysis simply drawn from these factors is that food security is not about just having land, rain, and a bunch of people but rather involves a whole range of complex infrastructure that most countries still describe as third world must work upon. For countries like Singapore that have very limited space for food production or desert countries like the United Arab Emirates, Qatar, or Saudi Arabia, food availability can and indeed has been achieved by some through purchasing food on the world market, although this comes with a condition of a country having the money. Most of these countries are oil rich and food the case of Singapore, it is a wealthy high value manufacturing and services economy. Thus countries like Cuba, which experienced a blockade for decades, could not follow such a model; or Afghanistan who may find themselves with similar disadvantages as Saudi Arabia but without the oil or other sources of wealth have most of their people starving or dependent on food aid. Besides, it is very difficult to avail sufficient and nutritious food to large numbers of different people for a long time through food aid. Thus food aid as a model for food security is very unsustainable at least in the long term. But also depending on international trade for food availability comes with a lot of risks – for instance, price fluctuations on the world market, trade sanctions, or even country blockade as is happening to Qatar by Saudi Arabia, Egypt, UAE, and Bahrain can come with devastating consequences if it happened to a poor country. Qatar may be withstanding the pressure because, in fact, it is one of the wealthiest countries in the world. This cannot work for countries like Yemen, Eritrea, or Burundi, and even the ongoing example of Venezuela illustrates that even if a country has a lot of potential wealth creating resources such as oil, if government pursues wrong policies or has saboteurs, it can go bust and fail to feed its own people. But even when there is enough national food supply or availability, it cannot guarantee food access to an individual household unless that specific household has the means, resources, and purchasing power to access that supply. Thus enough supply (availability) of food to a population is a necessity but not a sufficient condition for food access. In other words, food availability at individual, household, community, country's region, or countries level does not necessarily mean that food security is also achieved at the other levels; for instance, many countries that are in a situation of national food security include some who people who do not eat sufficiently; a food-insecure household may also include some members who fully meet their food needs, and countries with a food insecure situations always have some population groups whose food needs are fulfilled (Thomson and Metz 2000).

## Accessibility

For food security to be practically achieved, food does not only need to be available in appropriate and sufficient qualities/quantities, it must also be accessible. Accessibility as dimension of food security involves many dimensions including people having the required resources (purchasing or production power) to acquire the food they need for a nutritionally adequate diet, proximity to markets or other distribution channels through which food may be acquired, and rights of access to the resources required to produce food or to receive it from others. In the same way, infrastructure – especially roads, ports, rail, water, and air transport that link producers to consumers (local, national or from the rest of the world) – also play a big role on food accessibility. Indeed, in the last 10–15 years, countries like Uganda, Kenya, Tanzania, and Ethiopia have committed a very significant proportion of their budgets on infrastructure building especially roads, electricity generation, ICT infrastructure, and building modern railway systems because these have a direct impact on agriculture, food production, and accessibility. At household level, several empirical studies have concluded that sex, age, income, and education of household head among other factors greatly influence food availability and accessibility of food security dimensions that in many instances reinforce each other. The age of

household head impacts on his or her labor supply for food production, and it has been noted that older household heads tend to be more food secure than the younger household heads (Arene and Anyaeji 2010). Female-headed households have higher dependency ratios that hinder household capacity to allocate labor to on-farm or other income-generating activities. In addition, female heads of households tend to be older and have fewer years of education than male heads of household (FAO 2012). The size of a household may also determine its food security status with bigger households having a higher probability of food insecurity because there is larger number of people to be taken care of by the same source of income. The more household heads engage in gainful employment or income generating activities, the higher their incomes that can in turn guarantee household food security. The income is expected to increase household's food production and access to more quantity and quality food. Education has also been noted to have positive influence on household food security. As the level of education increases, the percentage of food secure households increases because with increase in the level of education, individuals are be able to adopt more modern farm technologies on their farms thus improving their productivity and again have access to better job opportunities in the labor market. The larger the farm size of the household, the higher the expected level of food production. It is, therefore, expected of a household with a larger farm size to be more food secure than a household with a smaller farm size. However, if it is a large family with most members composed of dependent children and the elderly, then the outcomes on food production and food security maybe negative. The level of off-farm activity can also influence household food security, but this can either be positive or negative depending on the level and gains from the activity; for instance, engagement in an activity can bring in money thereby corroborating the food security situation of the household. On the other hand, if farmers spend more of their time on off-farm activities at the expense of working on their farm and particularly if the wage they earn does not commensurate with the foregone farm income, their food security situation could be worsened (Babatunde et al. 2007).

## Stability

Stability as a dimension of food security is concerned with both food production and food access. Several factors including private and public food stocks, financial services, and safety nets may contribute to food stability. Public or private food stocks have a key role to play in interseasonal and interannual stabilization of food supplies. The issue of whether or not to hold strategic public food stocks has been the subject of a great deal of controversy. Even though they may be expensive to keep in terms of physical loss of goods, maintenance, and funding, stocks are among the few instruments that the state can use to intervene in food markets and to influence prices, either by releasing some part on the markets (which contributes to bring down prices) or by using them to supply safety nets. Private stocks, which generally contribute mainly to a better distribution of supply throughout the year, are profitable to hold only if there is sufficient difference between the price at time of harvest and that observed during the lean season (FAO 2000). In a country such as Uganda, the government should urgently invest and put in place infrastructure such as silos to stock surplus food production, especially cereals such as maize, not only to help farmers to keep their produce safely but also to stabilize prices and enhance food security which is not the case at the moment. At the moment, Uganda produces around five million tons of maize every year but consumes around half its production. The rest is being exported to neighboring Kenya, Rwanda, and South Sudan. South Sudan imploded in 2013 and most of its population lives as refugees in other countries including Uganda. Kenya and Rwanda had a bumper harvest in 2018 because of good rains, thus cannot import Uganda's maize. This has resulted in a sharp drop for maize prices from UgShs 900 per Kg to UgShs 200 per Kg, leaving farmers even unable to recoup the money they invested in and may be unable to raise money

to plan for the next seasons. The Minister of Finance, Hon. Matia Kasaija, declared that government of Uganda injected Shs100 billion to buy off excess maize stock that has resulted into falling corn prices in August 2018 and that those funds would be accessible to all interested traders in the maize business who have requisite storage, cleaning, and drying facilities in order to allow the maize to be stored for at least six months when prices are expected to recover. However, many commentators have previously and still argue that the solution for such problems that will most likely be a common occurrence is to build storage and processing plants that are sustainable (Onyango-Obbo 2018). Affordable financial services can also help to finance storage costs in the form of supplying funds to construct individual storage facilities, large-scale commercial storage, community bonded warehousing, and insurance in case of an economic or natural shock. The cost of commercial loans in most countries in the East African region, but especially Uganda, is very prohibitive; and, even in many cases, loans are not there altogether. When the governments privatized commercial banks, the main argument was that private sector led banking would lead to reduced interest rates on loans especially to farmers which has not happened. It is high time that the government started its own banks or a fund to address issues of financing farmers especially those in the subsistence category because that is where majority of the population is bundled, and it is also where food security problems are acute.

## Crop Diseases and Climate Change

Meanwhile, as these countries are struggling with low prices just because of one year bump harvest, one must not forget that for the last 5–7 years these countries have seriously suffered with crop diseases especially a devastating bacterial banana wilt disease that left many banana crops destroyed in Uganda, parts of DRC, Rwanda, Tanzania, and Burundi. In addition to the crop diseases, there has also been the dangerous fall of armyworm pest that originated from South America and devastated cereal crops, especially maize, leaving losses in billions of dollars in Southern, East, and West Africa. Meanwhile, this impossible-to-eradicate, dreaded worm has been reported in parts of India and Southern China, countries with huge population and big maize producers, and is on the march to Europe (Farmer 2018). Changes in the global climate system with more frequent hurricanes, storms, heavy flooding, and prolonged droughts have escalated in recent years leaving behind a huge trail of devastation in countries starting from the USA, Nicaragua, India, Indonesia, Vietnam, Thailand, Ethiopia, Philippines, China, Kenya, Afghanistan, and Sahel countries of West Africa among others, all experiencing heavy flooding or droughts in 2018. The impact of climate change on food security is overwhelmingly devastating on all dimensions of food security (food availability, access, utilization, and stability) as well as reinforcing other underlying causes of malnutrition related to child care, feeding, health services, and environmental health, especially among poorer countries and poor households (FAO 2018).

## Conflicts

Looking at what is going on in Yemen, South Sudan, Northern Nigeria, Democratic Republic of Congo, Libya, Burundi, Central African Republic, Somalia, Afghanistan, and other previously destroyed countries like Uganda and Iraq, it is not hard to know that conflict, whether it is a civil war or an invasion, leaves lives shuttered and food security systems destroyed. For instance, in Yemen, both warring sides have been reported to have committed severe war crimes, blocking ports and closing the airport, thus making it impossible for food aid and humanitarian support to come in, leaving millions in severe malnutrition status especially women and children. Similar outcomes are in DRC and South Sudan, Somalia, where it is almost impossible to access food to war victims because the warring groups are too aggressive to anyone. Even for refugees that fled to other countries, their food and nutritional needs are not properly satisfied in Camps. For example, Uganda

hosts over 1.4 million refugees with south Sudanese refugees estimated at over 1 million plus. Each refugee living in a settlement in Uganda receive 12 kg of maize, 12 kg of beans, and salt per month which is not enough food by any standard. But even with this meager food, aid agencies are struggling to support them given the fact that major donor countries such as Germany, the USA, Sweden, and EU have their own immigration issues to deal with especially refugees from Syria and West and North African countries whom they would want to limit from entering Europe. Apart from refugees, even host countries suffer. Before the war broke out in South Sudan in 2013, it was Uganda's biggest trade partner with Uganda earning over US$800 million per year in trade. When war broke out, all this trade collapsed with devastating consequences on Ugandan traders, farmers, and government revenues, all of which directly or indirectly affects food security at individual, household, and country level. The same scenario has happened to countries like Lebanon, Turkey, and Jordan that neighbor Syria.

## Utilization

The concept of utilization as a dimension of food security relates to the conditions, which ensure that once food has been consumed the body efficiently converts it into energy, growth, and good health. The capacity of the body to make full use of food is very sensitive to disease, affecting the digestive system and food nutritional quality. It has been proven that bacterial and parasitic diseases, including diarrhea and intestinal worms, are important causes of food insecurity even when adequate quantities of food are eaten. Diseases that affect the digestive system can be best mitigated by good sanitation and hygiene, drinking safe water, proper disposal of human waste, and availability of health services. Infrastructure that provides access to quality drinking water, along with sanitation, plays a critical role in the cleanliness of the environment in which people live, particularly so in urban areas (Uthman and Aremu 2008). Tuberculosis, HIV/AIDS, and malaria also impact on food security both at the phase of assimilation of food elements and on the working capacity of affected populations, determining their capacity to earn a living that will allow them to have access to food or to produce food if they are engaged in farming. Thus health services that can manage disease prevention and act rapidly in case of disease are also a key factor of food security (Alex 2003). Food nutritional quality is highly influenced by nutritional balance and diversity of a diet in terms of nutrient content (carbohydrates, fats, and protein), vitamins and trace elements, food hygiene, and safety standards. Balanced food diets also have implications for the physical and mental growth of children, maternal health including the health of unborn babies, and working capacity of people. It also has an impact on health (emaciation, obesity, resistance to diseases, and prevalence of cardiovascular diseases among others). It has been proven that a shortage of vitamins and certain micronutrients is obstacle to proper mental and physiological development, weakens the immune system, generates handicaps at birth, and leads to a life in which the full physical and intellectual potential of an individual is never achieved (Conceição et al. 2010).

## Safety Nets

Safety nets are another mechanism through which food security may be ensured. There are three main types of safety nets (sometimes referred to as social protection measures): food distribution, cash transfers, and subsidies. Safety nets entail transfer of resources toward beneficiaries to ensure that they can have adequate access to food. Eligibility to benefit from safety nets may relate to the economic and social characteristics of beneficiaries (target groups) or to the situation within which a country or region of the country finds itself (e.g., emergencies triggered by soaring food prices, drought, flood, earthquake). Access to safety nets can also be subject to conditions (for instance participation of children in an education or health program). Cash transfers and subsidies

can be financed by the state budget, private sources, or external aid. Safety nets in kind can be supplied from three main sources: existing private or public stocks, imports, or food aid in kind. Food can be channeled through special distribution programs, dedicated shops or selling points, or through existing private shops. State financed school meals programs offer another means for food transfers (FAO 2007). While the model of safety nets sounds plausible, experience has also shown that relying on it can come with very dangerous risks. For example, when Al Shabab terrorist attacked Kenya and massacred people in the West Gate mall in Nairobi, the Kenyan government retaliated by expatriating Somali refugees back to Somalia and closed down their money transfer and remittances platform because it suspected that the terrorists were using this platform to transfer money to carry out activities that harmed its people. Thus all of a sudden, Somalians found that the channel through which they received their livelihood support from their diaspora comrades was blocked. The most recent and worst examples is the scrapping of the US$350 million support to the Palestinians by the US President Trump administration which is expected to leave millions of Palestinians without enough food. Israel has also time and again blocked funds supposed to be handed over to Palestinians affecting their food security. Thus while the safety net approach especially made by those who believe in aid sounds good, it may be unsustainable or risky when relationships between the giver and receiver are not going well.

## Income Diversification

Food security can also be greatly determined by diversifying income sources away from agriculture. Increased incomes by people mainly engaged in nonagricultural activities can go a long way in securing food security. Income from nonagricultural activities can come from more diversified activities such as services and government, primary activities other than agriculture (like mining), and industrial activities, and is linked overwhelmingly to the multiplier effects of agriculture, through products, inputs, and consumption. These activities are in part also linked to agriculture through inputs (services, production and marketing of inputs, and production and maintenance of agricultural equipment). Income can also be earned from activities resulting from the consumption effect, i.e., activities due to consumption by people living from agriculture. Finally, income in rural areas may also come from sectors that have their own dynamics and are largely independent from agriculture: mining, manufactures, and tourism. All this non-agricultural income is very important among rural and urban workers involved in off-farm activities. In towns, income is mostly of non-agricultural origin, although some people may depend indirectly on agriculture, particularly through their role in agricultural value chains. A small portion may also come directly from agriculture, from peri-urban agriculture, from the use of land located at some distance from the city, from renting out land, or from transfer of resources by relations living in rural areas. Urban income and the employment in urban areas that generates them, whether in the formal or informal sector, will play an increasing role in food security in the future, as world population becomes more urban and the number of persons living in cities who may find themselves in a situation of food insecurity grows. One can safely bet, when addressing food insecurity issues, that this evolution will progressively move the focus of attention from agriculture and rural development toward economic development and income generation in urban areas. This implies that most of the policies for improving access to food will be policies aimed at reducing poverty in urban or suburban areas.

## Conclusion

All in all, it can be concluded that food security is achievable and has actually been achieved in many countries. Some countries in developed world are actually struggling with too much

food; while in poor countries, malnutrition is a big issue. The key conclusions drawn from this discussion are that there should be intensive and massive government intervention in the agricultural sector and sectors that directly influence agriculture like education, infrastructure, the environment, and trade. It is also important for the private sector and households to do their part by increasing their productivity through modern farming, family planning, education, and savings among others.

# Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable

Raymond Saner and Li-Chia Yiu
Centre for socio-economic development, Geneva, Switzerland

## Synonyms

Absence of binding international agreement regulating migrant labor on fishing ships; Insufficient control of trawler ships; Migrant labor on fishing ships; Modern slavery; Violation of basic human and labor rights

## Definition

Ships using migrant labor are not supervised nor sanctioned in case of violation of human rights of migrant fisherman. International governance system lacks binding regulation and sanction power providing loop holes which can lead to severe human rights abuses by unscrupulous owners of fishing ships.

## Introduction

This article focuses on a very problematic aspect of migration, namely, forced labor of migrants held captive on fishing ships which is a well-known violation of human and labor rights, but despite efforts made by human rights defenders and international organizations, the abusive and sometimes violent treatment of migrant-fishermen continues.

What has not been sufficiently researched nor discussed are the extreme forms of labor conditions that some migrants have to accept and cope with at times at the risk of their own survival. Such high-risk and inhumane working conditions exist on some fishing boats where migrant workers are kept in captivity and forced to live and work in conditions which lack basic standards of decent work and often result in serious human rights abuses.

As stated by the FAO (2017):

> Pressures to reduce costs and maintain or increase profitability are also growing, which increases the incentives to use cheaper labour and neglect social and ethical considerations in the work and life of fish workers, their families and communities. As a result, the use of migrant workers working in sub-optimal conditions on board fishing vessels and in processing plants has increased, facilitated by illegal networks of brokers. (p.1)

Hence, this article follows the call's suggestion to analyze "policy-level issues associated with the management of migration including labor-market issues and questions relating to business policy and strategy" and apply this to the precarious working conditions of migrant workers on fishing boats especially the long journey ships.

## Approach Used for this Research

Following the call's suggested approach for multiple levels of analysis consisting of micro, meso, and macro-levels, the authors close their analysis by adding a meta-level which consists of the larger international context within which fishing boats operate that are covered by international agreement and sector-specific rules following the example given in the field of philanthropic organizations operating in the educational sector in developing countries (Saner and Yiu (2019)).

The multiple-level approach chosen starts with a narration of case examples of human rights abuses on fishing boats in the South East Asian see (micro) and subsequently builds on the levels within which the case examples are embedded in namely the fishing owners and labour intermediaries (meso), their surveillance or lack of by port authorities and governments responsible for shipping fleets (macro) and ends with the discussion of international treaties (meta) and agreements which should have a bearing on the fleet owners, skippers and governments importing and exporting seafood products.

The detailed case examples below build on other case examples which have identified the lack of management responsibility and often colluding behaviors and attitudes of government officials who abdicate their responsibilities. A case in point here is the article published by the Academy of Management Discovery (AOD) authored by Gail Whiteman and Cooper (2016) which describes the dangerous conditions workers have to live with in the tropical forest of Guyana. The authors report a longitudinal study of a Malaysian forestry firm's operations in Guyana, South America, and show how certification and corporate social irresponsibility – in this case, the rape of girls and women – may jointly arise from a systematic decoupling of actors that collectively enabled irresponsible behavior (p.1).

Abuse of migrant workers on fishing boat bears also resemblance to human trafficking where young girls and boys are abducted to forcefully

serve as prostitutes in brothels or work in unhealthy and demeaning sweat shops exposed to violence by the criminal gang leaders and his staff. Human trafficking is equally understudied and underreported like the case of migrant workers being held captive workers on fishing ships. Analysis of human trafficking shows a similar lack of reported data and lack of monitoring by authorities who either collect corruption money or directly demand illegal commissions (Saner, Yiu and Rush, (2018)).

What follows is a graphical overview of the levels of analysis which will be applied to the study of migrant worker's captive working conditions characterized by inhumane treatment and violation of human rights (Fig. 1).

Subsequent levels of analysis will be meso (fishing boat owners and commercial counterparts), macro (relations between surveillance authorities such a port authorities and ministries of maritime affairs), and finally meta (international agreement on fishing rights and obligations and international labor regulations agreed by states who are also held responsible for implementing these international agreements).

## Micro-Level

Two centuries after the abolition of the transatlantic slave trade, at least 20.9 million people continue to work under coercion, largely in the informal and illegal economy (ILO global estimates 2012). This represents about 3 in every 1000 of today's world population. About 68 percent of today's forced labor is extracted by private agents, primarily in labor-intensive industries such as manufacturing, fishing, agriculture and food processing, domestic work, and construction.

According to the ILO's Forced Labour Convention No. 29, forced or compulsory labor is all work or service which is exacted from any person under the threat of a penalty and for which the person has not offered himself or herself voluntarily. It can occur where work is forced upon people by state authorities, by private enterprises, or by individuals (ILO 2015) (Fig. 2).

A string of recent reports by the ILO (2020) indicates that:

> ..forced labour and human trafficking in the fisheries sector are a severe problem. These reports suggest that fishers, many of them migrant workers, are

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Fig. 1** Four-level analysis adapted from Saner and Yiu 2019

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Fig. 2** Micro-level analysis adapted from Saner and Yiu 2019

> vulnerable to severe forms of human rights abuse on board fishing vessels. Migrant workers in particular are vulnerable to being deceived and coerced by brokers and recruitment agencies and forced to work on board vessels under the threat of force or by means of debt bondage.
>
> Victims describe illness, physical injury, psychological and sexual abuse, deaths of crewmates, and their vulnerability on board vessels in remote locations of the sea for months and years at a time. Fishers are forced to work for long hours at very low pay, and the work is intense, hazardous and difficult. Capture fisheries have one of the highest occupational fatality rates in the world.

The ILO report also indicates that "recent trends within the fisheries sector, such as overfishing, illegal fishing, and a shift in sourcing the workforce from high-income to middle- and low-income countries mean that more relatively low-cost migrant workers are employed by the fisheries sector. Lack of training, inadequate language skills, and lack of enforcement of safety and labor standards make these fishers – particularly migrant workers – vulnerable to forced labor and human trafficking."

According to Nakamura et al. (2018), at least 260 million people depend on seafood work (some estimates are 800 million), and the sector is possibly the world's largest employer. Sixty-five percent to 70% of seafood for export markets is produced in developing countries where labor costs are relatively low. For the rural poor, increasing work opportunities in distant water fleets, aquaculture areas, and processing hubs offset decreasing local opportunities for seafood work, but this may require migration and dependence on labor brokers. Seafood is made with a significant incidence of forced labor, child labor, or forced child labor in the seafood hub countries of Indonesia, Thailand, Vietnam, the Philippines, and Peru. In 2016, widespread forced labor in seafood work was reported in 47 countries, with incidents reported in additional countries, including New Zealand, Ireland, the United States, and Taiwan.

While the normative framework and tracking of country-level findings are largely in place, companies lack mechanisms to collect the human-scale data needed for identifying and remediating forced labor risks inside their supply chain. The challenges are numerous. First, the nature of fishing work is fundamentally different from other labor-intensive industries, and these differences can mask workers' voluntary or

involuntary status. Fishing vessels operate remotely and are physically isolated. Working hours are determined by ocean conditions and the around-the-clock duties needed to keep the vessel operating safely. Payment for work most frequently is a share of the catch value based on seniority (Nakamura et al. 2018).

The International Union of Food, Agricultural, Hotel, Restaurant, Catering, Tobacco and Allied Workers' Associations (IUF) is monitoring the SE Asian fishery sector and reports lots of cases of forced labor of migrant workers on fishing ships and also in other parts of the world like Africa. The most recent stories are available on the following website: http://www.iuf.org/show.php?lang=en&tid=283.

Staff of another NGO called Environmental Justice Foundation (EJF 2020a) report widespread abuse and illegal fishing of some of the Taiwan fleet stating:

> *Violent abuse of migrant workers and flagrant illegal fishing are systemic problems across Taiwan's distant water fishing fleet, a survey conducted by EJF of crew from 62 vessels has found. Crew from 24% of the vessels reported physical abuse and 92% reported having their wages withheld. Sharks were finned and bodies discarded on half of the vessels. Many migrant fishers are trafficked onto vessels and once out at sea, far from authorities, they are subjected to a kind of hell. Investigations by the Environmental Justice Foundation have uncovered cases of slavery, debt bondage, insufficient food and water, squalid living conditions, physical and sexual assault and even murder aboard fishing vessels from all over the world.*

EJF staff interviewed 71 former Indonesian fishers between August 2018 and November 2019 who had worked on 62 Taiwanese vessels (EJF 2020b). Workers from nearly a quarter (24%) of the vessels reported violent physical abuse, mostly being kicked and beaten by the captain or senior crew. One man, Supri from Indonesia, was locked in a freezer by the captain while he was still wet from the shower. "It was so cold inside. He did it on purpose. I shouted 'Captain! Captain!' Begging him to open [the door]. I kicked at it, but still he kept it locked. I was afraid, afraid of death. If I die, who will take care of my kid and my wife?" On the same trip, Supri was electrocuted with a stun gun by a fellow crew member under orders from the captain. The tool is used to kill fish, and the shocks left Supri weak and in pain.

## Meso-Level

According to the ILO 2020 report, strong indicators exist that forced labor in the fisheries sector is frequently linked to other forms of transnational organized fisheries crime. The term "fisheries crime" recently appeared in the context of emerging practical responses against offences committed within the fisheries sector.

The report continues stating that (Fig. 3):

> offences include severe cases of illegal fishing, related offences from document fraud, corruption and tax evasion but also human trafficking in the fisheries sector. Fisheries crime threatens marine ecosystems and has consequences for fish stocks. It has an impact on food security and sustainable fishing by coastal communities around the world. It also deeply affects human lives when it entails forced labour of trafficked fishermen.

EJF (2020b) reports that a Chinese-owned trawler has been relicensed to fish in Ghana, despite being caught for illegal fishing twice and failing to pay its fine. In June 2019, the *Lu Rong Yuan Yu 956* was apprehended in Ghanaian waters with illegal nets and undersized "small pelagic" fish on board – the staple catch of canoe fishers. The full fine of US$ one million was issued, but the vessel owners refused to pay: in May 2020, the vessel was caught again for almost identical offences. Despite this clear track record of illegality, the vessel has now been licensed to fish again while it awaits a further hearing.

West Africa has seen an influx of vessels from China in recent months, including into Ghana, Senegal, and Liberia. In Ghana, around 90% of Ghana's industrial fishing fleet is linked to Chinese ownership, while in Sierra Leone, this figure stands at 75% of industrial vessels. New vessels continue to arrive in Ghana from China in spite of a government moratorium on the issuance of new licenses in place since 2012.

EJF staff concluded that ultimately, no one wins if we exploit our oceans to the point where

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Fig. 3** Meso-level analysis adapted from Saner and Yiu (2019)

fish populations collapse. To safeguard both marine ecosystems and the livelihoods of fishers, China and Ghana must work together to prevent cases like this from happening again? All cases of illegal fishing in Ghana must be treated rigorously, with sanctions severe enough to be deterrent and full transparency regarding how the process is conducted. Eradicating illegal fishing is eminently achievable and benefits us all.

Another NGO called Sea Junction (2020) active in the field of labor abuse in the fishing sector reports that "when the fishing boats and trawlers returned to land after 3 to 4 weeks of fishing, they transferred the migrant workers to boats that were outbound on their way out at mid-sea. These transfers ensured that the migrants would not be able to set foot on land, resulting in their time on these boats measured in years."

Following these reports and the work of other NGOs supported by the International Organization for Migration (IOM), regulatory measures have been put in place by the governments of Indonesia and Thailand, and the industry and practices have improved. The EU has also cooperated by "yellow carding" supermarket chains in Europe that did not have adequate measures of due diligence in place to monitor compliances with regard to sourcing and processing.

But the industry has adapted by moving further across the oceans to places like Madagascar and the African coast where poverty and misery can still be exploited without consequences.

## Macro-Level

Human trafficking and HR abuses of migrants working on the often illegal fishing ships can occur because of corrupt practices of port authorities and government officials in charge of maritime matters (Fig. 4).

> The IOM mission in Indonesia provides a glimpse into a far-reaching and well-entrenched criminal industry operating alongside the legitimate fishing industry, and often overlapping it. The situation represents the spread of transnational organized crime at sea and the threat it poses as a maritime security threat to nations, and a human security threat to fishers, seafarers and fishing communities.

*Mark Getchell* Chief of Mission IOM Indonesia wrote in the foreword to the study:

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Fig. 4** Macro-level analysis adapted from Saner and Yiu (2019)

- *It is my hope that this report can serve as a catalyst for governments, non- government organizations, the private sector and consumers alike to take concerted action against human trafficking in the fishing industry. The human trafficking cases documented in Benin and Ambon, while quite significant, still only represent one small snapshot of the much larger global exploitation and abuse of fishers. It is the scale of this exploitation that demands broad collaboration in order to effectively combat it.*

*As reported in their publication IOM funded research, the Indonesian fishing industry is characterized by many shortcomings. What follows is an extensive citation of their findings which are not only succinct but also relevant for other countries exposed to IUU criminal fishing practices and HR abuse of migrant fishermen.*

- *systematic and highly organized deceptive recruitment and exploitation of fishers and seafarers from multiple source countries in South East Asia;*
- *witness testimony of murder and the unlawful disposal of corpses;*
- *extreme cases of labour exploitation with fishers working in excess of 20 Hours per day up to 7 days per week; and,*
- *a lack of awareness at the local level of human trafficking and forced Labor and associated criminal activity.*

*IUU fishing in Indonesia is characterized by:*

- *overlapping Indonesian government legislation and regulations has created confusion over the responsibilities of key government bodies responsible for the oversight of worker recruitment, conditions, and monitoring of fishing companies, manning agencies, and fishing vessels;*
- *collaboration of more than 2 people: double-flagged vessels are registered in two different countries. This act of forging the deletion certificate is done by at least the ship-owner, the backers and field actors;*
- *suspected commission of serious criminal offences: illegal fishers violate numerous laws, from deactivating the transmitter, using*

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Fig. 5** Meta-level analysis adapted from Saner and Yiu (2019)

*prohibited and destructive fishing gear, illegal transshipment, forging vessel documents and the logbook;*

- *Foreign masters working illegally for indefinite periods of time: although there has been a national law prohibiting the use of foreign crews, there are still lots of foreign fishing masters working on board vessels undertaking lengthy voyages. This shows that there is considerable planning to conduct the crime;*
- *the pursuit of profit and/or power: the very reason for fisheries crime is to gain more profit and financial benefits with the least minimum effort in regards to compliance and exploiting the corruptible tendencies of some high level authorities and politicians;*
- *operating at an international level: illegal fishers operate in multiple countries, fish in various areas, fly flags of convenience and land their catch directly to another State, and sell the fish in the international market at high cost; and,*
- *using commercial or business-like structures: most illegal fishing operations are managed using large companies, often established with foreign investment, have valid licences, yet they are violating laws and evading taxes.*

## Meta-Level

The analysis of this last level presents and discusses international agreements which consist of guiding principles that the international community has agreed to follow and which can provide guidance for governments and businesses involved in the fishing industry as to what they should do to combat inhumane working conditions on fishing ships (Fig. 5).

A) Sustainable Development Goals (SDGs)

Two of the 17 goals of the 2030 Agenda are related to sustainable oceans and decent working conditions. They are cited in full including the indicators which have been drafted for measuring the countries' achievement of the respective goals and targets. Some of the texts of the targets and indicators relate to the fishing sector and work conditions (Table 1).

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Table 1** Targets of two SDG goals and indicators

| **SDG 14: Conserve and sustainably use the oceans, seas, and marine resources for sustainable development** | **Indicators** |
|---|---|
| Target 14.c enhance the conservation and sustainable use of oceans and their resources by implementing international law as reflected in the United Nations convention on the law of the sea, which provides the legal framework for the conservation and sustainable use of oceans and their resources, as recalled in paragraph 158 of "the future we want" | 14.c.1 number of countries making progress in ratifying, accepting, and implementing, through legal, policy, and institutional frameworks, ocean-related instruments that implement international law, as reflected in the United Nations convention on the law of the sea, for the conservation and sustainable use of the oceans and their resources |
| Target 14.4 **By 2020, effectively regulate harvesting and end overfishing; illegal, unreported, and unregulated fishing; and destructive fishing practices** and implement science-based management plans, in order to restore fish stocks in the shortest time feasible, at least to levels that can produce maximum sustainable yield as determined by their biological characteristics | 14.4.1 proportion of fish stocks within biologically sustainable levels |
| **Goal 8. Promote sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work for all** | |
| Target 8.7 take immediate and effective measures to eradicate forced labor, end modern slavery and human trafficking, and secure the prohibition and elimination of the worst forms of child labor, including recruitment and use of child soldiers, and by 2025 end child labor in all its forms | 8.7.1 proportion and number of children aged 5–17 years engaged in child labor, by sex and age |
| Target 8.8 protect labor rights and promote safe and secure working environments for all workers, including migrant workers, in particular women migrants, and those in precarious employment | 8.8.1 fatal and nonfatal occupational injuries per 100,000 workers, by sex and migrant status<br>8.8.2 level of national compliance with labor rights (freedom of association and collective bargaining) based on International Labour Organization (ILO) textual sources and national legislation, by sex and migrant status |

**Assessment**

The two goals and indicators listed do only minimally relate to the fishing industry and the working conditions on fishing ships be that for local or migrant workers.

B) International Agreements

The United Nations Convention on the Law of the Sea, 1982, provides in Article 94(3) that "[e]very State shall take such measures for ships flying its flag as are necessary to ensure safety at sea with regard, inter alia, to: . . . (b) the manning of ships, labour conditions and the training of crews, taking into account the applicable international instruments" (ILO 2017, p.17).

**Assessment**

The Convention of the Law of the Sea identifies what countries should do to ensure safety and related conditions. It is a constructive treaty but not all UN member countries have signed it.

C) FAO

The 2017 Fishing Industry is an important domain of FAO's mandate. The executive summary of the FAO 16th session on social sustainability in fisheries value chains and link to fish trade lists two international guidelines that are relevant, namely (Table 2):

The FAO document closes with the following two recommendations:

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Table 2** FAO guidelines

| | |
|---|---|
| FAO voluntary guidelines for securing sustainable small-scale fisheries (SSF guidelines), 2014 | Human rights-based approaches. Promotion of social development, employment, and decent work: Elimination of child and forced labor; occupational safety and health; adequate standards of living; value chain, postharvest, and trade: Fair distribution of benefits, participation of small-scale actors in decision-making |
| OECD-FAO Guidance for Responsible Agricultural Supply Chains, 2016 | Responsible business conduct, due diligence, supply chain approach, risk management (the guidance document specifically excludes fisheries and forestry sectors) |

www.fao.org/3/a-i4356e.pdf
www.oecd.org/daf/inv/investment-policy/rbc-agriculture-supply-chains.htm

- *Share information and experiences on social sustainability efforts in fish value chains.*
- *Provide guidance for future FAO work in the area of social sustainability in fish value chains.*

The 2019 corollary FAO document calls for cooperation toward a socially responsible fish value chain consisting of the following: a) a socially responsible fisheries and aquaculture value chain is achieved when the private sector, governments, civil society, the United Nations system, and other actors cooperate between them, all together, toward an effective implementation of human rights, and b) the scale and ambition of the results associated with this guidance are based on working in a spirit of solidarity, in particular solidarity with vulnerable actors and communities, small-scale fishers, indigenous peoples, and ethnic minorities.

**Forced Labor of Migrant Workers on Fishing Ships: Holding Management and Governments Accountable, Table 3** ILO conventions on working conditions on fishing ships

| | |
|---|---|
| International Labour Organization (ILO) Declaration on Fundamental Principles and Rights at Work, 1998 | Freedom of association, the right to collective bargaining, abolition of child labor, forced labor, and discrimination |
| ILO work in fishing convention C188, 2007 | Working and living conditions on board fishing vessels |
| ILO 2014 Protocol to the Forced Labour Convention, 1930 (P029) | Fight, prevent, and deter modern-day slavery |

www.ilo.org/declaration/lang%2D%2Den/index.htm
www.ilo.org/global/about-the-ilo/newsroom/news/WCMS_535063/lang%2D%2Den/index.htm
www.ilo.org/dyn/normlex/en/f?p=NORMLEXPUB:12100:0::NO::P12100_ILO_CODE:P029 www.ilo.org/wcmsp5/groups/public/@ed_norm/@declaration/documents/publication/wcms_321414.pdf

### Assessment

Both FAO documents offer valid guidelines on how to improve abusive HR conditions of and working conditions on fishing ships. However, they are suggestions and not a binding agreement.

D) ILO

The following declarations and conventions are relevant for the working conditions on fishing ships (Table 3):

> *Key sections of ILO's conventions:*
>
> *The competent authority or authorities responsible for the Inspection of working and living conditions on board fishing vessels should clarify the responsibilities of fishing vessel owners, skippers and fishers in national laws, regulations or other measures implementing Convention No. 188. (*ILO 2017*, p. 19).*

In June 2007, the International Labour Conference voted overwhelmingly in favor of adopting the Work in Fishing Convention, 2007 (No. 188), and the accompanying Work in Fishing Recommendation, 2007 (No. 199). The Convention will enter into force in November 2017, as it has received the required ten ratifications (ILO 2017, preface).

**Assessment**

The ILO conventions and declaration are very industry-specific and useful as guidelines for governments, labor unions, and businesses. However, they are only binding for countries that have signed them, and even for those who signed those, violation of responsibilities is not severe.

E) Consumer NGOs and Business Alliances

Marschke and Vadergeest (2016) write that insights from research on regional labor migration as well as the work of civil society organizations in Thailand suggest that broader improvements in labor relations will require changes in migration management, with a focus on addressing vulnerabilities that restrict the abilities of migrant workers to obtain better working conditions.

They also state that the scandals about slave labor of the industrial fisheries have revealed not only the connections between northern buyers and southern labor practices but also the relative lack of research on fisheries labor in Asia and the global south.

The authors offer several responses to the fisheries labour scandal such as anti-trafficking measures based on making governments put in place anti-trafficking laws and regulations; enforcement of IUU measures e.g. following the example of the EU and its restriction of imports of sea fool produce by fisheries hat are labelled as illegal, unreported and unregulated; government actions to limit labour abuse resulting from combined pressure of importing governments and seafood buyers as was the case with the Thai government who reacted by asking its navy to inspect labour conditions on fishing ships; and buyer supply chain requirements brought about by large scale buyers working to ensure that their seafood suppliers are not using trafficked, abused or underage workers.

The authors cite examples of major buyers (Marks and Spencer, Sainsbury's, Waymart, and TESCP) cooperating with local Thai NGOs engaging in a pilot project where migrant workers can call a local hotline to raise complaints of abusive labor conditions on their ship requesting remedial action.

**Assessment**

These alliances between seafood importing companies and local NGOs are novel and useful but are not stable. Any partner can leave the alliance without any sanctions except for eventual loss of reputational capital.

F) OECD-UNGP-ILO-MNEs

What follow are international treaties and agreements covering human rights (HRs) in general such as the United Nations Guiding Principles on Business and Human Rights (UNGP), the Guidelines on Responsible Business Conduct of the Organisation for Economic Cooperation and Development (OECD-RBC), and the Declaration on Multinational Enterprises of the International Labour Organisation (ILO-MNE).

Intergovernmental agreements have played a major role in improving the labor conditions in general such as listed below.

1. **The United Nations Guiding Principles on Business and Human Rights**

After decades of debates regarding how human rights applied to businesses, the United Nations Guiding Principles on Business and Human Rights (UNGP) was approved in June 2011 (United Nations Human Rights 2014). By clearly stating what the responsibilities of businesses are, the UNGP provides businesses with a framework to respect and avoid violations of human rights. Not only has the Human Rights Council endorsed the principles, but many companies, business organizations, civil society organizations, trade unions, and national and regional institutions support them and other stakeholder groups (United Nations Human Rights 2014).

Ultimately, the finished text includes 31 principles. The UNGPs are not comprised of legal obligations, but rather they clarify businesses' obligations to uphold human rights in their practices and provide states and businesses with guidance. Most importantly, they define corporate responsibility in this regard (United Nations Human Rights 2011). The UN Working Group on the Issue of Human Rights and Transnational

Corporations and Other Business Enterprises further promotes the principles. In addition, the UN Working Group endeavors to create a dialogue on the topic of good business practices and to discuss the lessons learned through experience. It aims at getting agreement on remedial action in favor of victims of human rights abuses.

www.ohchr.org/Documents/Publications/GuidingPrinciplesBusinessHR_EN.pdf

2. **OECD Guidelines on Responsible Business Conduct**

The OECD member countries agreed to create the responsible business conduct (RBC) agreement. This is the first set of international agreements that integrate the UN's Guiding Principles on Business and Human Rights (OECD 2014b). The governments who signed onto the agreements are required to set up a National Contact Point (NCP) that essentially handles and attempts to resolve issues related to the guidelines, for example, cases of businesses not adhering to the Guidelines. The NCPs must rely on inputs from stakeholders and their relationships with other businesses and nongovernmental organizations (NGOs). National Contact Points do not act as judicial bodies, but rather as problem-solvers providing guidance to the businesses (OECD 2014b).

Between 2000 and 2019, NCPs have handled more than 500 cases relating to company operations in over 100 countries and territories. The majority of cases since 2011 deal with human rights (57%), followed by general policies, which include expectations related to due diligence (53%), followed by employment and worker issues (40%) and environment (21%) (OECD database RBC). Only six cases (incidences) related to the fishing industry, but none of the six pertained to working conditions.

The specific instance mechanism has been part of the Guidelines since the 2000 review.

*Over 450 specific instances have been treated by country NCPs in over 100 countries and territories since then. OECD Watch, (2020) Search results for fish, 9 cases dealing with fishery sector but none related to labour conditions on the ships, 1 September 2020, OECD Watch/SOMO GL Amsterdam, NL; https://complaints.oecdwatch.org/@@search?SearchableText=fish*

3. **ILO Tripartite Declaration of Principles Concerning Multinational Enterprise and Social Policy: The MNE Declaration**

The tool that businesses can use to get instruction on good business practices is the ILO's MNE Declaration, which was adopted in Geneva, Switzerland, in 1977 by the governing body of the ILO; it was last revised in 2017 to concur with following developments. They are the new labor and policy outcomes that were put forth by the 329th International Labour Conference in 2017, the Guiding Principles on Business and Human Rights endorsed by the Human Rights Council in 2011, and the adoption of the 2030 Agenda for Sustainable Development. However, the declaration is nonbinding and can easily be stopped by one or two of the tripartite constituencies at local level.

4. **UN Working Group on the Issue of Human Rights and Transnational Corporations and Other Business Enterprises**

The mandate of the Working Group is broad and far-reaching. Key features of the mandate given to the Working Group by the Human Rights Council in 2011 are (1) to promote the effective and comprehensive dissemination and implementation of the Guiding Principles on Business and Human Rights: Implementing the United Nations "Protect, Respect and Remedy" framework and (2) to continue to explore options and make recommendations at the national, regional, and international levels for enhancing access to effective remedies available to those whose human rights are affected by corporate activities, including those in conflict areas (UN-OHCHR 2018).

In contrast to the UNGP, the ILO MNE Declaration, and the OECD RBC Guidelines, the goal of the UN Working Group is to reach an agreement through a convention that identifies ways to provide remedies to human rights violations by transnational companies.

Until such a binding convention or treaty is reached, the OECD RBC Guidelines offer the most effective methods, also referred to as "soft law practice," to address human rights violations by transnational companies and enterprises in general no matter their size (Tapiola 2018).

## Solutions

### The ILO Response

In response to the growing concern of forced labor and human trafficking in the fishing sector, ILO is developing a 5-year, holistic, multifaceted, and integrated program – "Global Action Programme against forced labour and trafficking of fishers at sea" (GAP fish).

The program aims to become a cross-cutting global initiative that will have regional and national impacts to promote and protect fishers' human and labor rights with the following outcomes:

- Development of sustainable solutions to prevent human and labor rights abuses of fishers in recruitment and transit states.
- Enhancement of capacity for flag states to ensure compliance with international and national laws on board vessels flying their flag to prevent forced labor.
- Increased capacity of port states to address and respond to situations of forced labor in fishing.
- Establishment of a more knowledgeable consumer base of forced labor in fisheries.

## Closing Comments

Efforts to stop the HR violations of workers (migrant and local) on fishing ships have not been successful on a sustained basis. Remedial actions are required which go beyond the many well-intentioned attempts to bring an end to the human trafficking and slavery conditions on fishing ships.

As can be seen from the assessments given to the different international agreements, none of the treaties or agreements are binding nor have all UN member countries signed up to them.

What is urgently needed is a binding agreement either in form of a strengthened existing agreement or in form of a new international agreement.

It is also urgently needed that MBA schools teach courses covering human trafficking on fishing ships and equally useful and timely would be publications with a target advocacy for good business behavior.

# Foreign Immigration and Economic Growth

Suwastika Naidu[1], Atishwar Pandaram[1], Anand Chand[1] and Arvind Patel[2]
[1]School of Business & Management, University of the South Pacific, Suva, Fiji Islands
[2]School of Accounting, Finance & Economics, University of the South Pacific, Suva, Fiji Islands

## Synonyms

Economic Growth Rate; Foreign Population; Inflow

## Definition

Foreign immigration Refers to international movement of people to a destination of which they do not possess citizenship.

## Introduction

In the last decade, the global influx of foreign population in a number of developed countries has rapidly increased, leading to the imposition of stringent measures on the movement of people across international borders (Massey 1990; Clemens 2011). There are a number of factors that determine the decision of an individual to cross international borders. Some of the factors that pull people across international borders are the host country's wage rate, labor market regulations, and socioeconomic and demographic changes (Clemens 2011; Peri 2012; Tani 2019). The G7 countries have vast economic resources and opportunities that pull people from the third world countries (European Union 2019). Specifically, the G7 countries studied in this entry are the USA, UK, Japan, Italy, Germany, France, and Canada. There are two reasons for studying the G7 countries in this entry. First, the G7 countries have an influence on the economic policies implemented around the world. These policies are implemented to enhance the growth of the trade sector, financial liberalization, and economic development in the G7 countries. These imply that the G7 countries are most likely to attract foreign population (World Population Review 2019). Second, all the G7 countries are the world's top exporting countries and have high net worth per capita. It is more likely that the high level of income and employment in the manufacturing companies of the G7 countries are attracting migrants from the low-income countries (World Population Review 2019).

Existing studies have confirmed that the impact of foreign population inflows and economic growth have found mixed results. Few studies have confirmed that the influx of foreign population has a significant impact on

F

the economic growth (Osbild and Bartlett 2019; Clemens and Pritchett 2019; Clemens 2011; Morley 2006), while a number of studies have confirmed that the inflow of foreign population has a relatively insignificant impact on the economic growth (Kerr and Kerr 2011; Massey 1990). All these studies have focused on the impact of the inflow of foreign population on the wage rates, unemployment, and overall well-being. One study used the Autoregressive Distributed Lag (ARDL) model to examine the relationship between immigration and economic growth. Morley's (2006) study was based on Canada, Australia, and the United States and had covered the period from 1930 to 2002. This study is based on the G7 countries and covers the period from 1960 to 2018. On the basis of the unit root test, this study examines the relationship between the inflow of foreign population and the economic growth by using the Ordinary Least Square (OLS), and Dynamic Ordinary Least Square (DOLS) estimators.

There are two reasons why OLS and DOLS have been used in this study. First, comparing the results of two regression models helps us to check the robustness of the research findings. Second, using the DOLS helps us to address the model's simultaneity problem. To estimate the short-term dynamics, the VECM was used for two reasons. First, the VECM captures both the short-term dynamics and longrun error correction in the model. Second, the VECM automatically addresses the problem of model defects (Enders 1995). By incorporating the error correction term, the errors and defects in the model are effectively captured and addressed. Third, when estimating the model, the model does not require an estimate of normalization and endogeneity.

Based on the studies conducted by Kerr and Kerr (2011), this study examines how foreign population inflows affect economic growth. We chose G7 countries to examine these issues in the context of the relationship between the inflow of foreign population and economic growth. The G7 countries have been receiving inflow of foreign population from the third world countries as these countries offer numerous opportunities for the migrants.

There are nine main sections in this entry. Section two provides an overview of foreign population inflow and economic growth rates of the G7 countries. Section three reviews the existing literature. The model specification is provided in section four and section five outlines how the data was collected for this study. The research findings are presented in section six and section seven discusses the research findings. Section eight outlines the conclusion and limitations of this study.

## Overview of Inflow of Foreign Population and Economic Growth Rate of the G7 Countries

The G7 countries are the seven industrialized countries around the world that play a crucial role in the global economic growth, financial crisis management, and global security and terrorism (Council on Foreign Relations 2019). These countries are the drivers of the global economic resources around the world, as investors prefer to invest in the G7 countries, as they are likely to maximize their returns if they invest in the stock market of these countries (Council on Foreign Relations 2019). A close examination of Fig. 1 indicates that the economic growth rate of the G7 countries has been highly volatile due to changes in global politics, economic imbalances, natural disasters, and policies and procedures on capital market liberalization (Council on Foreign Relations 2019). There are both periods of slump and boom noticed in Fig. 1. The periods of slump are deeper than the periods of boom, and all G7 countries face slumps and booms in approximately the same period (Council on Foreign Relations 2019). This entry examines the economic growth rate of G7 countries: Canada, France, Germany, Italy, Japan, the UK, and the USA. The G7 group was formed during the 1970s as a response to the financial troubles faced by the global economy. Unfortunately, critics have mentioned that China and India should be included in the group of G8 countries because the economic power is shifting from the western countries to China and India (Council on Foreign Relations 2019).

**Foreign Immigration and Economic Growth, Fig. 1** Economic Growth Rate of the G7 Countries. (Source: Data was extracted from the World Bank Database (2019) and the graph was developed by the authors)

A comparative analysis of the inflow of foreign population to all the G7 countries shows that Germany and the USA demonstrate similar trends as compared to Canada, France, Italy, Japan, and the UK (Fig. 2). A seasonality effect has been noticed in the inflow of foreign population to Germany and the USA (Morley 2006; Clemens 2011). However, in the case of Canada, France, Italy, Japan, and the UK it has been slowly trending upward. There are a number of factors that are driving the high volatility in the inflow of foreign population and this includes changes in immigration laws, wage rates, employment levels, and opportunities in the host countries (Morley 2006; Clemens 2011).

## Literature Review

A close synthesis of existing literature shows that the impact of migration on the economic growth is determined by the changes in the domestic country's labor supply, intellectual capital, wage rate, and total factor productivity (Kerr and Kerr 2011; Clemens and Pritchett 2019). The socioeconomic context of G7 countries has been determined by the changes in the wage rate policies, welfare systems, and national labor laws and regulations (Kerr and Kerr 2011; Morley 2006). Numerous existing studies have emphasized that future studies should examine the empirical relationship between inflow of foreign population and economic growth of the large developed countries (Kerr and Kerr 2011; Mocetti and Porello 2010). Existing studies that have empirically examined the impact of immigration on the economy of the host country has shown mixed results (Clemens 2011; Osbild and Bartlett 2019). We can categorize the studies on the impact of migration on economic growth in two categories. The first category includes studies that have found a statistically significant impact of migration on the determinants of economic growth and the second group includes studies that have found

**Foreign Immigration and Economic Growth, Fig. 2** Inflow of Foreign Population to the G7 Countries. (Source: Data was extracted from the OECD (2019) and the graph was developed by the authors)

insignificant impact (Kerr and Kerr 2011; Mocetti and Porello 2010; Clemens 2011; Osbild and Bartlett 2019). This study is based on the impact of inflows of foreign population on the host country rather than on the internal mobility of labor within the host country.

To begin with, studies that have proved that there is a significant impact of immigration on the determinants of the economic growth have explored both the positive and negative impact of immigration on the national economy. Osbild and Bartlett (2019) found that in the case of Western Balkan region, an increase in the inflow of foreign population leads to an increase in the unemployment rates. Intuitively, an increase in the inflow of foreign population in the host countries will increase the level of national competition to secure employment. As Clemens and Pritchett (2019) argue, efficient spatial distribution of labor is extremely important as it increases global production. The migration barriers would definitely reduce production as it acts as a hindrance to spatial reallocation of labor. The private sector employers have benefited from the global shifts in labor, as automatic adjustments in the wage rates lead to employers enjoying cheap labor and low production cost. High barriers to entry, in the form of travel restrictions, acts as a strong deterrent to people's desires to move to the developed countries. As Clemens (2011) argues, small reductions in the barriers to labor mobility have enormous benefits to the global economy. If migration barriers are removed, people from the poor countries will move to the richer countries.

This movement of people would lead to a number of efficiency gains to the destination countries. Morley (2006) examined the causality between per capita economic growth rate and immigration in Australia, USA, and Canada. The findings from this study confirmed that there is longrun unidirectional Granger causality running from per capita economic growth to immigration.

Furthermore, existing studies that have found there is minimal effect of immigration on the host country have mainly focused on the wage and employment levels in the host country. Friedberg and Hunt (1995) found that a 10% increase in the number of immigrants will reduce the wage rate of the natives by 1%. This entry highlighted that the skills provided by the foreigners and the natives can be easily substituted but this does not imply that the inflow of foreign population will lead to a decrease in the welfare of the natives. Kerr and Kerr (2011) found that the immigrant labor usually earn lower than the natives of the host country. The recent immigrants in the Northern Europe tend to use more social benefits than the native citizens. There are a number of factors that influence the social and economic impact immigration and some of the factors that were considered by Kerr and Kerr (2011) were (1) age of the individual during arrival, and (2) reason for migration. The intention of the individual to immigrate will affect the type of economic activities that the migrant will engage in the host country. Those immigrants who have just arrived in the host country are more likely to use welfare assistance as compared to those who have been in the host country for a long period of time. It has been viewed in the existing literature that immigration has adverse impact on the European public finances. There are numerous studies that have confirmed that the fiscal impact of immigration is extremely small. Building on this study, Massey (1990) argues that immigrants consider social and economic benefits as two priority factors in the host countries when they decide to immigrate to the host countries.

Similarly, existing studies that have found no effect of immigration on the host country factors have mainly focused on the total factor productivity and employment levels as the dependent variable in the model. Peri (2012) did not find any effect of immigration on the employment levels. Gonzalez and Ortega (2011) found that the inflow of unskilled foreign population did not affect the employment levels in Spain. Tani (2019) argued that Australia's migration policy is not an important tool that can be used to manage its human capital. Dustmann et al. (2010) did not find that immigration influences unemployment and wages in the British labor market. Bonin (2005) did not find any relationship between foreign population inflow and unemployment in Germany.

Unfortunately, only a few studies have explored the relationship between immigration and economic growth. Morley (2006) examined the relationship between immigration and economic growth by using the Autoregressive Distributed Lag (ARDL) Model. This study expands the existing literature by comparatively analyzing the relationship between inflow of foreign population and economic growth rate of the G7 countries. The list of G7 countries included in this study are the UK, USA, Japan, Italy, Germany, France, and Canada. Drawing from the studies conducted by Kerr and Kerr (2011), this study will examine this relationship in the context of the socioeconomic factors present in the G7 countries. This study explores the relationship between immigration and the economic growth rate by using the Dynamic Ordinary Least Square (DOLS) and Ordinary Least Square (OLS) models to explore the relationship between immigration and economic growth of the G7 countries. These are the two best models that can be used for the estimation of the data that is available for the period 1960–2018. These two models were used for estimation because our econometric results show that our variables are not integrated to different order.

## Model Specification

To start with the analysis, unit root test has to be conducted to determine the integration of the variables used in the estimation. Following the studies conducted by Naidu (2017) and Naidu

et al. (2017), this study performed the unit root test on two variables used for estimation in this paper. These two variables are Economic Growth Rate ($ECR_t$) and Inflow of Foreign Population ($IFP_t$). The Augmented Dickey Fuller and Dickey Fuller-Generalized Least Square test has a null hypothesis that the variables have a unit root. Following the completion of the unit root test, Bai-Perron multiple breakpoint test was conducted to incorporate structural breaks in the estimation strategy. Both Akaike Information Criterion (AIC) and Schwarz Information Criterion (SIC) were used to determine the Vector Autoregression (VAR) Lag order selection criteria. The Johansen's Cointegration Test was used to determine longrun cointegration between $IFP_t$ and $ECR_t$. In this entry, we used the cointegration methodology developed by Johansen (1991, 1995) to determine the longrun cointegration between $IFP_t$ and $ECR_t$. To model the cointegration between the independent and dependent variables, we considered the VAR with the order of p (Johansen 1991, 1995):

$$ECR_t = A_1 ECR_{t-1} + \ldots\ldots + A_p ECR_{t-p} + \vartheta IFP_t + \in_t \quad (1)$$

In Eq. 1, $ECR_t$ is a k-vector of a I (1) variable, $IFP_t$ is a d-vector of a deterministic variable, and $\in_t$ is the error term. Equation 1 can be rewritten as follows:

$$\Delta ECR_t = \delta ECR_{t-1} + \sum_{i=1}^{p-1} \alpha_t + \Delta ECR_{t-i} + \vartheta IFP_t + \in_t \quad (2)$$

In Eq. 2, α is the number of cointegrating relationships and ϑ is the number of cointegrating vector. To estimate the longrun relationship between the variables, we used OLS and DOLS for three reasons. First, comparing the findings from two regression models helps us to check the robustness of the research output. Second, using the DOLS helps us to tackle the problem of simultaneity in the model. The DOLS estimator is captured in Eq. 3 as follows (Mark and Sul 2003; Chikalipah and Okafor 2019):

$$ECR_{y,1} = \alpha + \beta_1 IFP_t + \gamma Dum_\alpha + \theta Dum_{\beta_1 IFP_t} + \sum_{i=-k}^{k} \cup_i \Delta IFP_{t-i} + \mu_i \quad (3)$$

In Eq. 3, $Dum_\alpha$ and $Dum_{\beta_1 IFP_t}$ represent the dummy variables that captures the structural breaks in the series. After the longrun relationship has been established and the error correction terms (ECT) is generated for each longrun model, the next step is to determine the shortrun relationship between $IFP_t$ and $ECR_t$ by using the ECM framework. According to Kim (1998), there are a number of advantages of using the ECM in this paper. First, the VECM captures both the shortrun dynamics and the longrun equilibrium in the estimation model. Second, the VECM automatically addresses the problem of model misspecification (Enders 1995). Third, the model does not require the estimation of normalization and endogeneity while estimating the model. The VECM is depicted as follows (Mark and Sul 2003; Chikalipah and Okafor 2019):

$$ECR_{ij,t} = \beta_0 + \sum_{q=0}^{m} \omega_q IFP_{i,t-q-1} + \vartheta \varepsilon_{t-1} + \mu_i \quad (4)$$

In Eq. 4, $\varepsilon_{t-1}$ is the one period lagged error terms, $ECR_{ij,t}$ is the economic growth rate for time period $t$, and $IFP_t$ is the inflow of foreign population. The final model used to determine the causality between $IFP_t$ and $ECR_t$ is the Granger causality test and is captured by the following equation (Chiou-Wei et al. 2008; Narayan and Prasad 2008):

$$ECR_t = \beta_0 + \beta_1 ECR_{t-1} + \ldots + \beta_1 ECR_{t-l} + \alpha_1 ECR_{t-l} + \ldots + \alpha_l ECR_{-l} + \in_t \quad (5)$$

$$IFP_t = \beta_0 + \beta_1 IFP_{t-1} + \ldots + \beta_1 IFP_{t-l} + \alpha_1 IFP_{t-l} + \ldots + \alpha_l IFP_{-l} + \mu_t \quad (6)$$

In Eqs. 5 and 6, $IFP_{t-l}$ represents the $l$ lag of $IFP_t$ and $ECR_{t-l}$ represents the $l$ lag of $ECR_t$.

## Data

The data for this study was collected from the Organisation for Economic Co-operation and Development (OECD) database and the World Bank database. Specifically, immigration was proxied by inflow of foreign population by nationality and economic growth rate was proxied by GDP growth (annual world percentage). There are two reasons for selecting the G7 countries for this research. The OECD data on the inflow of foreign population was only available for G7 countries. Unfortunately, data for Russia was missing, therefore, we could not include the eighth country from the list of G8 countries in our analysis. Data on economic growth rate was available from 1961 to 2017 and data on inflow of foreign population by nationality was available from 1980 to 2016.

## Research Findings

Table 1 presents the results of the Augmented Dickey Fuller Test (ADF) and Dickey Fuller-Generalized Least Square (DF-GLS) unit root test shows that the dependent and independent variables are integrated to a different order for the G7 countries. The ADF test confirms that ECR is I (0) for all the G7 countries and IFP is I (1) for all the G7 countries. On the other hand, DF-GLS shows mixed results. The DF-GLS test results show that ECR is I (0) for the USA, UK, Germany, France, and Canada and I (1) variable for Japan and Italy. Similarly, the DF-GLS test results shows that IFP is I (0) variable for the USA and I (1) variable for the UK, Japan, Italy, Germany, France, and Canada.

The results of the multiple breakpoint test presented in Table 2 shows that there is only one sequentially determined break for Japan noted in the year 1992. The multiple breakpoint test did not find any breakpoints for the USA, UK, Italy, Germany, France, and Canada.

Results of the VAR Lag Order Selection Criteria is presented in Table 3 and shows that based on the SIC value, lag length of one is selected for the ARDL bounds test estimation.

The results of the unrestricted cointegration rank test are presented in Table 4. According to the longrun cointegration test, there are two cointegrating equations between the variables used to determine the cointegrating relationships in the USA, and one cointegrating equation for Italy, Germany, France, and Canada. There are no cointegrating equations for the UK.

Table 5 captures the results for the longrun impact of foreign population inflows on the economic growth rate. The OLS results show that the foreign population inflows have a statistically significant impact on the economic growth of the USA, Italy, and France. More specifically, the results show that one unit increase in foreign population inflows will decrease economic growth of the USA and Italy by 0.0000026 units and 0.00000694 units, respectively. On the other hand, the results also indicate that one unit increase in the foreign population inflows will increase economic growth of France by 0.00000889 units. Both the Serial Correlation LM test and the Breusch-Pagan-Godfrey heteroskedasticity test shows that our research findings are free from the problem of serial correlation and heteroskedasticity.

The shortrun results are presented in Table 6. The findings confirm that the shortrun changes in the inflow of foreign population have a statistically significant impact on the economic growth rate of the USA, at 5% level of significance. The statistical significance of the relationship between the inflow of foreign population and the economic growth does not exist for the case of Italy, Germany, France, Canada, Japan, and the UK. The lagged one period error term is significant for the USA, Germany, and France at 1% level of significance whereas the lagged one period error terms is significant for Canada at 5% significance level. The high value of coefficients indicate that the adjustment to the equilibrium is 23.4% for the USA, 31.9% for Germany, 43.5% for France, 28.6% for Canada.

The results of the pairwise Granger Causality Test indicate that there is unidirectional causality running from migration to economic growth of Italy (see Table 7). This statistical significance

**Foreign Immigration and Economic Growth, Table 1** ADF and DF-GLS unit root tests for the dependent and independent variables

does not exist in the case of the USA, UK, Japan, Germany, France, and Canada.

## Discussions

The results show that 1% increase in foreign population inflows will decrease economic growth of the USA and Italy by 0.0000026% and 0.00000694%, respectively. The findings from this study is parallel to the findings of the studies that have proved that there is minimal impact of immigration on indicators of economic growth. Unlike existing studies, this study has focused on economic growth rather than the indicators of economic growth (Friedberg and Hunt 1995). Undoubtedly, inflow of foreign population is essential for the USA because it increases the size of the population and addresses the shortage of labor problems. A number of articles have confirmed that with the recent attempts to reduce the inflow of foreign population, there can be negative impacts of this move on the national economy of the USA. On the other hand, the findings from this study proved that the inflow of foreign population would lead to a minimal negative impact on the economic growth of the USA in the long run. One of the possible factors explaining this minimal negative impact on the economic growth is the negative impact of immigration on the foreign population itself, as in the competitive workforce of USA, it is extremely difficult for the immigrants to find employment if their qualifications do not meet the US standards. In a highly competitive US economy, immigrants will need to hold qualifications and expertise that is able to differentiate them from the native workers (The National Academy of Sciences 2019). Another reason for restricting the inflow of illegal population is to reduce the threats from the terrorist activities faced by the US economy. Existing debates have confirmed that tracking down criminals with very bad records has led to far less success than expected. Drawing from this argument, it is expected that illegal and terrorist activities cause national panic and this imposes negative pressure on the economic growth.

Similarly, the inflow of foreign population will lead to a minimal decrease in the economic growth of Italy. A number of studies have

confirmed that the inflow of foreign population to Italy is characterized by unskilled workers. A close examination of the recent statistics indicates that Italy has been a victim of large immigration of unskilled workers with a number of studies noting that immigrants to Italy frequently settle in the richest regions. As compared to other European countries, Italy has a low tendency of attracting high-skilled immigrants due to its favorable location for immigrants from Africa. The contemporary economy of Italy has focused on the traditional industries, and undoubtedly it is able to attract low-skilled immigrations. Most of the immigrants to Italy are low-skilled and low paid workers. A comparative analysis of the education level of native population with that of the foreigners indicates that there is not much difference in the skill level of the two groups. As argued by the Cobb Douglas production function, technological progress is driven by the availability of skilled and unskilled workforce. In the case of Italy, unskilled workers are less likely to innovate, which may exert downward pressure on the economic growth.

On the other hand, the results also indicate that one unit increase in the foreign population inflows to France will increase economic growth rate by 0.00000889 units. The findings from this study are similar to the findings from the study conducted by d'Albis et al. (2016). According to d'Albis et al. (2016), immigration has a positive impact on GDP per capita in France. Ortega and Peri (2009) confirmed that immigration has positive impact on France as compared to other OECD countries. As argued by d'Albis et al. (2016), the immigration policy influences who will be receiving work permits based on their education and background. A close examination of the number of residents receiving permits to France are mainly youngsters who provide complementary skills to the native labor (d'Albis et al. 2016). Some of the characteristics of the young workforce that may drive positive economic growth are (1) high productivity, (2) ability to quickly accept changes in technology, (3) versatility, and (4) innovativeness.

## Conclusion and Limitations

The main aim of this study was to investigate the relationship between foreign population inflow and economic growth of the G7 countries. To investigate this relationship, we used data from the UK, USA, Canada, France, Germany, Italy, and Japan, which were considered for the econometric analysis. The findings from this study confirmed that one unit increase in the foreign population inflows will decrease economic growth of the USA and Italy by 0.0000026 units and 0.00000694 units, respectively. The results also indicate that one unit increase in the foreign population inflows will increase economic growth of France by 0.00000889 units. The findings from this study has implications for a number of stakeholders. First, the G7 countries are the most powerful countries of the world and the immigration patterns noted in each of these countries is driven by the changes in the wage rate, employment, and socioeconomic conditions faced by each of these countries. Second, foreign population inflow has a positive impact on the economic growth of France. In order to cushion the negative impact of the foreign population inflow on the economic growth of the USA and Italy, there should be strict immigration policies on the inflow of foreign population to these two countries. By widening the scope and scale of the private sector and encouraging the growth of the modern industries in the USA and Italy, the policy makers of these two countries can encourage automatic adjustment of the economic growth rates to the equilibrium. One of the limitations of this study is that it is based on G7 countries with Russia being excluded from our analysis. Future researchers can build onto this study by exploring the nexus between the inflow of foreign population and economic growth of regional trading blocs and comparatively analyzing how the impact of the foreign population inflows on the economic growth differs by the geographical region.

## Introduction

Latin American foreign policies are public policies implemented by the political leaders of the countries of the region in order to reach higher levels of development and security through cooperation with the international system. Their analysis, therefore, has to combine a high number of elements ranging from world politics, patterns and trends of the global economy, national political systems, leaders' worldviews, and strategies of development to the nature of the threats to the states or their population.

A comprehensive overview of the literature leads to claim that the analysis of Latin American foreign policies, by both practitioners and students, has to consider the impact of the following five "I factors": the international system; the institutions; the individuals; the shared Latin American identity; and the countries' interests. The principal idea of this entry is that both practitioners and students of the field would miss "the whole picture" if they chose to focus only on some of these factors.

The five factors are strongly interrelated and their combination is fundamental to understand the logic of Latin American foreign policies at two different levels. The first one is the "real" political level, which means the day-to-day behavior of Latin American leaders when it comes to the relations between their countries and the region and/or the rest of the world. The second level is the "academic" level, meaning the way scholars of Latin American foreign policies and Latin American International Relations have built this research field.

Although it is clear that each and every Latin American country has its own particularities, this entry focuses on the broad similarities that they share. Therefore, the focus is on the known information about Latin American foreign policies "in general," and the entry does not include the vast production of national case studies. It also leaves to a second plan the numerous contributions focused on particular issues or topics such as the relations between the region and the United States or China. Finally, the entry refers to a traditional geographical definition of Latin America, meaning all the independent countries of the hemisphere excluding Canada and the United States. Or, to put it in simple terms, it includes the 33 states forming the Community of Latin American and Caribbean States (CELAC).

## The Five Factors

The interaction between the geographic and economic context in which the region is inserted, the political processes at the national level, and the challenges of Latin American countries are the point of departure of the five fundamental "I factors" mentioned to understand and analyze Latin American foreign policies. Even though these factors may directly affect one another, they are presented separately all along the next section. This allows describing more precisely why they are central and how the literature has addressed each of them.

### International Context

Since the independence processes from European colonial rule at the beginning of the nineteenth century, Latin American countries have formed a region deeply integrated into the international political and economic system. Nevertheless, from a global perspective, neither the region nor any of its member states has ever been a major player on the international scene. Historically, at some point, countries like Cuba or Panama have momentarily been at the center of geopolitical issues with international consequences. But this was never explained or caused by their own power.

Nowadays, no Latin American country can claim to be a top-level actor in any of the elements that Susan Strange described as the sources of structural power: security, finance, innovation, knowledge, or welfare (Sanahuja 2008). Regarding soft power, the countries of the region also have limited resources. In 2010, McClory ranked Brazil and Mexico the top two countries of the region in terms of soft power, but both outside the top-20 countries at the global level (McClory 2010). Moreover, in the last years, both of them have been facing major crises related to internal

political and social stability, limiting their capacity and will to play a bigger role on the international scene.

This low importance of the region in the world system is simple to explain and understand. No Latin American country figures in the top-40 countries of the world in terms of economic and human development; no Latin American country possesses nuclear weapons or weapons of mass destruction; and no Latin American country presents a security threat for North American and European countries. At the regional level, for decades Latin American countries have been highly able to avoid the militarization of their conflicts. This explains why the literature frequently refers to Latin America as a "zone of peace" within the international system.

Therefore, it is possible to argue that the region is too weak to be naturally present at the decision-making level in the most powerful international organizations. On the global scene, none of its countries can pretend to the rank of a veto player. Nevertheless, Latin America is also "too developed" or "too advanced" to be a top priority for international cooperation. This is true both at the regional level and at the national level, in the latter case the State of Haiti being a notable exception. In the end, broadly speaking, the region is in the periphery of the world system because it is not a trouble-maker that can challenge international order nor a problem-solving actor. That is, Latin America as a whole does not threaten the security of the great powers and it lacks the capacity, will, leadership, and political capital to be a reference on the global scene.

This peripheral situation of Latin America in the world system has major consequences at both theoretical and real politics levels. As Tickner argues, the questions of dependency and autonomy of the region have been central in the theoretical debates in Latin America (Tickner 2015). Arguably two of the most important theoretical contributions of Latin American theorists – dependency theory and peripheral realism – are directly related to this issue. In one of the few books that precisely look at Latin American foreign policies, Mora and Hey claim that dependency theory and the realist paradigm applied to the third world are two "dominant explanatory themes" also related to the fact that they both "pay attention to the asymmetries in the relationship between the United States and Latin America" (Mora and Hey 2003, pp. 2–3).

The logic of the dependency theory was developed in the 1960s and 1970s. Some of its most important authors, sociologists Fernando Henrique Cardoso and Enzo Faletto, tried to explain from a sociological perspective the underdevelopment of the region and its peripheral-dependent relation with the global capitalist system. Since its formulation, the theory has been submitted to numerous challenges. Its overtly deterministic logic and its empirical limits, above all since the region started to experience greater economic development in the 1990s, brought it many justified critiques. Nevertheless, as Tickner argues, dependency theory still has theoretical validity and influence today for its original Latin American contribution regarding the thinking about "the state, national development and sovereignty" (Tickner 2013, p. 88).

In the political field, the dependency theory also echoes in the actual debate regarding the costs and benefits of the patterns of insertion of the region in the world. The issue of economic "reprimarization" related to the region's economic growth of the 2000s caused by higher trade levels of primary products with Asian countries is a concrete example of the current application of elements of dependency thinking. At the foreign policy decision-making level, this intellectual framework also helps to explain the ideological divide between regional integration processes such as the South American Common Market (MERCOSUR) and the Pacific Alliance (AP). While the former has maintained a regional industrialization agenda, the latter had predominantly looked for the increase of exports of raw materials to growing Asian economies.

A second major theory of international relations coming from the region was proposed by Carlos Escudé at the beginning of the 1990s with the objective of explaining that being in the periphery is not a synonym of a total lack of autonomy (Escudé 2015). According to the author, being in the periphery gives at least two

options to the states: being a "rule taker" or a "rebel state." This room for maneuver explains, among other things, why Latin American countries do not all and always follow the same policy lines, even when the international system has limitations on them. Following the same logic, Russell and Tokatlian identify no less than five different foreign policy models that Latin American countries have implemented towards the United States since the end of the Cold War (Russell and Tokatlian 2009, p. 213).

It is important to mention that this contribution of Escudé is also based on the groundbreaking works of Helio Jaguaribe and Juan Carlos Puig, two influential thinkers of the 1970s and 1980s, respectively, who proposed their vision of Latin American international relations from a normative and Law-oriented perspective. For Jaguaribe and Puig, a major part of the problems of Latin American governments in their relations with developed countries resulted from the erroneous appreciation of their proper room for maneuver to take decisions autonomously. For these authors, the world's systemic conditions made possible the construction of internal decisions, allowing Latin American national elites to define policies such as regional integration to increase the autonomy of the region. In this sense, it is possible to argue that Escudé's major contribution is also inspired by decades of academic reflections regarding regional integration and by numerous attempts to construct Latin American regional political and economic organizations since the 1960s.

At the "real politics" level, the condition of being in the periphery has three main consequences on the definition and orientation of Latin American foreign policies. First, the economy of each and every Latin American country highly depends on the exploitation and exportation of primary products. This reality places Latin American countries in a constant situation of competition for foreign investments and access to external markets. As Cason claims, this is one of the major disadvantages that "lead countries to limit their integration projects to commercial liberalization, and [. . .] make developing countries especially unwilling to give up sovereignty to or even pool it with supranational institutions" (Cason 2011, p. 3). In other words, the level of complementarity between the economy of Latin American countries is arguably the lowest of the whole world, and this fact is fundamental to understand the tensions that characterize many regional organizations.

The second impact of regional economic dependency, when related to economic underdevelopment, is the necessity for Latin American governments to focus their foreign policies on short-term goals and benefits. About two decades ago, Van Klaveren (1992) claimed that the combination of international with national factors helped understand why Latin American countries historically looked for security, development, and regional power equilibrium through their foreign policy. More recently, Gardini and Lambert have listed the main goals of Latin American foreign policies as follows: "economic prosperity, poverty alleviation, quality of democracy, human rights and regional and multilateral cooperation in spheres other than security" (Gardini and Lambert 2011, p. 4).

The third consequence is also identified by Gardini and Lambert. For these authors, the objectives of Latin American countries in the international context also explain why leaders conduct their foreign policy with both ideology and pragmatism. According to them, the combination of both elements explains the "apparent contradictions" in Latin American foreign policies. For Gardini and Lambert, the decisions that are taken by Latin American leaders "are not a sign of incoherence or inconsistency," but the "reflect [of] the dynamic tension between ideology and pragmatism, between the desirable and the achievable" (2011, p. 2). Examples of this pragmatism that explains contradictory behavior in Latin American foreign policies include Hugo Chavez's policy of maintaining the oil exportations to the United States in spite of his "anti-imperialist" discourse, left-wing Evo Morales' Bolivian government's legal recognition of the right-wing Brazilian government of Michel Temer in order to maintain Brazilian investments or the numerous protectionist measures adopted by countries against their partners in free trade or custom union agreements.

### Institutional Weaknesses

Latin American foreign policies and Latin American leaders' behavior on the international scene can also be analyzed through the lens of political institutions. Globally speaking, Latin American countries are characterized by what many authors describe as "hyper-presidential systems," that is, presidential systems with weak limits and controls on the executive power. In a seminal article, Roberto Russell underlined the necessity to look at institutions in order to understand foreign policy decision-making processes in Latin America. According to Russell, the limited number of actors able to compromise societies' resources is a key characteristic affecting the structure of foreign policy decision-making in the region (Russell 1990).

From a comparative perspective, it is also interesting to note that this focus on institutions and on the concentration of power at the presidential level allows applying similar methodological frameworks to democratic and authoritarian regimes. Hyper-presidentialism and its historical background also explain why the study of Latin American foreign policies puts little or no emphasis at all on legislative bodies. In the same line, it is worth mentioning that the literature often considers the foreign policy decision-making process to be highly unified at the executive level and/or abdicated by the legislative power. Here, the questions of the legislative power's will and capacity are central to explain this frequent postulate.

The lack of capacity or interest by congressmen and women to influence on Latin American foreign policies can be explained by a low electoral interest related to international issues, a low parliamentary capacity to affect the policies, and also by the consensual idea of the necessity to protect the treaties signed by the states. The Chilean case is an archetype of this dynamic. The constitution gives the President the authority to define and lead the foreign policy, the Congress basically does not question it and political parties tend to consider the foreign policy as a state policy above party lines (Gotz 2015). Colombia is another interesting example. According to Tickner (2007), the predominant characteristic of its foreign policy decision-making process is the consensus between political and economic elites. This allows the President and his close advisers to play a central role in the definition of the policy, particularly since the 1991 Constitution.

In the Colombian institutional context, the bureaucracy of the foreign affairs department has limited institutionalization, low professionalization, and limited autonomy in front of the executive (Tickner 2007, pp. 97–98). This tends to be the norm in the whole region, arguably with the notable exception of the Brazilian case. Scholars of Latin American foreign policies consider the Foreign Relations department of Itamaraty a model for its high level of professionalization and its capacity to formulate strategies of foreign policy. Nonetheless, the strong bureaucracy of Itamaraty is also challenged by the President's will to play a more active and conducting role in the country's foreign policy (Cason and Power 2006, pp. 121–122).

### Individuals

Considering the institutional weakness in the foreign policy decision-making in Latin America, the other side of the coin is obviously the importance of who is the President in office. At a micro level, the claim of Valerie Hudson (2007) according to which leaders are more prone to define the foreign policy in a personalist system is definitely applicable in the region. According to Malamud (2015), this is also related to the cultural tradition of caudillismo in Latin America. In this context, the personal traits of the leaders have a major importance, for example, the individual propensity to seek consensus or to provoke polarization (Gardini and Lambert 2011, p. 6).

At a macro level, leaders are also important in the analysis of the socialization dynamics they create between themselves. A recent edited book by Gordon Mace et al. (2016) sheds light on the effect of "summitry" on the regional organizations. As the authors claim, socialization has become a central dimension of Latin American international relations at the diplomatic level.

This is especially the case since leaders of the region have been participating, on average, 13 times a year in some 10 different summit levels between the end of the Cold War and 2012 (Portales 2016).

Nonetheless, intense diplomatic activity and centralization of foreign policy decision-making processes are no guarantee of foreign policy efficiency or consolidation of regionalism. On the contrary, it is rather a symbol of the leaders' outright rejection of transferring powers to supranational organizations and to losing control on their foreign policy. In that sense, as Dabène argues, Latin American leaders just tend to reproduce at the international level their traditional behavior towards institutions at the national level (Dabène 2009).

This last idea is significant for both practitioners and students of Latin American foreign policies because it tends to reverse the direction of the causal relation between hyper-presidentialism in decision-making processes and poor institutionalization of regional organizations. Here, the lack of institutionalization of foreign policies and organizations is not just the cause of poor results of integration. It is above all the result of deliberate decisions taken by the leaders.

The most recent illustration of this tendency is the Pacific Alliance treaty between Chile, Colombia, Mexico, and Peru. The foundational treaty of this integration project signed in 2012 explicitly puts the decision-making processes in the hands of the four Heads of State and their ministers of Foreign Affairs – or ministers of Trade or Cooperation – or their corresponding vice ministers. No strong and stable autonomous institution is considered in the treaty. Therefore, the Pacific Alliance seems to be just another example of an organization controlled by the executive power of its member countries. The supporters of this institutional design argue that it gives the organization the flexibility it needs to adjust to an evolving international environment. The skeptics rather argue, like Domínguez, that the "flexibility" of Latin American organizations makes them ineffective and irrelevant (2007, p. 122).

### Identity

Latin America is composed of a high number of states with cultural and historical characteristics that bind them together and give them a strong supranational identity like no other region in the world. During the last decade or so, this factor of identity has been taking a greater space in many discussions related to foreign policies and international relations. According to Domínguez et al. (2004), the description of the region as a "zone of peace" mentioned earlier is directly related to a shared identity that has been central in avoiding the militarization of international conflicts in the hemisphere.

Identity is central to the international relations of Latin American countries to the point that Santa-Cruz (2015) proposes to analyze Latin American regionalism through the lens of liberalism and constructivism. For the author, the idea of the existence of a "family" of Latin American countries (2015, p. 97) helps to understand the relations between the countries of the region and also between the region and other countries such as the United States. But identity is not just related to cultural elements. According to Santa-Cruz, the Latin America identity and its evolution are also the product of the evolution of the international system, the nature of the collaboration in the Organization of American States (OAS), and also "the regional context and changes in their political regimes" (2015, p. 107).

Rivarola and Briceño (2013) also identify the supranational Latin American identity as one of the three major factors that explain the continuous efforts of the countries of the region to advance on the path of further integration. As a matter of fact, many regional treaties and organizations explicitly justify their existence on the basis of this shared identity. The creation of the CELAC in 2010, an organization aimed at reuniting all the countries of the atmosphere excepting Canada and the United States, is the most recent and clearest example of this tendency. For Dubé and Thiers (2017), this also leads looking at the behavior of Latin American leaders on the international scene through the consideration that the Latin American

region is a community with regional organizations that can be considered as "social groups."

### Interests

The question of identity as an element that influences Latin American international relations and foreign policies leads to the complexity of defining the interests of the countries when it comes to strategies of cooperation. On the one hand, as was mentioned previously, the complementarity of Latin American economies is limited and the need to attract foreign investments causes dynamics of competition between them. On the other hand, shared identity can facilitate negotiation processes but may also raise the costs of not cooperating with the region. When the official discourse refers to "brotherhood" and "family," free riding can have symbolic costs that cooperation with "trade partners" may not have. Using the classic game theory model of Axelrod, the "family" factor also means that the probability of meeting in the future is extremely high and that defection may have higher projected costs in the future than cooperation in the present.

This logic is also found in the works of Shadlen (2008) and of Whitehead and Barahona (2005), for whom Latin American leaders are conscious that not participating in the numerous regional organizations may signify that the others could share benefits that one would not have, just as it could mean the loss of the symbolic opportunity to be on the "family picture." In that sense, students and practitioners of Latin American foreign policies should pay attention not just to the traditional typical benefits of cooperation that would be greater trade and security but also to the irrational symbolic ones that come with the constructed image of belonging to a broader family.

One way to illustrate the complexity of Latin American countries' national interests when it comes to analyzing their foreign policies and their relations with the region is the fact that different economic treaties such as the Andean Community of Nations (CAN) or the Pacific Alliance are characterized by low levels of intrabloc trade. In the case of the CAN, the lack of economic interdependence accompanied by ideological divisions between the member states also explain why countries have not been able to consolidate a real economic integration and why Colombia and Peru have opted for "free riding," signing free trade agreements with the United States and the European Union. In spite of its major existential crisis, the CAN is still formally existing and its day-to-day *raison d'être* is hardly related to trade or security reasons.

## Conclusions

This entry presented current analytic trends, topics actually debated and some of the most important works that have shaped Latin American foreign policy studies. Trends, topics, and theoretical frameworks from which scholars keep on building the field nowadays. How different is this field from other regional analysis of foreign policies and from other analysis of Latin American public policy areas?

On the one hand, in many aspects, Latin American foreign policies are not necessarily different from other public policies. Factors like the institutional model and the importance of the leaders are definitely important to understand the nature of the policies oriented towards the national system as well. The condition of dependency and how it structures national economic models and development strategies also has a clear impact on internal politics. On the other hand, the five factors that are fundamental to understand Latin American foreign policies may be just as important to understand the foreign policies of countries of other regions too.

Therefore, it is possible to argue that what could be the specificity of Latin American foreign policies, in their content and decision-making processes, probably resides in how the five factors combine together. That is, what may be different from a comparative perspective may be the weight of each factor in explaining the particularities of

the foreign policies in Latin America and the way they are analyzed. Among the challenges that scholars of Latin American foreign policies are facing today, it is possible to cite the evaluation of the potential impact of the current geopolitical, financial, economic, cultural, and environmental international transformations and issues. It can be expected that these transformations will affect the nature of the relation of the region with the rest of the world, the capacity of the states to face them, the qualities required for the leaders to respond to them, the identity of the region, and the interests of each of its countries.

## Introduction

Foreign policy is a key goal of governments within the Caribbean region. As stipulated in Article 6 of the Revised Treaty of Chaguaramas (2001), it is the "enhanced co-ordination of Member States' foreign and [foreign] economic policies." It is an aim that can be sought after even though efforts at integration are slowed down now. Not much coordination in this aspect of Caribbean policy is actually happening now. This can be attributed to years of growing disharmony, and this has diminished the already inadequate and restricted influence which small states can wield in global affairs. Unfortunately, this is occurring at a point in time when such coordination and cooperation are most desirable, due to the unrelenting global crises.

No longer can nationalistic concerns take priority over the need for an organized and well-coordinated foreign policy. A coordinated Caribbean foreign policy is urgently required, and as a start, a critical review of the existing notion of foreign policy must be undertaken. Economic and political cooperation starts most logically between Caribbean countries. As such, there is the greater prospect for common knowledge of the challenges and shared objectives. Most times, Caribbean countries deny themselves the opportunity of making a difference by splitting their votes by having more than one candidate for appointment for key/important global positions. Unfortunately, the region does not have collective positions with unified support.

## About Foreign Policy

There are several definitions of foreign policy but none is a universally accepted definition. It is described by Holsti (1995) as a behavioral pattern of state which is adopted to respond the international environment in which a state exists. Bruce Russett and Harvey Starr (1996) emphasize that foreign policy is the output of the states into the global politics. Lloyd Jensen (1982) contends "Foreign policy is a pattern of attitude and behavior, which a state adopts to interact with the international community." Generally, it is the power by which states influence or attempt to influence other states in order to achieve its objectives which are seen to be in accordance with its national interests.

According to Holsti (1967), there are three broad categories of interests, namely, vital or core interest, secondly or variable interest, and general or complementary interest. First, core interest is concerned with national survival, for example, protection against external aggression and sovereignty. Second, secondary interest is to enhance the achievement of core interest aim. Examples include trade, communication, foreign aid, and markets. Third, general interest refers to interest that can be realized by any state on its own and is usually long-term plans and visions of the state. All these interests are inextricably linked to foreign policy and are constantly changing given the domestic and global realities and unfolding events.

Critical to the foreign policy process is the variety of subnational actors that participate. These subnational actors include the political executives, embassies, ambassadors, interest groups, news media, and civil society groups. For the primary political actors in the diplomatic process, the heads of government and their members of cabinet and the political structures and resources at hand will define and limit the influence and ability any state has to pursue their international interests. Embassies, Ministry of

Foreign Affairs and foreign ministries practice public diplomacy whereby the national interest are promoted and promulgated by these bodies. They not only advocate the interest of the State they represent but seek external opportunities for it.

Interest groups are private NGOs who put pressure on governments to act in the best interest of its citizenry. More and more, this group is playing a critical role in foreign policy-making process. The most relevant and pressing issues for political leaders to contend with and adapt to are the influence of civil society groups, increased access to information due to the spread and accessibility of information technologies, interest groups and social media. Civil society plays a crucial role.

## Caribbean Foreign Policy

As a small state, with the attributes of small population, market thinness, poverty, and susceptibility to natural disasters, Caribbean's foreign policy is based on the following:

- Respect for the sovereignty and territorial integrity of all states.
- Noninterference in the domestic affairs of other states, except in cases of gross domestic violations of human rights or genocide.
- Respect and observance of international law and the principles of the UN Charter.

Foreign policy within the region is geared at preserving, expanding, and improving relations with strategic countries at the bilateral, regional, and multilateral levels and engaging actively in multilateral forums such as the United Nations, the Group of 77, the Organization of American States, World Trade Organization (WTO), etc. For these states, it is important to have a common position or voice in order to be visible and recognized on the global stage. In this context, the Caribbean Community established the Council for Foreign and Community Relations (COFCOR). This body is mandated to organize the foreign policies of member states and harmonize positions in international organizations and on international issues in order to have common positions.

However, scholars studying the foreign policy of small states have recognized a number of behaviors that small states either do or are expected to exhibit (Marleku 2013). The most common is that small states tend to:

- Display a low level of participation and contribution in world affairs.
- Address a narrow range of foreign policy issues.
- Limit their behavior to their immediate geographic arena.
- Dependent on bigger countries for financial and nonfinancial resources.
- Aim to cooperate and to avoid conflict with others.
- Spend a lot on foreign policy resources for the purpose of guaranteeing physical and political security and survival.

In 2002, COFCOR approved and implemented a modified foreign policy framework. The aim was to enhance regional ties and widen external cooperation. By 2004, COFCOR was advocating for more frequent discussions and coordination among member states. In spite of this, the implementation of foreign policy coordination remains with regional leaders and institutions to manage. This body confronts many challenges such as the conflicting interests of member states; tardiness of member states in providing information necessary for communication, analysis, and coordinating positions; communication and coordination with national agencies limited to foreign ministries; and an expanded international agenda (Granderson 2012).

In 1997, the Caribbean Regional Negotiating Machinery (CRNM) was established. Like COFCOR, this body sought to carry out external trade negotiations. However, it faces a number of challenges, namely, coordinating trade positions and interests of the member states, overlapping mandates with the Caribbean Community Secretariat, increasing concerns on the issue of diminishing sovereignty, and inadequate resources and funding to conduct research and

employ staff (Inter-American Development Bank 2005). In 2009, the CRNM was formally subsumed under the Caribbean Community Secretariat and renamed the Office of Trade Negotiations (OTN). The body would examine and try to resolve member states' concerns about sovereignty.

Within this community, sovereignty remains a standoffish issue, and in an increasingly interdependent world, increased access by external parties to one's borders and territories is a commonplace. Therefore, it becomes quite challenging for Caribbean countries to strike a balance between territorial integrity and growing interdependence. The community has for many years advocated for "small state diplomacy." This is geared toward advancing its interests within the global governance structure. With a relatively average record in promulgating a communal voice of its states, it has been able to access forums within the international community where decisions affecting the region's well-being are made.

## Addressing the Challenges

As part of its diplomatic initiatives, the community must continue to engage with traditional and nontraditional trading partners. Through such interaction, the Caribbean can highlight to the international community its views on critical subjects. Additionally, small state diplomacy can be practiced through regional bodies and overseas-based regional diplomatic missions. For example, the work of COFCOR is complemented by a range of diplomatic missions in overseas capitals including New York, Washington, London, Brussels, and Geneva. Regional organizations such as the Organization of American States (OAS) and the OECS Joint Diplomatic Missions in Ottawa and Geneva also facilitate on community's part in interacting with external partners.

In each state, the Caribbean Community Ambassadors and High Commissioners have regular consultations in the context of the Caribbean Community Caucus which is chaired by a dean. On the other hand, engagement with third countries, groups of countries, and international organizations is facilitated by a number of mechanisms including agreements like memoranda of understanding or cooperation agreements, regular scheduled high-level political encounters, and joint commissions or similar mechanisms.

The Caribbean Community has, to date, enjoyed considerable success in coordinating the foreign policies of its member states, but this has not been without challenges. These include:

- The Caribbean Community's identity crisis: each state either agreeing to the community position or deciding solely in the national interest
- Human, technical, and financial resource constraints
- Rapidly changing geopolitical shifts that require practical strategies and approaches
- Innate differences in the political, socioeconomic, and cultural levels

COFCOR continues to be committed to improving the relations of the Caribbean and its relationship with non-Caribbean Community States, regional blocs and groups, international organizations, and other trading partners who can benefit the region.

## The Way Forward

For the last few years, the Caribbean has been working assiduously on deriving a common position on foreign relations given its smallness and unique characteristics. As part of these discussions arose the issues of foreign policy priorities, relationship with Latin America, and ways to address imminent social, political, and economic challenges given the changing global environment. Moreover, the Caribbean is witnessing a changing relationship with its traditional trading partners such as the USA, Canada, and Europe. These countries have altered their priorities in a time of austerity and global economic downturns. This has led to a greater thrust and emphasis on the Caribbean to better dialogue on shared interests and common agenda.

Given this changing global environment, it is crucial that the Caribbean begin to understand

how it can rebalance its relationships and take action in its best interest given the new geopolitical context. But this situation is not unique to the Caribbean region, and as such many countries worldwide must respond to new global challenges such as changing economic powers, "new" foreign policy issues, emerging economies, and diminishing socioeconomic opportunities. This has proven to be challenging for efforts to coordinate foreign policy regionally and also costly for small nations as they seek to protect themselves and their interests.

At this juncture, it is important for the Caribbean to adopt an approach toward its foreign policy based on prioritizing its interests. Put another way, the Caribbean should have a different order of priorities. For many years, scholars have debated the sacrosanct nature of sovereignty of these states, the continued focus on mono-crop, tourism and rum, and development assistance and aid. The region must seek to develop alternative sources of revenue and forms of self-sufficiency/sustainability. If not the cycle of dependency and exploitation would continue to perpetrate and exist. As a region, the time has come to challenge these states to revolutionize their fate and confront the predetermined system.

Consequently, for the Caribbean there exist opportunities and challenges for improving trading opportunities and overcoming socioeconomic challenges. Within the global forums such as the IMF, G20, and UN, Caribbean leaders must position themselves to be decision-makers and work collaboratively to ensure positive impacts for their economies. As a region, it is essential for the region to recognize its significance, uniqueness, and potential to be powerful players within these negotiating sessions. With waning sympathy for less developed countries, it is vital that the Caribbean revisit this area. The Caribbean must be more proactive and be seen as astute and knowledgeable to make decisions and influence these processes.

For the Caribbean region, it must seek to develop solutions to their own problems and not import ideas that are ahistorical and accultural to its context. Also, the region must draw and encourage its people both abroad and locally who have the skills to facilitate this growth. Without these factors in place, then how can the most powerful countries globally be cognizant of the concerns of this region? Perhaps, the region must also focus on finding relevant global partners to harness mutually beneficial interests. In this regard, the Caribbean Community must explore initiatives at both the regional and international levels that can increase its visibility and power to be a global trading partner (Chami 2014).

# Foreign Students' Health Service Access Barriers

Vincent Ekow Arkorful

Department of Government and International Studies, Hong Kong Baptist University, Kowloon Tong, Hong Kong

## Synonyms

China; Foreign students; Healthcare barriers; Healthcare service access; Student's health

## Definition

Health service barriers refers to the factors that impede population wide healthcare access.

## Introduction

The reformation policy path charted by the People's Republic of China in the recent years has subsequently thrusted China unto the global development landscape. In essence, the inception of these policy transformations has brought along ripple benefits in many sectors of the Chinese society. One of the sectors which has yielded immense benefits has been the education sector. And because this has been the case, education has been a major contributor to national economic development. Against the backdrop of an increasing improvement in global education, part of the considerations to facilitate China's entry into the global education sphere has led to the continuous implementation of a concatenation of measures targeted at promoting quality assurance, meeting international criterion of global education systems, while maintaining global relevance in so far as teaching and research is concerned (Ministry of Education 2010).

China is increasingly becoming the study destination for hordes of foreign students around the world, particularly those of developing countries extractions. The presence of these students has resultantly, altogether, significantly increased growth in international collaboration-driven research productions. In recounting the benefits that Beijing's reformation has engendered, it is instructive to emphasize that, Internationalization of education is at the heart of the Chinese government's education policy. Precisely, internationalization of education, for teaching and research, have become critical objectives in raising quality levels, ensuring global relevance, pushing the frontiers of knowledge through research and promoting internal diversity, while attracting best students. The realization of these objectives is considered by the Chinese governments as a conduit to deliver on national priorities and contribute to global education (CUCAS 2012; CSC 2012).

In order to maintain a high standard of teaching and research, catering to the needs of domestic and international students, and resolving global research challenges, significant and continuing investment in education is required. This has spurred massive expansions and investment in the Chinese education system over the past few decades. The education sector has characteristics similar to other industries in having a sizeable portion of demand that is both domestic and international. The international component is given a growing prominence by increasing international student numbers. To justify claims that an institution provides a true international education, and to attract top students from around the world, it is necessary to clearly demonstrate a strong physical global footprint and a sizeable body of international students' opportunities for exchange and overseas study (Zhao 2011).

Over the years, there has been an influx of foreign students to China. This phenomenon has been influenced by a plethora of factors including, but not limited to; the quality of Chinese education, socioeconomic development, advancements in science and technology, as well as the introduction of a wide range of scholarship schemes for foreign students like the Chinese government's One-belt-one-road, Alliance of International Science Organizations (ANSO), Ministry of Commerce of People's Republic of China (MOFCOM), University, and other provincial scholarships. The inception of these sponsorship schemes has influenced the third position of China among foreign students hosting countries, with a population of 489,200 foreign students (Project Atlas Infographics 2018). The UK and the USA is placed second and third, hosting 506,480 and 1,094,792 foreign students, respectively (Project Atlas Infographics 2018). For some time now, Chinese Universities are experiencing a more complex and diverse student population. Generally, the population of international students in China, predominantly made up of students from both developed and developing countries across Asia, Africa, Europe as well as America, move in search of higher education opportunities.

Research on the movements of populations around the world documents public health

challenges. Exposure to healthcare challenges impacts the general well-being of populations and subpopulations. For this reason, such populations may experience limitations in healthcare access, as well as engagement in health seeking behaviors. These challenges could be precipitated by a combination of social relegations, poverty, and a dearth of knowledge regarding available healthcare services and opportunities (Magalhaes et al. 2010).

The urgency to alleviate the restriction brought about by these barriers has essentially brought about the implementation of a wide range of policies targeted at enhancing the healthcare needs of heterogeneous populations. In the USA, precisely, a framework was incepted in the year 2000, by the office of minority health (The Office of Minority Health. 2013). The framework entreats and enjoins healthcare service delivery structures to dispense culturally relevant healthcare to serve the needs of all populations in terms of meeting their respective sociodemographic characteristics, and at the same time ensuring effectiveness, efficiency, and access to excellent healthcare.

The Anhui province, with Hefei as the capital city has been touted as one of the most important strongholds of education and science and technology in China. Anhui, an integral part of China's science and technology advancements is located in eastern China, on the Yangtze River Delta. The province lies 570 km from south to the north, and 450 km to the west, occupying an area of 140.1 thousand square km, representing 1.45% of the total area of China. The province has over the years maintained a considerable strength in science and technology. In the year 2018, the province was home to five national scientific research facilities. It is also home to 26 national key laboratories, 152 key provincial laboratories, and 10 provincial level laboratories. Engineering and technology research centers numbered 753, with 44 being of national significance. Moreover, there are also 19 new high technological industrial zones, and 5403 high-tech enterprises, with 1432 other newly verified in the year 2018 (Peoples Government of Anhui 2020).

The province has accelerated the development of its education sector. Impressive achievements of scientific and technological innovation have been obtained. The launch of the comprehensive research facility for the key systems of the fusion reactor main engine marks a new major achievement in the construction of Hefei Comprehensive National Science Center. Anhui's enviable position as a fort of education, science, and technology has crated many opportunities, and made it a destination for many foreign students. At the end of 2018, there were 63,464 postgraduate students studying in the graduate schools of the province's 21 universities (Peoples Government of Anhui 2020).

Several higher education institutions (HEIs) in the province have substantial number of foreign students studying and undertaking seminal research works across various disciplines. Prior research on foreign students has mainly focused on the cross-cultural assimilation and interaction, as well as their experiences with the education system (Wen et al. 2018). Nonetheless, the healthcare issues of these populations have not attracted much attention, though there is anecdotal evidence of foreign student's healthcare barriers dominating discourses on student's social media platforms like "Wechat" (*"Wechat"* is a social media messaging application). While this remains the case, students find themselves restrained in seeking for healthcare. For this reason, most students engage in negative health behaviors.

On account of the growing collective global movement toward universal health coverage, premised on providing a comprehensive, affordable, and unimpeded healthcare service for all populations including students, there is the need to understand challenges that these populations encounter. Nonetheless, there is a dearth of studies interrogating the exact barriers faced, though international students constitute a segment of the entire student population in China. Generally, most of these students are from poor developing countries. And it is on account of their general poor backgrounds that most of them are offered financial support to undertake further studies in China. Given the general background similarities of these populations, it is possible that they encounter common, if not same set of barriers. In this context, and particularly within the context

of universal health coverage, our study explored healthcare service access among foreign students. (The use of the term *"foreign students"* represents non-Chinese nationals and/or citizens of other countries who have crossed borders to study in China.) In this study, we argue that, the resolution of these challenges would enhance and expedite the realization of the goal of universal health coverage. The study hopes to contribute to education and public healthcare literature by exploring healthcare hurdles of foreign students, and help identify sustainable mechanisms to advance their healthiness and overall well-being.

## Methodology

### Research Approach and Design

The study set out to explore foreign student's healthcare service access barriers. A qualitative approach was employed to gain insights into the complex web of multifaceted challenges of students in the Anhui province. Qualitative approach aids in providing insights regarding individuals understanding and experiences (Thomas et al. 2018). To this end, given the context-specific nature of the study, the inductive and interpretivist approach was used (Madill et al. 2000). The epistemological component of interpretivism emphasizes on knowledge subjectivity, while the ontological focuses on the variants of individual experiences. Complementing these within the context of a qualitative study approach helps in understanding the shared lived experiences of study participants, while gaining a much deeper peep into the subject matter under investigation (Zikmund et al. 2013). On this score, we employed a qualitative phenomenological approach, predicated on interpretivism and inductive reasoning. Also, the study used the thematic approach of analysis to present themes captured in participants' responses and interview transcripts regarding healthcare service access and barriers.

### Population and Sampling

Our target population included foreign students studying in HEIs in China, precisely in the Anhui province. Study participants were heterogeneous in character. Essentially, study participants were drawn from different countries in various HEIs. Participants were diverse in age (ranging from 18–45), gender, Chinese language proficiency, number of years of stay in china, and marital status. The study inclines itself to a purposive sampling design, rather than a random sampling of participants. This was informed by the need to solicit participation for respondent-driven studies where there is ample evidence of dearth of records (Salganik and Heckathorn 2004). For the purposes of sampling participants for the study, inclusion and exclusion criteria were employed. An Inclusion criterion was limited to the following:

- Must be a foreigner
- Must be a student in a university located in the province
- Must have accessed healthcare service in the province
- Must be willing to participate

An exclusion criterion on the other hand was limited to the following:

- Non-foreign students
- Foreign students studying outside the province
- Students who have not accessed healthcare service in the province
- Reluctant student participants

Foreign students were recruited from 15 August–29 October 2020. Communication and data collection timelines are presented in Fig. 1. Sampling for the study was maintained until a point of saturation was reached. Saturation refers to the point where additional information elicited from participants does not contribute new information to already drawn responses.

**Foreign Students' Health Service Access Barriers, Fig. 1** Communication and data collection timelines

### Data Collection

A semi-structured interview guide was used for gathering in-depth insights into the issue of foreign student's healthcare service access barriers. Before data collection, initial contact with leaders of student associations in the various HEIs was established. These contacts who served as gatekeepers helped in introducing the researchers and the study to participants (Given 2008). These leaders shared information about the study on Wechat social media group platforms after which people who were willing to participate in the study were recruited. Study participants were subsequently contacted and asked to consent to participation and interview, which were willingly given. Prior to interview, participants were provided with printed copies of the study overview. Participants were assured of anonymity, confidentiality, and privacy of information provided. Whereas participants were interviewed once, they were informed of their liberty to withdraw at any stage of data collection. In accordance with the recommendations of McCracken (1988), long interview sessions lasting approximately 35 min were maintained because the study sought to gather detailed information for the study. Considering the scattered location of participants within the study area, for convenience reasons, three focus group discussions were conducted via Wechat. Actually, these in-depth interviews enhanced the categorization of participant's responses, while also providing a framework for thematic analysis. To establish the credibility of the interview guide, two postdoctoral research students, and other two researchers with research interest in qualitative health studies were consulted to review the interview guide. The interview guide was subjected to three rounds of pilot tests. The first pilot test was conducted among a sample of ten researchers. The second and third pilot were conducted among 15 randomly sampled participants. After the final pilot, the refined interview guide was adopted for the study. To establish friendship with participants, teaser tour questions were asked about health. Precisely, participants were asked about their healthcare and service experience in China. Some of the questions posed included: "what are your views about healthcare and service access in China? What are some of the challenges encountered? etc. To delve deeper, probing questions like: "could you explain further?", "could you cite some practical instances or examples?" were asked. Interviews were held in the English language because it is a common language among international students. Given the diverse backgrounds of participants, the research team gathered information about the sociocultural, religious, and communication ethics of their background. To enhance cooperation and help gather accurate information, this information provided by the gatekeeper contacts informed the training of interviewers.

### Coding of Interview Data and Analysis

Interviews were recorded, transcribed verbatim, entered into Microsoft word pro 16, and finally saved separately in a collection of dropbox folders and password-safeguarded Google Drive. Participant's responses were analyzed using thematic analysis. Thematic analysis helps in identifying, interrogating, and presenting themes and patterns within the context of data (Braun and Clarke 2006). Participant's responses were analyzed to come up with categories, patterns, and themes. The transcripts were compared with audio-recorded interviews to confirm their precision. After the research team got themselves familiar with the data, initial coding was done. Afterward, substantive themes were identified. Themes were revised to contain emerging ideas. Based on this, final themes were developed. Data content were interrogated to identify the frequency of themes. The research theme developed a conceptual map designating major themes and subthemes based on their correlations, to represent findings captured in Microsoft word pro 16. Data analysis prioritized thoroughness, honesty, and integrity of data. Data was well treated and handled to avoid the integration of deviant patterns like anecdotes shared by participants. Furthermore, attention was assigned to maintain transparency and representativeness of participant's experiences. For this reason, the research did not report responses that were not captured in participant's narratives. Interview transcripts were validated from each participant to avoid misrepresentation.

Analysis of the interview was conducted by the third and fourth authors who were not part of the interview team. A brief meeting was held to ensure that findings are in order, to resolve discrepancies. The few deviant themes that emerged were keenly contested, after which a consensus was reached to delete them. The themes were further refined until they represented the perspectives of the majority of participants. This contributed to grounding results in reliability and clarity (Richards 2009), and fairness, while at the same time ensuring that results are devoid of bias.

## Results

### Background Information of Participants

The participants interviewed for this study included 33 foreign students. Precisely, participants included nationals from Pakistan, Jamaica, Poland, Azerbaijan, Russia, Ghana, Kenya, Rwanda, Cameroon, Tanzania, Malawi, Palestine, North Korean, Indonesia, Laos, Sierra Leone, Bangladesh, Cape Verde, and India. Males included 23 and females 10. In terms of age distribution, majority of participants were in the range of 26–33. Regarding marital status, majority were single. Also, Christians constituted the largest population of the study. Most of the study participants were postgraduate master's students. Most study participants could not speak the Chinese language. Most of the student participants had also stayed in China for 2–3 years (Table 1).

### Foreign Student's Healthcare Service Access Barriers

Interaction with study participants revealed a plethora of healthcare service access barriers. These factors included: Communication challenges, health education/literacy constraints, and Health Insurance challenges. These barriers are thematically discussed below.

**Foreign Students' Health Service Access Barriers, Table 1** Background characteristics of the study participants

| Variable | Category | Frequency (n) | Percentage (%) |
|---|---|---|---|
| Gender | Male | 23 | 70 |
| | Female | 10 | 30 |
| Age | 18–25 | 9 | 27 |
| | 26–33 | 13 | 40 |
| | 34–40 | 7 | 21 |
| | 40+ | 4 | 12 |
| Marital status | Single | 19 | 58 |
| | Married | 11 | 33 |
| | Divorce | 2 | 6 |
| | Widowed | 1 | 3 |
| Religion | Muslims | 9 | 27 |
| | Christians | 18 | 55 |
| | Others | 6 | 18 |
| Level of education | Undergraduate | 9 | 28 |
| | Postgraduate masters | 15 | 45 |
| | Doctoral | 6 | 18 |
| | Post-doctoral | 3 | 9 |
| Chinese proficiency | Advanced | 2 | 6 |
| | Intermediate | 8 | 24 |
| | None | 23 | 70 |
| Number of years in China | <2 years | 9 | 28 |
| | 2–3 years | 10 | 30 |
| | 3–4 years | 8 | 24 |
| | 5 years and above | 6 | 18 |

### Communication Challenges

Study participants reported communication as one of the major healthcare services barriers encountered. According to participants, majority of health personnel in most health facilities have challenges communicating with foreigners in the English language. Also, the inability of many of these foreign students to express themselves in the Mandarin language, adversely affects their healthcare seeking behavior. These concerns resonated with others shared during focus group discussions. In sharing their perspectives, some indicated that:

> On almost all the occasions I sought for medical treatment, I always come home more disturbed than I went. I Couldn't get along with the health personnel. They cannot speak English, and I can't also speak Mandarin.

> Frankly speaking, language is a big problem for not only me, but for almost all foreigners I know. The Chinese language is very difficult. I have been here for more than 3 years, but I cannot speak. I studied the language for a while, yet I cannot speak.

And because of this being the situation, participants expressed the view that they neither receive quality care, nor get value for money paid for healthcare. Most participants also reiterated that the communication gap essentially affects medication because they are unable to communicate effectively with medical practitioners. On this, some participants said that:

> I have the feeling that, I don't get value for the money spent at the hospital, because if we cannot communicate, how do practitioners understand our problem and offer good medication?

> I think the communication problem somehow affects diagnosis. I remember I once visited the hospital a while ago. After finishing the entire dosage, I never saw improvement. I still experience occasional headaches. Am sure, the health personnel did not understand me well enough.

Going forward, the study revealed communication challenges to be multifaceted and much deeper than initially revealed. Some participants expressed worry about the effects this phenomenon has on pursuing health-related activities such as making online appointments to meet medical specialist or other health personnel. Whereas some participants shed light on how their inability affects acquisition of health information and knowledge, some also expressed worry about their inability to locate appropriate departments in some health centers. This view of most study participants was attributed to the predominant use of Chinese in health communication. In this regard, some participants recounted that:

> For convenience reasons, patients are required to make online appointment in some facilities before seeing a medical practitioner. And the online system is in Chinese. How do we foreigners use? We are left out, and we don't feel the healthcare system.

> All labeling in the hospitals are in Chinese. I understand some few hospitals have English, but the truth is, they are in the minority. Because of this, one has to spend some time asking around to be directed to the right department. This even depends on when you are lucky to meet one in a million who could speak English.

### Health Education/Literacy Constraints

Against the backdrop of the communication challenges, most participants also indicated how this situation has consequently impacted their health literacy. Participants shared the view that their dearth of Mandarin knowledge, for which reason they can neither read, write, nor communicate, limits their health-related information. While these concerns dominated individual interview sessions, it also became topical during focus group discussions. In the assessment of participants, it was obvious that the situation whereby contents of medical instructions are issued in Chinese substantially affects their health literacy. In citing specific instances, participants were unanimous to cite prescription drug labels, medical consent form, laboratory reports, among others. In sharing experiences, some participants recounted that:

> For me, it's been difficult for me understanding medical contents. They are always issued in Chinese, and I don't have any knowledge in the Chinese language.

> There was a time I wanted to visit the hospital. That was somewhere around the Chinese year and I was told not all departments would be working. I accessed the hospital website to see if the

> department I intend visiting would work. To my surprise, all contents were in Chinese.

Another stressed that:

> I had to undergo surgery last year. I had to sign some consent forms. All the forms were in Chinese and I signed without understanding them. I was asked to sign, and I also signed without knowing the consequences. And because my situation was deteriorating, I thought that was not the time to be rigid.

### Health Insurance Challenges

Study participants also shared some perspectives on the health insurance scheme as one of the healthcare- and service-related challenges. Our interaction revealed that, health insurance subscription for students in China is compulsory. As such, all students are enrolled on one insurance package or the other. This was common among self-finance students, as well as others on both partial and fully sponsored scholarship schemes. In the case of students on fully supported scholarship schemes (either offered by university, Chinese government, or any awarding institution, inside or outside China), their insurance packages are fully catered for by the awarding institutions. However, with the self-finance students who bear the entire cost of insurance payments, it became apparent that they had some form of challenges. In sharing experiences, some self-finance student said that:

> I know the health insurance is good for our own wellbeing here, yet I think the amount paid is too much for us. We are students here, we don't work. We pay our fees, feed ourselves, pay accommodation and take care of other things. Adding these to 800-yuan annual health insurance payment is too high for us.

> After renewing this health insurance at a cost of 800-yuan, most people end up not using it. The money is too much for us. We cannot work here as foreign students because it's illegal to work with student visa. How do we pay for this, and other fees?

On the other breadth, some students also expressed their difficulty regarding how the health insurance system operates. This challenge permeated the experiences of both self-finance and fully sponsored students. These experiences bordered on seeking for refund from insurance scheme operators after spending on health. Specifically, participants pointed out the dearth of clarity regarding the threshold of health expenditure at which health insurance enrollees qualify for refund. Some participants recounted their ill experience with insurance operators, and indicated how they were denied refund. On this, some participants said that:

> Personally, I don't know how this health insurance thing operates. There was a time submitted receipts for refund, and I was told I don't qualify for refund because I had not spent to a certain level. What is this?

> I pre financed my health at the hospital. I submitted the receipts, and I was refunded less than five percent of what I spent. I was shocked. I still don't understand the policy.

### Coping Mechanisms

After tapping into the lived experiences, to enhance further interrogation of the sensitive subject matter under investigation, and help delve deep into the varying perspectives of participants, the study explored how participants coped with these challenges. These coping mechanisms are discussed with consistency on the following themes: Translator applications and use of communication assistants, social network recommendations, and traveling back to home country.

### Translator Applications and Communication Assistant's Use

To overcome communication challenges, study participants cited an array of alternatives ranging from using translator applications and seeking help from other friends proficient in both English and Mandarin to help them communicate with health personnel. In using translator applications, participants expressed some challenges like wrong translations. In the views of participants, this limits them in effectively conveying their problems. Some participants said the following:

> In overcoming the barriers posed by language, I use Baidu and Pleco translator applications. Mostly some of these apps give wrong translations. It's not hundred percent accurate most of the time, so I think it's not reliable.

Others indicated that, in seeking for healthcare, they seek help from friends who could speak English and Mandarin language. Nonetheless, participants expressed concern about issues of privacy with these friends. Whereas some raised worry about the possibility of their medical conditions being made public, a host of others were concerned about the capability of these friends to communicate exactly what medical practitioners communicated. Some participants said that:

> In the presence of these friends, imagine if the same person decides to expose your serious medical situation to others. Even though this option helps, I also think it's not secure because it ends up depriving me of privacy.

> These people who help us communicate with medical experts have no idea about health practice. How could they exactly convey message to us? It's obvious they would misunderstand, miss some things and end up miscommunicating to us.

Some participants also stated that, the presence of third-party communication facilitators restricts patients from opening up on private medical issues to health practitioners. On this, a participant said that:

> When I go with friends to help me, I feel restrained opening up on certain things to the medical experts. I fear my friends would one day expose it to the public one day.

### Social Network Recommendations

Some participants also stated that, given the high cost of medical expenditure, their inability to communicate effectively with health practitioners, the uncertainty surrounding refund of medical expenditures by health insurance authorities, and other difficulties, they have identified alternatives to countervail high medical bills. Some participants indicated that, they sometimes contact friends and share their ill health experiences with them, and whenever it happened that these friends have experienced the same in the past and have been successfully treated for their ailment, they recommend medications for them. Some stated that:

> During ill health moments, I do contact friends, share my feeling with them, and if they have experienced same in the past, they recommend drugs for me to buy. I would say this has been working.

Others also emphasized that they either contact friends in the medical schools who do either recommend some drugs for them, or take medical recommendations from within their friendship networks for them. A participant stated that:

> I have some friends in the medical school. When I have health problem, I tell them my problem and they help me directly or consult other medical practitioners they know, get recommendations for me to buy and use.

Some participants also emphasized that some of their friends have first aid box, with basic medicines for treating common ailments like headache, cold, bodily pains, etc. In sharing experience, some stated that:

> Some of my friends and neighbours have medicines in their room. When I have any health challenge, I go to them for medication.

Other participants further emphasized that, in situations when they have been unable to pay for the huge medical bills or buy medications to treat ailments, they resort to exploring other treatment options. Most participants expressed confidence in the efficacy of their home country medication. For reasons of communication challenges, medication efficacy, and affordability reasons, some import medicines from their home country to China. A participant explained:

> The medicine in my country is cheap and very good. Why should I spend huge money? Pakistan to China is not far, so I ask my family to send me local medicine.

*Another said:*

> Almost every month, people travel from my country to China. I take advantage of that, and get medicine. Now I have medicines and it's very good. Whenever I am ill, I boil them and drink. For a while, I get better.

### Traveling Back to Home Country

Some participants also stated that, after series of unsuccessful medication, they return to their home country to seek for medical treatment. Others also stated that, when they find themselves

in a situation where their treatment requires huge sums, they also travel back home for treatment. Through our interaction, it became apparent that, the decision to travel back home was mostly necessitated by the perceived high cost of health expenditures, as well as the communication challenges encountered by participants. On this, some participants said that:

> When I became unsuccessful in treating my ailment, I travelled back to Jamaica. When I got well, I came back. I have since not experienced the ailment again. I now feel better compared to when I was here.

> After spending huge money on healthcare and realizing I was not getting well, I went back home. I was spending much, yet wasn't seeing improvement. Now I am ok.

> When I went home for treatment and came back, I have seen improvement. A country mate of mine had some health challenges, he was spending much without any progress. I advised him to go back home and now he's back, and looking very healthy and fit.

### Study Participants-Generated Remedies to Overcome Barriers

To provide guidelines for deploying health and social policy mechanisms targeted at addressing the challenges saddling foreign student's healthcare and service access, the study probed participants to share perspectives. This was to help generate participant-centered solutions – one that would be representative of participant's opinions. Participant's made insightful contributions in this regard. Some participants expressed the view that, to countervail the issue of communication, they hoped to see an improvement in the English communication skills of most health practitioners in China. As a participant stated, while these would be good patients, it would generally inure to the benefit of global healthcare:

> An improvement in English speaking capabilities of health personnel will help advance healthcare to all class of foreigners here.

> Medical experts' ability to communicate in English would help patients to have their privacy too.

Others were also of the opinion that a change in health communication to include English could also help foreigners to easily identify departments, and at the same time understand basic medical instructions without struggles. A participant said:

> The inclusion of English in health sector communication would help jump a huge hurdle. There wouldn't be any need for interpreters and use of translators.

Others were also of the view that health facilities should strengthen communication. By so doing, health entities should consider engaging people with English proficiency to facilitate communication between health practitioners and foreign patients. Some said that:

> Health institutions should engage communicators with English speaking capabilities to help foreign students communicate with health personnel.

Most participants were also of the view that medical practitioners should get themselves conversant with dynamics such the emotional, psychological, and cultural backgrounds of patients. In pursuit of this, participants suggested the provision of specific training modules that would shed light on these and other issues like disease prevalence among foreigners to health personnel. The presence of health professionals with this knowledge would help remove or mitigate the consequences of these challenges. Some participants said the following:

> I think much of the problem with healthcare in china is that, they don't understand much about our cultural backgrounds and the prevalent ailments among foreigners.

> I think medical experts should be educated on the health conditions of foreigners. They have little idea about our system. That's what I think. Maybe a little education would help them.

> There is a time I felt bitterness in my mouth for almost a week. It was abnormal for me, so I decided to visit the hospital. I thought it was malaria fever, but the doctor said there was nothing wrong with me. Meanwhile I knew I was sick. These are some of the things.

> Medical practitioners should be a source of emotional support and empathy for patients. I think Chinese medical experts are too professionally straight and rigid. They hardly cuddle patients' emotions.

Relative to the health insurance scheme challenges, some participants suggested a review of the premium payments to make it affordable for all class of people, particularly self-finance students. Others also expressed the view that the review should take into consideration, a reduction of the health expenditure threshold to a reasonable level that would guarantee students a refund. A participant echoed that:

> The health insurance premium should be reduced and made affordable for we self-finance students. It is too much for us to pay.

Another said that:

> Whiles suggesting for a reduction of the premium, let me also call for a reduction in the threshold at which one qualifies for refund. That would save us a great amount of money.

## Discussion of Findings

Healthcare service access issues have over the years gained prominent attention within global development goals precincts, as global disease burdens assume changing forms from time to time. The effort to enhance access to affordable healthcare without encountering impediments is amplified in the Sustainable Development Goals, precisely goal 3: Universal Health Coverage. Situating the discourse of foreign student's healthcare service access barriers within global goals framework underscores the relevance of our study. To the best of the knowledge of the authors, this study is one of the few investigating healthcare service access barriers of foreign students in China. Significantly, this would help in developing health and social policy interventions toward addressing these challenges. Our study unearths in detail, interesting findings regarding barriers, coping mechanisms, and the way forward to alleviate or mitigate the effects of the challenges delineated.

Our study revealed language as a formidable barrier to healthcare service for foreign students. And because this has been the situation, foreign students are constrained in engaging health practitioners. Moreover, communication challenges also impair foreign student efforts to engage in health seeking behaviors like making appointment, locating health facilities, and departments within facilities. In the views of participants, the combined effects of these results in waste of time. Furthermore, the general dearth of foreign students' Mandarin proficiency was also revealed by this study to further compound their situation, as they encounter difficulties in acquiring online health knowledge and information from health facilities.

Participants were of the view that, in addition to the fact that communication hurdles bar their access to quality healthcare and getting value for health expenditures, the situation exerts some negative impacts on diagnosis. In an American study among Asian Americans, Mayeno and Hirota (1994), corroborate language as barriers to healthcare service. Also, Green et al. (2005) confirms the restrain that language places on health seekers in asking about their health. Arkorful et al. (2020) also confirm the significance of an effective health practitioner–patient communication to facilitate not only patient healthcare, but also treatment and overall therapy. These studies underscore general communication as not only a standard of measuring adjustment, but also, a sine qua non to environmental fitness and healthcare service access.

The study also revealed another dimension of foreign student's healthcare service barrier precipitated by participants' Mandarin language proficiency. This bordered on foreign students' health education and literacy. Health literacy within the context of this study revolves around the capability of foreign students to read, and understand health-related contents. Our interaction revealed a general paucity of foreign students' inability to peruse health contents like medical prescription, drug labels, and health information fliers. Others

also indicated difficulties related to understanding medical consent forms and other medical instructions issued by practitioners. The relevance of language to enhance health seekers information access, analysis, and subsequent decision making within health contexts is confirmed by Sullivan and Glassman (2007).

Moreover, our study revealed the state of health insurance policy as another barrier to healthcare service access among foreign students in China. Though participants acknowledge health insurance enrolment as a significant protective mechanism, they nonetheless pointed out some policy flaws. Among self-finance students in particular, considering fulfilling other obligations like tuition fees, rent, and resident permit renewal payment, among other personal care expenses, the annual health insurance premium payment, in their view was too expensive. Others also expressed concerns about reimbursement issues. While a section of the study participants called for the need for health insurance scheme operators to make health insurance packages affordable for students, others also entreated stakeholders to review the threshold that qualifies enrollees who have prefinanced their health expenditure to qualify to refund claims. In a study of rural and urban health insurance schemes in China, Wang et al. (2014) attributes healthcare imbalances and inaccessibility to nonaffordability of medical services.

After identifying barriers, the study went further to explore coping mechanisms deployed by participants to overcome them. Our study revealed an array of short- to medium-term alternatives employed by participants to overcome healthcare service hurdles. These options ranged from utilizing translator applications and communication assistants, resorting to medical recommendation from social networks, and traveling back to their country. Based on the responses gathered from participants, as much as these options are helpful, they are not reliable and sustainable. With regard to the use of translator applications, most participants cited the use of applications like "Baidu" and "Pleco" to translate audios and inscriptions. Some participants also indicated they rely on friends with proficiency in English and mandarin to communicate with health practitioners.

Nonetheless, participants expressed worry about the possibility and frequency of misinterpretations likely to be brought by the use of these communication channels. They equally expressed the view that the use of these applications enhances communications. It however renders communication ineffective, and also creates room for the occurrence of medical errors. This finding is consistent with Flores et al. (2012). For this and other reasons, the quality of care is not received.

Moreover, as part of measures to overcome healthcare service-related barriers, some study participants recounted resorting to medical recommendations from among and within social networks like close and distant friends. From our interaction, participant's reliance on this option was necessitated by a plethora of factors including, but not limited to, the low-quality services brought about by communications challenges between health seekers and service providers. Moreover, participants' perception about the high cost of medical care expenditures in China has also informed their decision not to seek healthcare from health institutions, but rather, engage in over the counter drug purchases to treat illness.

And quite surprisingly, the study revealed that, though all student participants were enrolled on one health insurance scheme or the other, they however still preferred relying on friends for medical recommendations and other related assistance. Majority of student participants preferred these nonconventional treatment alternatives more than consulting medical practitioners. More so, our interaction revealed that participants regarded this option as more effective and affordable. An assessment of what has actually informed the formation of this complex mix of perspectives, and further driving engagement in these negative health seeking behaviors to a point of entrenchment among the wider population of foreign students pointed to participants' discontent with the health insurance scheme. In the views of participants, though the annual premium is high, yet given the expenditure cap, enrollees who spend

either below or above a particular threshold are not entitled to benefit from refund.

This situation has significantly dissuaded participants from seeking healthcare from accredited health facilities. As a result, self-medication was revealed to be prevalent among participants. The effects of self-medication may come with some adverse health complications, which may affect participant's academic and nonacademic activities. In fact, Keefe (2010) confirms that, uninsured or inadequately insured people may resort to the use of less costly medication alternatives. In the face of the low-quality healthcare perceptions, high cost of health expenditure, and the general dissatisfaction with the health insurance scheme, few participants expressed treatment deferments until they revisited their home countries to undergo treatment. Even though this may come with risk, as the health conditions may further deteriorate to a point of near death, participants still preferred this as an option. This is because they have the perception that the healthcare system of their countries is structured to meet their healthcare needs.

Finally, on sustainable approaches to addressing foreign student's healthcare service barriers, through individual interviews and focus group discussions, the study elicited participants-centered suggestions, which are discussed below. Participants suggested making interpreter services cardinal to healthcare for foreigners. The positive results of professional interpreter services to healthcare are confirmed by Jaroensawat and Wankijcharoen (2013) in a seminal study in Thailand. In pursuit of providing interpreter services, participants suggested the provision of professional training to either interpreters, or medical communication experts, to enhance heathcare service provision to foreign students. This training, in the views of participants, should take into cognizance the cultural idiosyncrasies and peculiarities of foreigners. The efficacy of a culturally centered care with relation to healthcare promotion and quality is confirmed by (Fernandez et al. 2012).

Our study participants also suggested for a review of the student's medical insurance policy by scheme managers. Specifically, participants sought for the review to take into cognizance financial circumstance of students. With respect to this, the Ministry of Education, in concert with HEIs, may join the advocacy to call for a review of the medical insurance policy for foreign students. Health insurance as a protection policy is very cardinal to ensuring healthcare service, and inclusion for all populations and subpopulations, including foreign students. This is very cardinal to also advancing the core tenets of universal health coverage goals – which is predicated on the urgency to provide affordable primary healthcare to all, without exemptions. Affordability of health insurance for enhancing healthcare service access, while encouraging a positive health seeking behavior, is confirmed in a study by Keefe (2010).

Overall, healthcare service barriers studies on foreign students are not conclusive. Given the relevance of health to global health, these issues need to be further explored to enhance public healthcare access for students in China. These efforts will lead to richer and stronger springboard, on which to advance research and health policy agendas geared toward advancing healthcare, and general welfare of foreign students. Our study has some strengths that need to be espoused. In addition to this being the first study that explores foreign student's healthcare service access challenges, the interpolation of data with responses of foreign students who have accessed healthcare and experienced barriers makes the study unique. Our study therefore provides an appreciable depth of understanding from participants' varying perspectives, while offering countervailing mechanisms to the barriers. The study findings could serve as a benchmark for guiding multistakeholder interventions in the health sector.

We however acknowledge study limitations, given the methods. Interpreting and replicating study findings must be done with caution. Owing to the use of purposive sampling, our results should not be generalized as representative of the general population. Nonetheless, it is instructive to emphasize that the study prioritized the depth of the participant's experiences, rather than breadth. Also, the study was based on self-

reporting, thereby exposing findings to potential response and social desirability bias. These limitations however do not in any way invalidate or weaken the study findings.

## Conclusion and Implications for Policy, Practice, and Further Research

This study sought to explore healthcare service access barriers encountered by foreign students in the Anhui province of the People's Republic of China. To our knowledge, this is a premier seminal study that offers valid and reliable evidence of integrating factors that imposes healthcare access barriers to foreign students. This study opens up a new space in research on foreign student's healthcare and general well-being. Against the backdrop of the fact that many countries could not achieve most of the millennium development goals (MDGs), the findings of this study will provide insights into healthcare, and further help to realize the health-related SDG goals, thus universal health coverage. Our study revealed serious healthcare challenges encountered by foreign students. The authors of this study therefore suggest that, initiatives deployed by stakeholders to guide policy design and implementation targeted at improving healthcare service access should prioritize the findings highlighted by the study.

The findings of this study have policy, practice, and further research ramifications. The findings are significant for social policy, more especially to the global effort to improve accessibility by extending affordable healthcare to all populations through effective multifaceted policy formulation and implementation by governments and other relevant health sector stakeholders. As universal health coverage goals preoccupy global efforts, while debating global health reforms, an in-depth understanding of populations and subpopulations healthcare inaccessibility matters would be an excellent troubleshooter toward the way forward. The study findings indicate that healthcare service access barriers are influenced and induced by a confluence of factors centered on communication, health literacy, and others predicated on perceived health insurance policy lapses.

This calls for a critical and holistic restructuring of the healthcare system to cater to the needs of foreign student health seekers. Regarding the health insurance scheme, part of the way forward in advancing universal healthcare requires creating financially student user-centered schemes that eschews inaccessibility in all forms. This will be germane for ensuring a healthy human resource base, while increasing productivity. Also, our study recommends future studies in this arena to employ quantitative analysis, as well as mixed methods approach. Furthermore, a large-scale study involving foreign students in other provinces is strongly recommended.

# Formal Rulemaking in Public Administration

Sara R. Jordan
Center for Public Administration and Policy, Virginia Polytechnic University and State Institute, Blacksburg, VA, USA

## Synonyms

Administrative law judgment; Hearing; Rulemaking

## Definition

Formal rulemaking is one of three forms of administrative rulemaking in the United States: informal (notice and comment), hybrid, and formal (hearing). Formal rulemaking involves agencies holding hearings – on the record and presided over by an administrative law judge – to adjudicate a rule when that rule unduly affects the life or livelihood of a small group of individuals or organizations. Formal rulemaking does not require "notice and comment" as the hearing serves this purpose. Formal rulemaking does require most of the mechanisms of civil law procedure including cross-examination and the judgment of an administrative law judge.

Formal rulemaking is prompted when the authorizing legislation stipulates agencies are required to promulgate rules "on the record after opportunity for an agency hearing."

## Introduction

When most citizens or scholars think of rulemaking, they think of the website regulations.gov and notice and comment periods. While informal – notice and comment – rulemaking is the most common or comparatively well known; it is not the only forum through which agency directors can deliberate with the public about agency actions, such as proposed rules. Further, rulemaking as such is not the only way through which agencies make and publicize decisions; there is the matter of agency "guidance" (Anthony 1992). There are two additional, conventional mechanisms for agencies to engage with interested citizens and organizations – hybrid or regulatory negotiation (reg-neg) rulemaking and formal rulemaking.

The pervasiveness of the informal rulemaking process does not indicate that it is the only, or perhaps even best, form of rulemaking that agencies can use to deliberate with the public about the complicated decisions of regulation in today's economy. Formal rulemaking, which has gone largely by the wayside, provides a process for rulemaking that is rooted in the adversarial tradition of the courts rather than the contest of democracy. The process of "on the record" adjudication of the facts and implications of a rule provides a slower and more "expert-based," but not consequently less democratic, transparent, or accountable, path to final rules and agency action.

Both formal and informal rulemaking procedures derive their authority from the Administrative Procedure Act. The APA (5 USC sections 550–557) applies to all executive branch and independent regulatory agencies, prescribing procedures for rulemaking and judicial review, and is best known for its stipulations on the types and procedures for rulemaking, which is the "agency process for formulating, amending or repealing a rule" (5 USC 551(5)). Rules are "agency statements of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy or describing the organization, procedure, or practice requirements of an agency" (5 USC 551(4)). Some rules are of limited consequence and only alter the decisions or behavior of a small group in a minor way – rules stipulating the use and definition of artesian water versus springwater for bottling companies. Some rules, however, have significant economic and cultural consequences for the United States, its trading partners, and set, in effect, a global precedent: examples of environmental standards for pollutant emission or requirements for clinical trials of pharmaceuticals are just a few. Likewise, some rules are relatively brief and simple in their language and can be read and interpreted by laypersons easily while some rules are hundreds of pages and laden with scientific and legal language that is inaccessible to all but the most concentrated professionals. Regardless of the characteristic of the rule, it is more likely that the rule will be finalized after a period of informal (notice and comment) analysis than formal (hearing) adjudication.

## Formal Versus Informal Rulemaking Procedures

It is undeniable that the requirements for a formal rulemaking adjudication are more cumbersome than those for informal rulemaking. When the authorizing legislation that provides the basis for agency action includes the "magic words" – "on the record after opportunity for an agency hearing" – the agency must begin the process of organizing a hearing. Under the stipulations of the APA, "formal rulemaking requires an actual trial, complete with pretrial proceedings, an oral presentation of evidence before a hearing officer who cannot engage in ex parte communications, burdens of proof and persuasion, a cross-examination, proposed findings of fact and conclusions of law, and a written decision based on the hearing". Notices of hearings and requests for information are posted in the *Federal Register*; just as, in the informal rulemaking process, agencies post proposed rules and the mechanisms through which interested parties can provide information during an established timeline. In the informal rulemaking process, agency rules are posted, individuals can provide comments through the regulations.gov platform or electronic

or post mail, and agencies can collect and respond to these comments in the ways they deem fit for analysis. Importantly, in the formal rulemaking process, all submissions are documented, recorded, and, presumably, heard, while, in the informal rulemaking process, comments may be documented and recorded but perhaps not heard. One example of how informal rulemaking procedures may minimize individual's submissions being heard is that individual agencies may determine when comments are not preserved for public access and when comments do and do not merit inclusion in discussions of final rules language discussions of final rules language.

Finally, a key difference between formal and informal rulemaking is that formal rulemaking relies on the tradition of the courts, particularly recorded adversarial deliberation, to adjudicate the content of the rules, while informal rulemaking relies on the pattern of citizen deliberation with executive experts to modify content.

## A Brief History of Formal Rulemaking

Historically, formal rulemaking was viewed as a way to minimize what Felix Frankfurter described as "the danger of arbitrary conduct" by agencies. The presumptively arbitrary decisions of experts should be subject to the corrective of a hearing, whether as in a court (formal rulemaking) or in a legislative chamber (informal rulemaking). The procedures of a court hearing were judged to provide a way of throwing light upon murky decisions about issues with significant consequences for ordinary citizens' lives, such as in the case of food and drug rulemaking (Hamilton 1972).

Formal rulemaking was used in the development of agency actions subsequent to some of the most important pieces of economic legislation in the United States, such as the Interstate Commerce Act of 1887. In the Supreme Court ruling *ICC v. Louisville & Nashville Railroad Company* pertinent to ratemaking by the ICC, it was held that a full hearing by an agency required compliance with due process rights to a full hearing in court. Who should be afforded that right to a full hearing in the rulemaking process was established in cases prior to the APA heard by the Supreme Court. In these cases, *Londoner v City & County of Denver* and *BiMetallic Investment Company v. State Board of Equalization*, it was found that "where 'a relatively small number of persons is concerned, who are exceptionally affected, in each case upon individual grounds,' there is a due process 'right to a hearing,' but for actions affecting the general society, no such hearing is required". This delineation of the difference between general legislation and small group concerns paved the way for informal rulemaking to become the modal form of rulemaking action in all but the narrowest cases where, according to the will of the authorizing congress, the rights of these small groups are initiated by a call in the legislation for a hearing.

## "Peanut Butter" and Administrative Stalling

Over the decades since the APA was passed, formal rulemaking was not used as frequently as informal rulemaking. There are a number of theoretical reasons why this is (discussed below), but there are also political reasons related to instances where formal rulemaking was perceived to delay and obfuscate the process rather than shed light on administrative discretionary choices. An example often related in the literature addressing the possible problems of formal rulemaking is that of the FDA's eleven-year attempt to regulate whether "peanut butter should be 90% or 87% peanuts." The delay was not attributable only to the procedural requirements of formal rulemaking but was attributable to difference in priorities for the FDA and the administrative law court. However, this case is often brought forth in public and public administration arguments as a call for why formal rulemaking is a procedure best avoided (Yackee and Yackee 2012).

In the realm of administrative law, the demise of formal rulemaking came at the hands of the Supreme Court in their 1973 decision *United States v. Florida East Coast Railway.* In this case, which had similarities to the *Louisville & Nashville Railroad Company* case, the Supreme

Court determined that no oral cross-examination or development of submitted evidence was necessary for adjudication of agency ratemaking rules except where the authorizing statutes explicitly stated that there be a hearing "on the record." This decision "gutted formal rulemaking" but was in line with legal scholars' arguments at the time and today (Siegel 1998). Arguments are emerging for a resurrection of formal rulemaking. These theoretical and legal arguments suggest that formal rulemaking return (albeit infrequently) as a way of providing a recorded context about facts and values informing rules with significant economic and cultural effects, creating a necessary procedural delay to allow full consideration of issues, and creating opportunities for legitimating the administrative process through adversarial cross-examination.

Importantly, there are also political reasons for a return to some use of formal rulemaking: it increases ex ante oversight of agencies by citizens, thus reducing congressional oversight; and bringing agency views to the light of courts may allow citizens to peer into the process, be heard, and challenge agency assumptions (Neilson 2014).

## Why Formal Rulemaking Is Important to Public Administrators

If formal rulemaking was effectively gutted by *Florida East Coast Railway*, is only triggered by infrequent magic words, and if informal rulemaking is the accepted modal mechanism, then why should administrators be at all concerned about formal rulemaking? Further, if agency goals can be met without the hassle of either act of rulemaking, then why bother at all? Concerns about ossification and administrative delay are coupled with concerns about the legitimacy of the administrative state. Concerns about reviews of "arbitrary, capricious or abuse of discretion" agency actions under the "hard-look doctrine" persist and have led agencies to change their behavior when proposing new rules (Jordan 2000). Although this has led mostly to increases in promulgation of rules through mechanisms even less formal than notice and comment rulemaking, there is the chance that the accumulation of highly informal guidance and the rise of meaningless "Plebe" participation in notice and comment will lead to a revolt against the administrative state (Shulman 2009). One way around accusations of agency overreach or capriciousness is a return to formal or hearing style rulemaking, which drapes rulemaking in the legitimacy of the adversarial judicial process. Though necessarily time-consuming, costly, and, perhaps, cumbersome, a return to more hearing type rulemaking may temper critiques against the supposed illegitimacy of the administrative state.

## Conclusion

Formal rulemaking, also known as hearing rulemaking, relies on the legitimacy of the adversarial process to allow agencies and concerned members of the public to adjudicate the content of rules using trial-like procedures. Although this type of rulemaking is perhaps costlier and more cumbersome than the better known "notice and comment" or informal rulemaking, formal rulemaking is an invaluable tool for congress to use when delegating their authority to agencies. The opportunity to have final rules of great consequence, whether to a few or many, "on the record after opportunity for an agency hearing" is one of the avenues through which the congress and the president can ensure that the administrative state secures its legitimacy in a democratic system.

# Forms of Power

Fred C. Lunenburg
Sam Houston State University, Huntsville, TX, USA

## Definition

Power Legitimate power: is the ability to influence others is a person's ability to influence others' behavior because of the position that person holds within the organization. Legitimate or position power, as it is sometimes called, is derived from a position of authority inside the organization, often referred to as "formal authority." Those with legitimate power have the understood right to ask others to do things that are considered within the scope of their authority.

Reward power: is a person's ability to influence others' behavior by providing them with things they want to receive. These rewards can be either financial, such as pay raises or bonuses or nonfinancial, including promotions, favorable work assignments, more responsibility, new equipment, praise, and recognition.

Coercive power: is a person's ability to influence others' behavior by punishing them or by creating a perceived threat to do so. Typical organizational punishments include reprimands, undesirable work assignments, withholding key information, demotion, suspension, or dismissal. Coercive power has negative side effects and should be used with caution, because it tends to result in negative feelings toward those who use it.

Expert power: is a person's ability to influence others' behavior because of recognized knowledge, skills, or abilities. Physicians are acknowledged to have expertise, special skills, or knowledge and hence expert power. Computer specialists, tax accountants, and economists have power because of their expertise. As organizations become increasingly more technologically complex and specialized, expert power of organization members at all levels in the hierarchy becomes more important.

Referent power: is a person's ability to influence others' behavior because they like, admire, and respect the individual. Referent power develops out of admiration of another and a desire to be like that person. This helps to explain why celebrities are paid millions of dollars in endorsements. Marketing research shows that people such as Michael Jordan and Serena Williams have the power to influence your choice of athletic shoes and tennis products.

## Introduction

What comes to mind when you think of the term "power"? Does it elicit positive or negative feelings? In both research and practice, power has been described as a dirty word. Consider the Enron scandal (McLean and Elkind 2003). Certainly it is easy to think of leaders who have used power for unethical or immoral purposes (Brown 2006; Flynn 2011; Price 2009). That said, people who have power deny it; people who want power try not to look like they are seeking it; and those who are good at acquiring it are secretive about how they got it (Robbins and Judge 2014).

Great leaders have the following in common: they have a vision to achieve large-scale ideas that

they dream of accomplishing, and they have the personal power to enact it. For example, such business leaders as the late Steve Jobs of Apple Computer, Bill Gates of Microsoft, Mark Zuckerberg of Facebook, Jeff Bezos of Amazon.com, Phil Knight of Nike, and Sam Walton of Wal-Mart had strong visions of the future. They were able to transform their visions into reality, because they had acquired and used the necessary power to do so. Great leaders make things happen by utilizing personal power (Pfeffer 2011).

Power is a natural process in the fabric of organizational life (Haugaard and Clegg 2012; McClelland and Burnham 2003). Getting things done requires power. Every day, managers in public and private organizations acquire and use power to accomplish organizational goals. Given that, you need to understand how power is acquired, know how and when to use it, and be able to anticipate its probable effects. The concepts of power and leadership are closely linked. Leaders use power as a means of attaining group goals. By learning how power operates in organizations, you will be better able to use that knowledge to become a more effective leader. In its simplest terms, *power* is the ability to influence someone else.

## Sources of Power in Organizations

Where does power come from? What gives a person or group influence over others? More than 50 years ago, social scientists John French and Bertram Raven (1959) proposed five sources of power within organizations: legitimate, reward, coercive, expert, and referent. Many researchers have studied these five forms of power and searched for others (Carson et al. 1993; Finkelstein 1992; Podsakoff and Schriesheim 1985). For the most part, French and Raven's (1959) power sources remain intact.

### Legitimate Power

*Legitimate power* is a person's ability to influence others' behavior because of the position that person holds within the organization. Legitimate or position power, as it is sometimes called, is derived from a position of authority inside the organization, often referred to as "formal authority." That is, the organization has given to an individual occupying a particular position the right to influence – direct – certain other individuals. Those with legitimate power have the understood right to ask others to do things that are considered within the scope of their authority. When a manager asks an employee to work late to complete a project or to work on one task instead of another, he or she is exercising legitimate power. Managers can enhance their position power by formulating policies and procedures. For example, a manager might establish a requirement that all new hires must be approved by the said manager, thus exercising authority over hiring.

Subordinates play a major role in the exercise of legitimate power. If subordinates view the use of power as legitimate, they comply. That is, legitimate power covers a relatively narrow range of influence, and therefore, it may be inappropriate to overstep these bounds. For example, a boss may require his secretary to type a company document. However, it would be an abuse of power to ask that secretary to type his doctoral dissertation. The secretary may decide to complete the task, but doing so would not be within the scope of the boss's formal authority. Legitimate authority is a person's authority to make discretionary decisions as long as followers accept this discretion.

### Reward Power

*Reward power* is a person's ability to influence others' behavior by providing them with things they want to receive. These rewards can be either financial, such as pay raises or bonuses or nonfinancial, including promotions, favorable work assignments, more responsibility, new equipment, praise, and recognition. A manager can use reward power to influence and control employees' behavior, as long as employees value the rewards. For example, if managers offer employees what they think are rewards (a promotion with more responsibility), but the employees do not value

them (i.e., they are insecure or have family obligations that are more important to them than a promotion), then managers really do not have reward power.

Reward power can lead to better performance, as long as the employee sees a clear link between performance and rewards. To use reward power effectively, therefore, the manager should be explicit about the behavior being rewarded and should make clear the connection between the behavior and the reward. Employees also have reward power over their managers through the use of 360° feedback systems. Employee feedback affects managers' promotions and other rewards, so managers tend to behave differently toward employees after 360° feedback is introduced into the organization (Mabey 2001).

### Coercive Power

*Coercive power* is a person's ability to influence others' behavior by punishing them or by creating a perceived threat to do so. For example, employees may comply with a manager's directive because of fear or threat of punishment. Typical organizational punishments include reprimands, undesirable work assignments, withholding key information, demotion, suspension, or dismissal. Coercive power has negative side effects and should be used with caution, because it tends to result in negative feelings toward those who use it.

The availability of coercive power varies from one organization and manager to another. Most organizations now have clearly defined policies on employee treatment. Clearly defined rules and procedures that govern how coercive power is used prevent superiors from using their legitimate power (formal authority) arbitrarily and unethically. The presence of unions also can weaken coercive power considerably. One need not be in a position of authority, however, to possess coercive power. Employees also have coercive power, including the use of sarcasm and fear of rejection, to ensure that team members conform to group norms. Many organizations rely on the coercive power of team members to control employee behavior.

### Expert Power

*Expert power* is a person's ability to influence others' behavior because of recognized knowledge, skills, or abilities. Physicians are acknowledged to have expertise, special skills, or knowledge and hence expert power. Most people follow their doctor's advice. Computer specialists, tax accountants, and economists have power because of their expertise. Experts have power even when they rank low in the organization's hierarchy. As organizations become increasingly more technologically complex and specialized, expert power of organization members at all levels in the hierarchy becomes more important. Some firms deliberately include lower-level staff members with expert power in top-level decision making (Nebus 2006). Knowledge is power in today's high-tech workplaces.

Expert power is based on the extent to which followers attribute knowledge and expertise to the power holder. Experts are perceived to have expertise in well-defined functional areas but not outside them. To be granted expert power, followers must perceive the power holder to be credible, trustworthy, and relevant. Credibility is acquired by having the appropriate credentials. For example, physicians, computer specialists, and tax accountants, who have shown tangible evidence of their expertise, will be listened to closely and thereby granted expert power. These specialists may not be granted expert power in other functional areas. The person seeking expert power also must be trustworthy, that is, have a reputation for being honest. In addition to credibility and trustworthiness, a person must have relevance. For example, if physicians gave advice on political issues, it would not be relevant, and therefore the physician would not have expert power in this area.

### Referent Power

*Referent power* is a person's ability to influence others' behavior because they like, admire, and respect the individual. For example, suppose you are friends with your boss. One day, she asks you to take on a special project that you do not like. To anyone else, you would likely decline the request,

but because of your special relationship with this individual, you may do it as a favor. In this instance, your boss has power over you because of your positive relationship.

Referent power develops out of admiration of another and a desire to be like that person. This helps to explain why celebrities are paid millions of dollars in endorsements. Marketing research shows that people such as Michael Jordan and Serena Williams have the power to influence your choice of athletic shoes and tennis products (Craig and Douglas 2006). The same could be said of leaders in business firms who have a good reputation, attractive personal characteristics, or a certain level of charisma (Kudisch et al. 1995). A charismatic leader can ignite an entire organization (Tosi et al. 2004).

## Power, Influence, and Leadership

A great deal of power people have in organizations comes from the specific jobs or titles they hold. In other words, they are able to influence others because of the formal power associated with their positions. For example, there are certain powers that the president of the United States has because of the office (e.g., signing bills into law, making treaties, declaring war, etc.). These remain vested in the position and are available to anyone who holds it. When the president's term expires, they transfer to the new officeholder.

A true leader is able to influence others and modify behavior via legitimate and referent power. President Carter had a noble vision about the United States, as well as the world, but he could not coalesce groups or people to achieve his goals; the whole country suffered. Presidents Truman and Johnson used their position (or office or power) effectively and were much better able to manipulate groups and people to achieve their ends. Presidents Kennedy, Reagan, and Clinton relied on personal persuasion and were able to sway the nation as a whole, as well as Congress, business, and labor, by charisma and communication. President Roosevelt effectively used both position and personality. Presidents Bush 41 and 43 and Obama's leadership tends to coincide with the Truman-Johnson model.

Figure 1 summarizes the relationship between power, influence, and leadership. The key to this framework is that leadership as an influence process is a function of the elements of the leader's sources of power and the degree of acceptance with the interests and needs of the subordinates. In the figure, sources of power are divided into personal and organizational. Legitimate, reward, and coercive powers are organizational and are part of the leader's job. Policies and procedures prescribe them. Expert and referent powers are personal and emanate from a leader's personality.

## Research on Sources of Power

One review of several studies that examined the sources of power concluded the following (Pfeffer 1993):

1. Legitimate power can be depended on initially, but continued reliance on it may create dissatisfaction, resistance, and frustration among

**Forms of Power, Fig. 1** Sources of a leader's power

employees; if legitimate power does not coincide with expert power, there may be negative effects on productivity; and dependence on legitimate power may lead to only minimum compliance while increasing resistance.

2. Reward power can directly influence the frequency of employee-performance behaviors in the short run. Prolonged use of reward power can lead to a dependent relationship in which subordinates feel manipulated and become dissatisfied.
3. Although coercive power may lead to temporary compliance by subordinates, it produces the undesirable side effects of frustration, fear, revenge, and alienation. This in turn may lead to poor performance, dissatisfaction, and turnover.
4. Expert power is closely related to a climate of trust. A leader's influence can be internalized by subordinates; that is, when a leader uses expert power, attitudinal conformity and internalized motivation on the part of subordinates will result. This in turn requires less surveillance of employees by the leader than does reward or coercive power.
5. Referent power can lead to enthusiastic and unquestioning trust, compliance, loyalty, and commitment from subordinates. Like expert power, considerably less surveillance of employees is required.

It is possible for a person to possess all of the sources of power at the same time. In fact, the most powerful leaders – like those mentioned previously – have sources of power that include all five forms. Of the three sources of organizational power (legitimate, reward, coercive) and two sources of personal power (expert, referent), which are the most effective? Generally, the personal sources of power are more strongly related to employees' job satisfaction, organizational commitment, and performance than are the organizational power sources. One source of organizational power – coercive power – is negatively related to employee satisfaction, commitment, and job performance (Carson et al. 1993; Podsakoff and Schriesheim 1985).

Furthermore, the various sources of power are interrelated. For example, the use of coercive power by managers may reduce their referent power, and the use of coercive and reward power may lead to reduced expert power (Aguinis et al. 1994). However, managers with expert power are likely to have legitimate power because people accept their expertise as a basis for their authority. In addition, the higher a person's rank in the organization, the more legitimate power that individual possesses. This, in turn, tends to be accompanied by greater opportunities to use reward and coercive power (Huber 1981). Thus, depending on the situation, leaders may use the various sources of power together in varying combinations.

One interesting finding is the role that procedural justice may play in the sources of power used by leaders. Although the sources of power are interrelated as well as related to work outcomes, they are also mediated by employees' perceptions of social justice (Mossholder et al. 1998). What does this mean? It means that employees evaluate their perceptions concerning the fairness with which leaders use the sources of power and respond accordingly. Specifically, when employees perceive that the way leaders use the various sources of power seems fair, they respond more favorably. This research leads to a new concept of power: empowerment of organization members.

## Empowerment of Organization Members

Diane Tracy, a New York management consultant, suggests a new concept of power in her best-selling book, *The Power Pyramid*: *How to Get Power by Giving It Away* (1990). The concept has been referred to in the literature as "empowerment." The new advice is that you can achieve ultimate power by giving it to the people who work for you. Tracy says that power operates under the same principle as love: the more you give to others, the more you receive in return. Also, she suggests that leaders can maximize their own power and their opportunities for

success by enabling the employees they supervise also to achieve their own sense of power and success.

Today, many organizations are recommending a flattening of the pyramid. These leaders are beginning to see the need to involve organization members at all levels in making decisions and solving problems. Real power, according to Tracy, flows from the bottom up, rather than from the top down "... If you are successful in giving your people power, they will surely lift you on their shoulders to heights of power and success you never dreamed possible..." (Tracy 1990, 2).

Diane Tracy follows up her view of empowerment with practical suggestions on how to achieve a redistribution of power. She recommends ten steps to empowerment (Tracy 1991):

1. Tell people what their responsibilities are.
2. Give them authority equal to the responsibility assigned to them.
3. Set standards of excellence.
4. Provide them with the needed training.
5. Give them knowledge and information.
6. Provide them with feedback on their performance.
7. Recognize them for their achievements.
8. Trust them.
9. Give them permission to fail.
10. Treat them with dignity and respect.

## Conclusion

Power is the ability to influence others. One of the most influential theories of power comes from the work of French and Raven, who attempted to determine the forms of power leaders use to influence others. French and Raven identified five forms of power that can be grouped into two categories: organizational power (legitimate, reward, coercive) and personal power (expert and referent). Generally, the personal forms of power are more strongly related to employees' job satisfaction, organizational commitment, and job performance than are the organizational power forms. One form of organizational power – coercive power – is negatively related to work outcomes. However, the various forms of power should not be thought of as completely separate from each other. Sometimes leaders use them together in varying combinations depending on the situation. A new concept of power, referred to as "empowerment," has become a major strategy for improving work outcomes.

## Foundations of the Administrative Law

Andrew Osorio
School of Public Affairs and Administration, University of Kansas, Lawrence, KS, USA

### Synonyms

Administrative process(es)

### Definition

Generally speaking, administrative law is the amalgamation of public laws (i.e., constitutional provisions, legislative statutes, judicial opinions, executive directives) that addresses the democratic legitimacy, control, and performance of administrative authority and discretion by specifying the legal structures, procedures, and standards utilized by government agencies with an emphasis on the role of institutional oversight by the courts.

### Introduction

American administrative law stretches back to the beginnings of the nation when in 1789 the First Congress of the United States drafted legislation that established the War Department, the Treasury Department, and the Department of Foreign Affairs and delegated to government officials the authority to undertake a wide variety of tasks including the determination of duties on imported goods, pensions for Revolutionary War soldiers, and the award of licenses to trade with indigenous

people (see, e.g., Beermann 2011; Bertelli and Lynn 2006; Pierce 2008). In other words, it was the earliest laws of the land that breathed life into the inchoate administrative state by creating the country's original executive agencies and empowering the first handful of civil servants to implement its public policy. As such, the history of public management in the United States has been inextricably interwoven with the laws that have shaped the scope and structure as well as the principles and processes of government bureaucracy.

However, despite the deep-seated connection between the two fields, in both theory and practice, the subject of administrative law has fallen victim to the near-universal "anti-legal temper" (Waldo 1984, p. 80) among academics and practitioners of public administration. For example, despite the early work of luminaries such as Ernst Freund, W.F. Willoughby, and Frank Goodnow – widely acclaimed as the "father of public administration" (see, e.g., Bertelli and Lynn 2006; Waldo 1984) – whose work championed the importance of administrative law or the contemporary interest of a small cadre of scholars (see, e.g., Barry and Whitcomb 2005; Beckett and Koenig 2005; Cooper 2007; Lynn 2009; Moe and Gilmour 1995; Rosenbloom and O'Leary 1997), the discipline has largely hewed to the view espoused in 1926 by Leonard White in his seminal treatise *Introduction to the Study of Public Administration* that "the study of administration should start from the base of management rather than the foundation of law" (p. vii).

Given the general neglect of administrative law within the public administration literature, the goal of this brief entry is to provide an introductory overview of the field. Because a full and fair explication of the nature and importance of administrative law is beyond the scope of this endeavor, the discussion that follows will be limited to (1) an attempt to define the subject matter of administrative law, (2) a description of the sources of administrative law, and (3) an explanation of the continued and vital importance of administrative law for the study and practice of public administration. However, before proceeding one final note with regard to the scope of this entry is in order. Although administrative law exists at all levels of American government (i.e., local, state, and federal) and much of the substance is applicable regardless of the governmental setting, the context for the ensuing discussion is administrative law from the perspective of the national level of government.

## What Is Administrative Law?

At the outset, it must be noted that there are several factors that make a definitive summation of administrative law an impractical endeavor. First, although administrative law has been part of the American legal landscape from the outset, it is still a field very much in development (see Warren 2011). For example, because "administrative law today deals with central issues in our political landscape" (Breger 1991, pp. 349–350), the underlying assumptions which guide its course have been subject to regular alteration by all three branches of government (see, e.g., Kerwin 1994; Schiller 2000). Put simply, administrative law is malleable in many respects and subject to the caprice of judges, attorneys, and politicians. Second, as will be discussed below in greater detail, administrative law is a broad and eclectic field cobbled together from a variety of sources such as the Constitution, statutory law, judicial decisions, and Executive Orders issued by the president. In turn, administrative law spans myriad substantive areas such as air and water quality, immigration, labor, taxation, housing, occupational safety, and the regulation of food and drugs. In short, the "scope of administrative law is impossible to determine" (Warren 2011, p. 17). Third, because administrative law reaches across the realms of political science, public administration, and legal studies, its interpretation will also vary depending upon who is asked to define the field – an attorney is likely to give a far different answer than a public administrator (see Dimock 1980). With the above caveats in mind, it is perhaps useful to first offer a brief survey of the variety of descriptions that have been offered over the years before positing a working definition that will be relied upon for the remainder of this entry.

The original definition of American administrative law offered by Frank Goodnow in 1893 portrayed the field as "that part of the law that governs the relations of the executive and administrative authorities of government" (p. 7). In addition to the definitional hurdles described above, the vagary of Goodnow's description helped pave the way for the proliferation of competing (and at times conflicting) definitions that have ranged from narrow to broad, complex to simple, and concrete to abstract. For example, Diver (1981) posits a figurative description of administrative law as "in essence, a search for a theory of how public policy should be made" (p. 393), whereas Schuck (2004) initially offers a more concrete framing of administrative law as "the legal doctrines . . . that govern the structure, decision processes, and behavior of administrative agencies" (p. 5). Pierce (2008) supplies a middle-of-the-road institutional view of administrative law as "the study of the roles of government agencies in the U.S. legal system, including the relationships between agencies and the other institutions of government—Congress, the Judiciary, and the President" (p. 1), whereas Simon (2015) notes that legal scholarship in the area of administrative law is "largely concerned with the role of the courts" (p. 62; see also Shapiro (1988)), and Cooper (2007) offers a more expansive networked view of modern administrative law as "the law of connections . . . connections among organizations at the same level and between units at different levels . . . and the connections between domestic actions and those of regional or global international bodies" (p. 573). Others, such as Barry and Whitcomb (2005), have conceptualized administrative law in terms of the balance between "an administrator's exercise of governmental authority on the one hand, and a private party's rights in relation to governmental authority on the other" (p. 3). In its broadest terms, Breyer et al. (2011) summarize administrative law as "the legal control of government" (p. 2) while, on the opposite end of the spectrum, Rosenbloom (2015, p. 1) offers perhaps the most comprehensive, if not somewhat cumbersome, definition of administrative law as:

> the body of constitutional provisions, statutes, court decisions, executive orders, and other official directives that, first, (a) regulate the procedures agencies use in adjudicating, rulemaking, and adopting policies, (b) control the exercise of their authority to enforce laws and regulations, and (c) govern the extent to which administration is open to public scrutiny (i.e. transparent); and second, provide for review of agency decisions, rules, orders, policies, actions, and other aspects of their operations.

Taking into account Warren's (2011, p. 20) admonition that definitions of administrative law "always seem to lack something," a synthesis of the various interpretations of administrative law surveyed above, yields the following proposal for a working definition: Generally speaking, administrative law is the amalgamation of public laws concerned with the democratic legitimacy, control, and performance of administrative authority and discretion through the specification of the legal structures, procedures, and standards utilized by government agencies with an emphasis on the role of institutional oversight by the judiciary.

## The Sources of Administrative Law

Overall, there are four primary legal sources that comprise American administrative law: the US Constitution, legislative statutes, case law (i.e., the cumulative body of decisions rendered by the judiciary), and Executive Orders. This section will provide a brief explanation of each of these areas of law beginning with the largest, the Administrative Procedure Act (APA).

Signed into law in 1946 after nearly a decade of debate, the APA is the principal source of administrative law and serves as the embodiment of the core principles and processes that govern discretionary agency action (Rosenbloom and O'Leary 1997). More so than any other component of administrative law, the APA serves as the legal foundation for public administration and has drawn analogies to the US Constitution and the Magna Carta inasmuch as it creates a generalized legal framework for the modern administrative state (see Barry and Whitcomb 2005; Beermann 2011; Shapiro 1988). In brief, the

APA sets forth the procedures and criteria for agency rulemaking and adjudication; it prescribes the necessity and nature of public notice and participation; and it establishes the standards for judicial review of agency action. However, unlike other fundamental documents that establish legal regimes, the APA is not the final word on administrative law.

For instance, Rosenbloom (2015) discusses a variety of other statutes which augment, and at times supersede, the mandates of the APA. Such laws include the Freedom of Information Act, the Government in the Sunshine Act, the Federal Advisory Committee Act, and the Openness Promotes Effectiveness in our National Government Act, all of which greatly expanded the degree of governmental transparency provided for in the APA. In addition to these statutes of general applicability, the organic statutes drafted by Congress that establish agencies and outline their mission may contain supplementary rulemaking or adjudicatory requirements beyond what is prescribed in the APA. For example, several agencies, such as the Consumer Product Safety Commission, must in accordance with their enabling statutes provide additional opportunities for public participation above and beyond what is required from the APA under certain circumstances.

In addition to the statutory law described above, the president has the ability to create administrative law by imposing additional requirements upon agencies through the use of Executive Orders. As an example, in 1981 President Reagan mandated the process of centralized review for administrative regulations by the Office of Management and Budget through Executive Order 12,291. President Clinton issued Executive Order 12,866 in 1993 which outlined 12 principles for agency rulemaking including the need to assess the cost-effectiveness and cost-benefit of regulations, identify alternatives to the proposed regulation, and seek input from state, local, and tribal governments. Considering that a majority of administrations have issued hundreds (occasionally thousands) of Executive Orders, the presidency continues to exert a strong influence over the direction of the administrative state, especially in times of congressional inaction.

The US Constitution also contributes to the body of administrative law in several important respects. First, and foremost, the constitutional separation of powers allows for each branch of government to exercise authority over agencies by contributing to the development of administrative law – Congress develops legislation, the president issues Executive Orders, and the judiciary interprets the foregoing and imposes its own values on agencies through its oversight role. Second, the Constitution continues to offer doctrinal guidance through its various provisions. For example, when all other forms of law are silent, the Due Process Clause of the Fifth Amendment and the Equal Protection of the Fourteenth Amendment provide a baseline degree of protection for individuals against procedural or substantive discrimination on the part of government agencies.

Lastly, as noted above, much of administrative law focuses on the oversight of agencies by the courts (see, e.g., Shapiro 1988; Simon 2015). This special relationship was contemplated by the APA which explicitly empowers courts to review agency actions. According to APA § 706, courts are able to "hold unlawful and set aside" any informal act that is determined to be "arbitrary, capricious, an abuse of discretion or otherwise contrary to law." In so doing, courts consider the full range of public laws previously described as well as principles found within the common law – the cumulative body of law built upon past judicial decisions. Additionally, courts regularly engage in the "judicialization of administration, a process by which courts tend to shape administrative agencies in their own image and likeness" (Rohr 2002, p. 80). For instance, courts have supplemented administrative law by ruling that in order for public participation in administrative rulemaking to be meaningful, agencies must allow interested persons the opportunity to respond to opposing comments submitted by other parties, reflecting the norm of adversarial legalism inherent to the American judicial process.

## Conclusion: The Importance of Administrative Law for Public Administration

As noted in the introduction, American public administration has for much of its history largely ignored its foundation in administrative law. Although there are multiple accounts of the divorce of administrative law and public administration (see, e.g., Bertelli and Lynn 2006; Dimock 1980; Roberts 2008; Warren 2011), the divergence of these fields is perhaps most easily understood given their underlying differences in philosophy. For instance, the "entire point of standard legal scholarship is to explore and contrast the pragmatic implications of conflicting normative positions. . . . Normative conflict not only constitutes the discourse of legal scholarship, but also reflects the field's subject matter" (Rubin 1988, p. 1893). In the area of administrative law, this normative preoccupation has resulted in an emphasis on constitutional values as expressed through judicial safeguards of individual liberty and the separation of powers (see Rosenbloom and O'Leary 1997). This focus on constitutional contractarianism within administrative law has been viewed as incompatible with a mainstream public management approach that favors administrative utilitarianism, efficiency, and performance (see, e.g., Lynn 2009). Or, as explained by Rohr (2002), "participation, transparency, and accountability . . . set a tone quite different from efficiency, effectiveness, and economy, the traditional hallmarks of administrative orthodoxy" (p. 83). While the root of their separation is understandable, the neglect of administrative law has had severe consequences for public administration.

To begin with, a small but sonorous chorus of academics has observed that by ignoring its roots in administrative law and the values attendant thereto, public administration has forfeited much of its claim to democratic legitimacy and theoretical substance (see, e.g., Cooper 2007; Lynn 2009; Moe and Gilmour 1995; Reed 2009; Rohr 2002; Rosenbloom and O'Leary 1997; Szypszak 2011). As argued forcibly by Bertelli and Lynn (2006), in abandoning the foundation of administrative law during the early half of the twentieth century, "mainstream public administration was not only setting the stage for its permanent state of crisis but also conceding the power to define the scope and legitimacy of public administration to, ironically, the bar and the courts" (pp. 101–102). Moreover, the effects of neglecting administrative law are not simply pedagogical or abstract.

In practice, public administrators face a variety of legal issues on a daily basis involving matters such as personnel decisions; contract management; the proper handling of data privacy; responding to requests under the Freedom of Information Act; determining the issuance of benefits, permits, and licenses; or interpreting the applicability of statutes and court decisions (see, e.g., Roberts 2008; Szypszak 2011). Put differently, administrative agencies "exist to administer the law, and every element of their being—their structure, staffing, budget, and purpose – is the product of legal authority" (Kettl and Fesler 2005, p. 10). As such, by neglecting the reality that law permeates public administration in both theory and practice, current scholarship in the field has missed a grand opportunity to develop what Marshall Dimock deemed "a more realistic, a more complete development of public administration" (1933, p. 35).

## Synonyms

Charitable foundations; Government-nonprofit collaboration; Philanthropy; Public-philanthropic partnerships

## Definition

Regulatory and collaborative interfaces between the government and private philanthropic foundations.

## Introduction

In the American context, philanthropic foundations are typically understood as private, endowed institutions that pursue public purposes primarily through using endowment income to make grants to other charitable organizations in support of the organizations' missions, programs, or projects. While the majority of US foundations is grantmaking, some foundations also operate

their own programs or even institutions in addition to any grant programs they may have. Examples of such operating foundations include the J. Paul Getty Trust, the Kettering Foundation, or the Freedom Forum with its Newseum in Washington, D.C. For historical reasons, operating foundations are more prevalent in other parts of the world, including most of continental Europe and the Middle East, where Islamic endowments often support mosques and religious institutions, for example. However, operating foundations are, conceptually and practically, similar to other nonprofit organizations, and policy interests driving foundation/government relationships therefore focus principally on grantmaking foundations.

Over the past three decades, governments across Continental Europe have been working to improve tax and regulatory conditions for these institutions in hopes of generating private resources to supplement shrinking public budgets (Anheier and Toepler 1999), and even in the United States, where philanthropy is a long and well-established phenomenon, cooperative relationships between foundations and local, state, and federal governments have gained greater currency in recent years under the heading of public-philanthropic partnerships. As a result, foundation endowments have grown considerably in many countries. In the USA, for example, the foundation field grew from some 30,000 at the beginning of the 1990s to almost 90,000 foundations at current, and foundation grants grew from $9 billion to more than $50 billion per year during the same period. In the first decade of the 2000s, American foundations added about 10,000 new foundations and $9–10 billion in grant dollars every 5 years or so (Toepler 2017).

However, despite this recent policy interest, the role of philanthropic foundations in democratic societies has never been easy or uncontested. In France, for example, foundations remained abolished as legal institutions from the French Revolution to the late 1980s, and similarly in Sweden, the emerging welfare state treated foundations with distrust and hostility until the recent past (Toepler 2018). A similar case can be made for the USA as well. As foundation scholar Waldemar Nielsen (1972) has noted prominently in the past, exercising privately controlled power within the public sphere, foundations are essentially undemocratic institutions that are nevertheless, and somewhat paradoxically, indulged, and even privileged, within American democracy and capitalism.

Foundation/government relations are therefore potentially precarious in liberal democratic systems and differ fundamentally from the well-established collaborative partnership that exists between the nonprofit sector and government (Salamon and Toepler 2015). The latter rests on a clearly defined division of labor between the sectors, with the government providing financing and the nonprofit sector undertaking service delivery, that does not exist vis-à-vis foundations. Like the government, grantmaking foundations also engage in the financing function, and the way in which they perform this function through a range of specific roles determines to what extent the government perceives foundations as a competitive threat in the public sphere. In the following, I will first discuss the democratic dilemma underlying the relations between government and foundations, as well as key societal roles often ascribed to foundations before reviewing their historical political reception and regulation in the US context.

## Democratic Legitimacy

Grantmaking foundations are often perceived as unique institutions in that they are not subject to the constraints of resource dependency and presumably free of external control. As asset-based institutions, they are typically able to self-generate the economic resources they need for their programs and these resources are essentially unrestricted, within the bounds of the charter. As such, foundations have no external constituents – no clients, shareholders, voters, or even members – to take them to account. This lack of direct accountability provides foundations with the opportunity to be flexible and to take risk without fear of punishment. While foundations do indeed have a fairly high degree of independence, this

view neglects to consider legitimacy as a major organizational resource that foundations require to avoid political and regulatory repercussions. At issue is a basic tension inherent in the foundation form between autonomy (that is the freedom to set priorities and dispose of their means within the confines of donor intent) and the obligation to serve the public based on the tax privileges that they receive. While the basic legitimacy of foundations is rarely directly questioned, this tension remains a continuous source of legitimacy challenges (Heydemann and Toepler 2006). These challenges, however, may not be fully consequential, as Prewitt (2006) argues, because the American foundation represents a specific solution to governing private wealth within liberal society: the foundation form enables the attachment of private wealth to the pursuit of the public good with limited interference in economic-political choice and freedoms. In this then, the foundation form supports the liberal order by preempting, to a degree, government coerciveness and encroachment into the private sphere; and does so in a pluralistic contention over determining public interest. The right to establish foundations to pursue, express, or fund ideas, concepts, preferences, or values that are not in line with majority views or governmental priorities contributes to open political systems and societies and strengthens democratic development. In other words, foundations represent a publicly sanctioned mechanism for social and economic elites to perpetuate the liberal system that they benefit from, and pursue private preferences, whether altruistic or based on self-promotion or corporate strategy, within the bounds of charity.

In Prewitt's perception, foundation legitimacy is closely tied to the legitimacy of the nonprofit sector at large as an independent societal power center, which locates it within the plural model of elite theory (Farazmand 2002). Foundation donors and leaders are among various elite groups interacting on public issues. But other elite models also come to play within the foundation literature, in particular the ruling class and power elite models. The concern that foundations are instruments of the ruling class is historically rooted in the progressive era and has a long tradition of radical scholarly thought ascribing to foundations the intention to create a class of intellectuals trained to support industrial capitalism and the cultural hegemony of the business class. In their influential historical contribution, Karl and Katz (1987) question the radical view and lean more towards the plural elite model, noting a cacophony of voices between and among foundations, government, and other interest groups that makes it difficult to discern which elites manage policy. Yet, radical scholars continue to see foundations as institutions perpetuating hegemonic rule.

The power elite model takes a somewhat similar stance: Thomas Dye (2001) prominently views foundations as an instrument for the governing elite to set the issue agenda in a top-down process of public policymaking. This then draws attention to foundation governance and leadership and the role of organizational elites. Particularly by using financial leverage and developing common goals in collaborations, foundations might foster cohesion and consensus within the government (Farazmand 2002).Whatever model applies most, given their proximity to societal elites, it is imperative that foundations exercise their power in the public realm responsibly and appropriately: As Heydemann and Toepler (2006: 21) hold, "the performance and effectiveness of foundations in pursuing their social roles and functions is a powerful determinant of foundation legitimacy."

## Foundation Roles and Functions

Attempts at clarifying such social roles and functions (vis-a-vis and independently of the state) have made significant progress in recent years, and there is a wide range of possible roles available for foundations to pursue. In fact, a substantial body of literature has emerged to describe the special roles and functions that grantmaking foundations might, or might not, be expected to perform given their unique institutional characteristics (see, inter alia, Anheier and Hammack 2010; Hammack and Anheier 2013). Drawing on various recent efforts to summarize the thinking on this issue, at least three distinct roles of

foundations can be distilled from the literature, in addition to the pluralistic function noted above.

***Redistribution***. From a fiscal policy point of view, foundations may also function as a means of facilitating a voluntary redistribution of wealth, with the affluent using their wealth to support causes that may benefit the poor. Whether based on religious or moral grounds, redistributive aspects were in part underlying the evolution of the modern foundation in the USA. Writing in 1889, Andrew Carnegie (1983: 102) actively welcomed the advent of progressive estate taxation as a means to encourage the wealthy to put their resources to public uses voluntarily: "Of all forms of taxation [the graduated death duty or estate tax] seems the wisest. Men who continue hoarding great sums all their lives . . . should be made to feel that the community, in the form of the State, cannot thus be deprived of its proper share. By taxing estates heavily at death the State marks its condemnation of the selfish millionaire's unworthy life."

***Funding Intermediation***. The use of foundations as funding intermediaries in the production of collective goods and services is a related, yet distinct role. One of the principal policy interests and expectations is that the foundations increase the amount of private resources for social, educational, cultural, and other public purposes. Foundation funding in this sense can either have a substitutional or a supplementary function. Supplementary, or complementary (Anheier and Hammack 2010), funding takes place where government cannot garner sufficient public support to directly address certain issues or causes or face constitutional or other barriers to doing so. Substitutional funding, by contrast, takes place where governments attempt to cut existing subsidies in hopes that foundations and other private funders step in to fill emerging funding gaps. Traditionally, foundations prefer to provide supplementary rather than substitutional support, as foundation resources are generally too limited to support a basic financing function in most policy arenas. Another role in this context is building out. As Hammack and Anheier (2013) point out, foundations often engage in creating new institutions or enhance existing ones, bringing new capacities and opportunities to areas that lacked those before.

***Change Agency***. Apart from funding intermediation, the societal "change agent," "innovation," or "venture capital" role of foundations is probably the most recognized and widely discussed function. At a basic level, the appeal of this role lies in one unique characteristic of the foundation form: its virtual lack of dependence on outside resources (except for legitimacy in an indirect way). As hardly any writing on foundations fails to mention, whereas governments are accountable to voters; businesses to owners, shareholders, and consumers; and other nonprofit institutions to members and/or funders, there is no outside stakeholder group to which foundations are directly accountable. Accordingly, at the organizational level, foundations are not subject to sanction in cases of failure in what they do. Given this independence, foundations have therefore the capacity to act as agents of change through taking funding and programmatic risks and providing seed money for innovative projects and ideas whose outcomes are uncertain and failure-prone, but potentially highly beneficial.

Not all of these roles have equal salience, however. Redistribution, or the lack thereof, is occasionally discussed, but has little bearing conceptually on the foundation debate and is rather limited in its practical relevance. In essence, that foundations support causes, such as high culture or elite education, which may benefit the affluent more than the disenfranchised is generally acknowledged, but not perceived as a significant problem. The opposite, such as foundation investment in efforts to improve failing public school systems, on the other hand, typically raises greater concerns about "relinquishing control over the public education policy agenda to private foundations run by society's wealthiest people" (Ravitch 2010).

Funding intermediation is of greater consequence overall, although its impact on the self-perception of US foundations is also somewhat mixed. The substitution role in particular has traditionally not had much resonance in the US context at all, as evidenced by a near complete lack of a discussion of these roles in the foundation

literature or policy debate. In terms of substitution, it is the case that funders are occasionally concerned about government cut-backs or other revenue shortfalls in particular fields of activity and the prospect of having to divert resources to help secure basic funding levels. However, such concerns relate for the most part to the perceived ability of foundations to maintain other roles over the short-run, but do not reach the systemic question of whether substitution may be an acceptable (or even debatable) permanent role. At the same time, there has historically been little expectation by policy-makers that foundations would (or usefully could) step in and fill gaps left by the government's retreat from prior responsibilities. General government "exit strategies" tend to focus on creating incentives for individuals or markets to address needs rather than creating incentives for philanthropic intervention.

Supplementarity, by contrast, presents a more complex picture. In the defining early years of the ascendancy of US foundations, both the Rockefeller and Carnegie philanthropies relied heavily on working with and through public institutions, which arguably contributed to the success of their work in the first half of the twentieth century. The complementary nature of foundations was also a staple in the arguments in favor of foundations in the course of their critical examination through Congress in the 1960s. The 1965 Treasury Department assessment of the foundation field allowed for a "vital role" in "providing for areas into which government cannot or should not advance" (Treasury Department 1965: 13). Likewise, the so-called Petersen Commission suggested that a diversion of funds from the treasury (e.g., tax exemption) is "strongly justified when private philanthropic money is used, not as a substitute for tax dollars, but as a supplement of a special kind that serves the public interest in ways in which the government itself is under various operational constraints" (Commission on Foundations and Private Philanthropy 1970: 15). Since the 1970s, however, the complementarity role has largely disappeared from the foundation discourse, although it is still traceable in foundation practice, such as in the efforts of foundations to support arts education in public school systems that do not offer such programs.

The pluralism argument was a corollary to the references to the complementarity role in the 1960s and 1970s. In contrast though, it has retained a measure of relevance in the foundation discourse, primarily with reference to foundation support of the private nonprofit sector. Given the relatively small contribution of foundations to overall nonprofit sector revenues, however, the pluralism case is inherently weak (Nielsen 1972), and the proliferation of foundations may thus be seen as a sign rather than a cause of pluralism and societal openness.

While, apart from pluralism, most foundation roles are given little credence in the USA, the societal "change agent" function, that is either the innovation or the social/policy change role of foundations, is probably the most recognized and widely discussed function. The relative centrality of the change agent function to the self-identity and the external assessment of the foundation field is widely reflected in the critical discussion of foundation work. Many observers, for example, have criticized an apparent short-term focus within foundations. The trend in the field has been towards funding short-term projects and specific programs rather than committing to long-term general support of potentially highly innovative organizations. This problem has frequently been associated with the emergence of a "program officer profession." The argument is that foundations have become more risk-adverse and less innovative, because professional foundation managers prefer to fund smaller and safer programs so as not to have to take personal responsibility if larger and riskier projects fail.

## Political Criticism and Regulation in the USA

That a discussion of these roles has a long history in the USA is also a reflection of the fact that foundations from the beginning received a very critical political reception. The very first large-scale foundations emerged around 100 years ago in the Progressive Era that was marked by broad

populist and political rejection of the unfettered capitalism of the late nineteenth century. That some of the very worst of the so-called robber barons started to create new philanthropic institutions was met with great suspicion in the public as well as in Congress. John D. Rockefeller's original intention was to have his new foundation federally chartered in Washington, D.C. However, fearing that it would use its wealth to exert undue influence over politics led Congress to refuse to grant Rockefeller a federal charter. As Peter Frumkin (2008: 95) noted: "The rise of large private foundations made some in Congress uneasy as philanthropic resources threatened government's monopoly over social policy." Instead, he created the Rockefeller Foundation in New York in 1913, following Olivia Slocum Sage's (Russell Sage Foundation) and Andrew Carnegie's examples in 1909 and 1911, respectively. However, Congress remained wary and launched a congressional investigation of these new entities in 1915, although no regulatory action resulted from it.

This wariness was a result of the substantial economic means at the disposal of these new entities. To carve out a legitimate social function in response, foundation advocates early on claimed a role as "societal venture capital" for foundations and a fundamentally different agenda than the traditional focus of charitable activities on providing relief and amelioration of social issues. The new philanthropic activity was directed towards analyzing and addressing the causes of social problems rather than just addressing their effects. Using the emerging health and social sciences to tackle the "root causes of social ills" set the ambitions and operations of the early twentieth century foundations apart from earlier foundation activities in America and launched the "modern philanthropic foundation" sector (Karl and Katz 1987). The Carnegie and the Rockefeller examples popularized the foundation idea and provided a blueprint for other wealthy donors to follow in the 1920s and 1930s. High marginal tax rates during World War II and the postwar period combined with relative lax regulation further propelled foundation growth in the 1940s and 1950s. Financial planners began to promote foundations as tax planning mechanisms or as means to structure enterprise ownership and business transactions.

Congress briefly targeted foundations again during the McCarthy era during the 1950s, and then launched an almost decade long investigation of perceived economic and financial misuses of foundations during the 1960s.The political backlash culminated in the Tax Reform Act (TRA) of 1969, which imposed significant new economic regulations on foundations. Whereas neither general laws nor tax regulations had distinguished between foundations and other charities before, the TRA of 1969 singled out those "foundation-like" charitable organizations that Congress found in need of more stringent regulation and lesser tax privileges. The act also differentiated for the first time between operating and grantmaking foundations, easing for the former some of the harsher regulations imposed on the latter.

A key provision of the Act was the introduction of a payout requirement for grantmaking foundations, which forced foundations to spend a minimum level of grant dollars each year. Originally, the requirement was to pay out either all income or the equivalent of 6% of the asset value, whichever was greater. This prohibited foundations from retaining parts of their investment income to maintain the real value of their capital and forced them to draw on their assets for spending where investments yields remained below the 6% mark. Combined with the stagflation of the 1970s, this caused a decline of the US foundation sector in the following decade. In the early 1980s, the payout requirement was changed to a flat 5% of asset value, allowing foundations to retain excess income and keep giving below asset growth, which allowed the foundation field to start growing again.

Beyond the payout requirement, a number of other restrictions were imposed on foundations that are generally not applicable to other charities. The TRA of 1969 introduced an excise tax, that is a levy on income, which was to be used to fund government oversight of foundations. Self-dealing (e.g., business transactions) between foundation and donors, board members, managers, and certain other persons are generally

prohibited, even if they were to the advantage of the foundation. Foundations may not own privately held business or control public corporations, and are prohibited from engaging in any kind of political activity, including lobbying. In addition, donations to foundations have generally lower deductibility limits than donations to other charities. For example, a donor may deduct up to half of her income for gifts to charities, but only 30% for endowing a foundation. Since then, the level of political suspicion and distrust of foundations has faded, but the burst of endowment growth and the emergence of new mega-foundations, most notably the Bill and Melinda Gates Foundation, during the second half of the 1990s raised new issues and criticisms of the influence and impact of private funders on public policy.

The resulting unease has manifested itself particularly in the education field and especially the role of foundations in school reform efforts. Moving from funding local experiments to shaping national policies, a number of such foundations, including the Bill and Melinda Gates, Broad, and Walton Foundations, have led efforts to introduce market-oriented approaches based on competition, freedom of choice, and economic incentives as well as deregulation into the education policy debate. Essentially, leaving control over education policy to private foundations is, according to former Assistant Secretary of Education Diane Ravitch (2010: 211), fundamentally undemocratic: voters cannot un-elect foundations if they do not share their school reform interests; and while foundations demand that public schools and teachers be held accountable for performance, there are no like accountability demands for them. Another area where large foundations and especially Gates have drawn concerns is global public health. Gates' involvement and the relative magnitude of its resources impact international development priorities; exert undue influence over the WHO; favor neoliberal, market-oriented approaches; and push broader economic interests (Mitchell and Sparke 2016). Some observers generally predict that the combined philanthropic resources in the United States will come to equal the discretionary spending part of the federal budget over the following decades (Callahan 2017).

## Outlook and Conclusion

Despite these growing concerns, American foundations have not yet have had to face new regulatory pressures. To the contrary, the Obama Administration launched several efforts to develop active collaborative relationships with private funders. Most prominent among these was the Social Innovation Fund (SIF), which sought to identify and support innovative projects with measurable results in its funding areas. Participating funding intermediaries received, and had too match, federal grants up to $10 million, and held funding competitions to identify suitable nonprofits, which in turn had to raise additional matching support and agree to extensive evaluation requirements. A different approach to establishing collaborations between the federal government and private foundations was the Department of Education's Investing in Innovation (i3) program. I3 aimed at identifying, replicating, and scaling of innovations in schools. The Department of Education conducted a peer review process to generate a ranking of potential grantees, which however only became eligible for i3 support if they could raise a match of up to 15% from participating private foundations.

Both programs were subject to significant criticism focusing primarily on the perceived failure to identify and support truly innovative organizations and approaches. But the very nature of the collaboration also proved problematic in both cases albeit for different reasons. In the design of i3, foundations did not play any significant role. The contribution was effectively reduced to co-financing, and helping to scale up, innovations identified by the Department of Education, which effectively represented a complete reversal of the traditional division of labor between foundations and the government. The SIF design placed the funding intermediaries at the right spot, asking them to identify innovative projects, and scale them up with government resources, but program

demands and requirements were not adapted to allow foundations to maintain a degree of autonomy and flexibility (Toepler 2017).

Overall, these prominent and very large-scale attempts to redefine the traditionally difficult relations between government and foundations through active collaboration proved unsatisfactory in the USA. Whether the federal government will return to exploring truly collaborative partnerships in the near future seems at best uncertain. At the most, foundations might find themselves facing greater calls to step more into a substitutional role, as was the case during the brunt of the financial crisis (Abramson et al. 2014) and effectively in the design of i3. However, given the expanding interest of Western governments in philanthropy and the growth of resources flowing into foundations, more examples and new approaches to developing collaborative relationships with foundations will continue to be a significant area of study (Almog-Bar and Zychlinski 2012, 2014; Boyle 2017).

# Founder's Syndrome in Nonprofit Organizations

Stephen R. Block
Lone Tree, CO, USA

## Synonyms

Authoritarian leadership style; Bully leadership; Founderitis; Nonprofit board coup d'état; Nonprofit takeover; Organizational politics

## Syndrome

Almost all medical dictionaries share a common definition for the word "syndrome." The general meaning is a display of symptoms that help to define a certain condition or associated symptoms that are common enough to describe a disease.

## Founder's Syndrome

A real or perceived problem in the way a nonprofit organization founder manages and uses his or her positional power and control.

## Founder's Transformational Reaction Syndrome

This is the phase in which staff or board members move from admiration for the founder to feelings of disdain for the founder.

## Introduction

Almost all medical dictionaries share a common definition for the word "syndrome." The general meaning is a display of symptoms that help to define a certain condition or associated symptoms that are common enough to describe a disease.

For everyday usage by nonmedical professionals, the term syndrome may also share some similarities, especially for individuals focused on organizational behavior. The common features include organizational situations that are not isolated to one type of organization. Since the word syndrome has a pejorative intent, its application suggests conditions that are problematic to the organization's health and can negatively impact the culture of the organization. The systemic symptoms can include staff morale problems, higher levels of staff turnover, loss of funding, and unwelcomed media attention inimical to the interests of the organization. These symptoms are recognizable when a nonprofit organization has critical leadership issues with its organizational founder. Founder's syndrome is a real or perceived problem in the way a nonprofit organization founder manages and uses his or her positional power and control.

Until Block and Rosenberg's (2002) empirical study of "founder's syndrome," the term was shared by many as allegories of conflicts between organizational founders and either its staff or board of directors or both. The term can be applied to nonprofit and for-profit organizations. For the purposes of this article, the focus will be on nonprofit organizations. When addressing the issue of founder's syndrome, it is often thought to apply to one person. However, nonprofit organizations can also be created by a group of individuals that come together out of mutual concerns. They may constitute the founding board of directors and either a founding board chairperson or a group of founders can also manifest symptoms of founder's syndrome. While founder's syndrome occurs, it is not a condition that emerges in all organizations that are managed or governed by its founder.

Whether one or more individuals are involved in starting a nonprofit organization, such organizations are often created to solve a problem and improve or protect some condition that exists in local, national, or worldwide communities that have an impact on human beings, animals, or the environment (Carman and Nesbit 2013). Additionally, nonprofit organizations exist as a result of market or government failure and a vision of an individual or a group of individuals dedicated to accomplishing some specific end that could best

be achieved through an organizational entity to fill gaps not ordinarily available through the for-profit sector or government.

While many individuals have ideas about different ways to improve the human condition and the environment and protect endangered species, comparatively there are relatively few individuals in the world that are determined to follow their vision and create an organizational entity to address such concerns where profit is not the primary consideration. Those that do start nonprofit organizations are known as "founders." The commonality shared in the concept of founder's syndrome is that the founder is initially honored for his/her leadership and his/her vision and commitment to society. However, the acknowledgments and expressions of gratitude bestowed on the founder for his or her endeavors to address a societal issue through the start of a nonprofit organization are time limited. In other words, eventually efforts will be made to oust the founder by the board of directors, management staff, external funders, client groups, or some combination of the organization's stakeholders.

Some founder conduct should not come as a surprise or an immediate concern, because it is prompted by predictable human behavior. Individuals that become founders want to control the destiny of the organization they created. Given their emotional energy and often financial investment, founders start an organization with an aim to accomplish some specific mission, and they have a personal stake to accomplish their organizational goals and vision. A rhetorical question that can be posed is whether the public would think it improper for a founder of a for-profit company to use his or her position of leadership and privilege to influence the direction of board decisions and/or the work of the company's management and employees? There is enough cultural evidence in the world of "Silicon Valley" or other industries with technological advancement and entrepreneurship that demonstrate a deep admiration for the founders of companies that have amassed personal power and wealth (such as Bill Gates of Microsoft, Mark Zuckerberg of Facebook, Evan Williams of Twitter, Jeff Bezos of Amazon, Larry Page and Sergey Brin of Google, among others).

For some reason, there is a different societal expectation about founders of nonprofit organizations. Nonprofit organization founders in the USA are prohibited by the US Department of the Treasury's Internal Revenue Service from using their nonprofit as a means to aggrandize their financial worth. Although salaries are generally established through some market surveys and approved by a board of directors, the salary of a nonprofit founder is open to greater scrutiny, and they (not necessarily the board) are harshly disparaged should their salary appear excessive.

Additionally, founders of nonprofit organizations are expected to act differently, such as favoring decisions by consensus and structure flat organizations with minimal hierarchy. Perhaps the distinction and differences of expectation are consistent with the global expectation that nonprofit organizations should not be focusing on the "bottom line" of profits. Instead nonprofit organizational founders are judged by a strict focus on the mission of services for the greater public good. The general public adheres to a belief that staff earnings and a focus on mission-related services cannot be blended.

In studying board and executive director patterns of interaction for more than two decades, Block (2004) is unequivocal in his belief that a founder's vision or mission is not at the heart of concern. The problem is the founder's management style and use of his or her power and control. It may also be the case that the founder's behavior is not excessive. Nonetheless, individuals close to the organization may perceive founders as taking personal and inappropriate advantages when exercising their leadership roles and responsibilities (English and Peters 2011).

It is important to clarify the placement and type of power used in organizational relationships. One form of power that is based on organizational position does carry legitimate privileges to make decisions on the basis of having authority. Organizational authority, however, is not absolute and is subject to modification based on whether the power is defined through bylaws, an employment contract, or a result of the personality of

individuals in charge of the organization. A board of directors, for example, has the positional power and authority to force a change in the decisions promulgated by its executive director. Undoing the decisions made by a founding executive director is a complex process, and the challenge and hardship of social interactions that occur in the boardroom between the board and executive director often make the attempt to change a decision a futile attempt. In other words, sometimes a decision will stand rather than board members go through the tension and hostilities of challenging the founder. This is an important point because the symptoms associated with founder's syndrome may prevail because a board simply chooses to avoid a battle with the executive director. This same avoidance dynamic can occur with department and program directors in their reaction to a founder's decision.

Often, the concept of leadership is defined as having power to influence the behavior of others, especially followers. Nonetheless, a distinction should be made between leadership influence and behaviors that are based on organizational political performance, euphemistically referred to as Machiavellian. The term Machiavellian is based on the writings of an Italian historian and author in the sixteenth century. Niccolò Machiavelli authored The Prince in 1513 and characterized certain unprincipled political behavior as devious, deceitful, and abusive use of positional power. The power that comes from being a leader is a result of the followers' beliefs in the person. Followers generally feel respected and believe in the vision of their leader. Should followers withdraw their support, the leader would not have influence over them. In contrast, the use of Machiavellian power creates followership and compliance in response to feelings of fear and intimidation and not from followership based on a shared vision and respect for the leader. A famous sixteenth century quote from The Prince (Machiavelli 1532/1992) exemplifies the tone of unprincipled behavior sometimes attributed to founders with founder's syndrome: "it is much safer to be feared than loved because . . . love is preserved by the link of obligation which, owing to the baseness of men, is broken at every opportunity for their advantage; but fear preserves you by a dread of punishment which never fails" (p. 68).

Consequently, a founder's behaviors that are associated with the term founder's syndrome are often characterized as being heavy-handed, having questionable motives and dubious objectives. Also, founders with this associated syndrome are reported to have a lack of interest in consensus building or balancing and sharing power. Instead, founders tend to dominate and control the direction of the organization they started.

There are other founder characteristics or trends that were noted by Block and Rosenberg (2002). Contrary to best governing practices, nonprofit organizations that are managed or governed by its founder are less likely to have terms of service for its board members that were selected by the founder. The founder's objective would be to maintain his/her supporters as long as feasible. Power is also demonstrated through the focal point of board meetings, where the agenda is established by a founding executive director. The research findings revealed that the founder was more likely to review and edit the minutes of prior board meetings and thus control the historical and official records adopted by the board of directors. Study respondents also identified the founding executive director to be the most influential person during a board discussion and capable of swaying opinions. One of the more interesting and anomalous trends of nonprofit organizations that are managed by its founder is the impact on the organization's revenues. The organization's revenues will rise slowly compared to organizations managed by non-founders.

A common complaint among individuals who have direct contact with a person or group engaged in founder's syndrome is the oversight of people's work and work styles. Micromanagement is a form of (unnecessary) supervision in which a founder attends to the details of work methods and work products of staff members. While a founder may communicate their interest in helping, the recipient staff generally view the behavior as an extreme form of control and receive the communication as one in which the staff's knowledge and skills are being challenged.

Staff that are micromanaged often feel powerless to contradict the founder's style and advice.

The "victims" of micromanagement view their work life and how they are treated much differently than a founder's viewpoint. The founder's micromanagement behaviors are a function of two aspects of their human nature. They are overly involved because they want their creation to be successful. While staff may see the founder as spying on them and not trusting them, the founder is merely demonstrating a greater need to be aware of the organization's environment and the need to control what takes place in that environment. In other words, most observers of founder's syndrome do not factor in that the founder, like a parent, has more of a personal and emotional stake in the success of their creation. Similar to parental behavior, some founders have a harder time "letting go" and allowing their brainchild's direction to be influenced by others.

As the size of a nonprofit organization increases and its work becomes more complex, a founder may anticipate an increase in organizational issues that will require his/her increasing need for details to keep tabs on the organization's performance and effectiveness. The reaction of a board and staff to this dynamic has a long history with theoretical underpinnings. Frederick Taylor's (1911) classic scientific management model is premised on a "one best way" approach in which the work of staff is accomplished by the prescribed directives of managers at the top of the organization. In social psychologist Douglas McGregor's (1960) Theory X vs. Theory Y, Dr. McGregor distinguishes between two types of management styles that are aimed at motivating work performance. Theory X is similar in theme of Taylor's. In this model, managers are generally of the opinion that individuals do not want to work and need to be threatened of a loss of employment. Founders are cast into this Theory X because they, too, are viewed as an authoritarian rather than as a Theory Y participative style manager. These concepts also apply to founding board members who want to micromanage and direct the work of their executive director and other key staff.

## Reaction to Founders

How is it that in the beginning of creating an organization, stakeholders such as staff and board members want to honor a founder for their selfless qualities and later want to suppress the founder and remove him/her from the organization, including barring the individual from interacting with individuals they had working relationships for years, even decades?

The reaction of board members and/or staff in response to founder's syndrome is a related type of syndrome that has not been tested empirically; it remains a theoretical idea that is labeled "Founder's Transformational Reaction Syndrome" (Block 2016).

The first premise is that founder's syndrome cannot occur in isolation. A nonprofit organization with just the founder and no employees or volunteers cannot engage in founder's syndrome. For founder's syndrome to occur, there must be an application of social exchange theory and social systems theory. Social exchange theory concerns interactions between individuals that lead to some form of interdependent obligations (Cropanzano and Mitchell 2005). Social systems theory explains the effect of human interaction as having some form of cause and effect (Hendry and Seidl 2003).

In the field of psychology, there are well-defined defense mechanisms employed on conscious or unconscious levels as a way of protecting oneself from others who hold certain influence. One defense mechanism is known as reaction formation. The basis for reaction formation behaviors may have different roots, but the phenomena are consistent. Individuals will suppress their real feelings and opinions and adopt an opposite reaction. A person could tell an individual how much they like and respect them, but actually they dislike the individual and disapprove of them. A program director might, for example, inform the executive director that if she/he ever left the company, they would also resign. In reality, they have no intention of giving up their job and will not follow through on their statement.

Rationalization is a common defense mechanism whereby an individual convinces themselves that some unacceptable behavior or ill-thought is

justified. A board member who does not respect their executive director might tell other board members that the executive director seems to dominate board meeting discussions and therefore she/he is not the most effective or respectful executive director. Displacement is when an individual targets their thoughts and behaviors on to a person other than the individual of their true dislike. Consequently, a board member may engage in a dispute with another board member because it is safer than engaging in a dispute with the founder. There are several other psychological defense mechanisms all designed to protect oneself through masking intent.

The theory of Founder's Transformational Reaction Syndrome occurs when individuals begin to drop their defenses and over some course of time collectively begin to discuss their true feelings about a founder. This is the phase in which staff or board members move from admiration for the founder to feelings of disdain for the founder. In order to justify the change in behaviors and attitudes toward the founders, individuals first eliminate the defense mechanism that has masked their true feelings toward the founder. Giving up a defense mechanism is substituted by another defense mechanism in order to rationalize their change of opinion. When several key staff or key board members begin to reduce their reaction formation defensiveness, then they begin on a track of deliberative discussions about their concerns about the founder. Such meetings can be formal or informal but almost always take place without the knowledge of the founder. The more frequency of the meetings and the involvement of key individuals lead the participants to engage in disparaging remarks about the founder. Eventually, staff and/or board work in concert to plan strategies to liberate themselves from the founder's influence, control, and power.

The manner in which the issues raised by the non-founders with the founder will influence the type of behavioral response from the founder. Consequently, some reactions can be extreme (see Block 2004). In other situations, discussions about celebrating the work of the founder and announcing a retirement can lead to more positive outcomes for all parties and support a transitional change in leadership. If the board is attempting to push the founding executive director out of the organization, a threat of legal action or filing a lawsuit against the board of directors is the likely reaction by the founder.

Whether we agree with the characterization or not, there are in fact different value-based standards that society applies to nonprofit organizations and the people who are responsible for running them. Consequently, over time the independent behaviors of a founder are reevaluated from once having the spirit of a pioneer to becoming a megalomaniac that should be relieved of his/her duties as the founding executive director or founding board chair.

Indeed, every founder and organization has its own idiosyncratic characteristics, structures, and procedures for the level of involvement of the founder and other leadership. The degree of centrality and hierarchy varies significantly, too. Management of founder-led nonprofit organizations seems to be particularly demanding as a result of the defense mechanisms addressed earlier. Individuals may not be aware of their meta-messages when conversing with a founder. Communications at the content level may not match the meta-messages or nonverbal cues.

As well, board members and key staff may have ideological differences about direction and mission of the organization, impacting their discourse and sharing of strategic ideas. The symptoms of the nonprofit's dysfunction can be mischaracterized as board member or staff apathy and indecision. Since nonprofit organizations are the creation of people who bring in others to help share a common bond of interest, the source of success or failure resides with individuals in decision-making positions or hold positions of influence. In other words, organizational effectiveness, internal efficiencies, or dysfunctions are the by-products of human behavior within the nonprofit entity.

Since founder's syndrome is not evident in every founder-led organization, we can observe behavioral differences among nonprofit organizations. For example, we can point to problematic

communication styles and faulty decision-making models as fundamental elements contributing to unsatisfactory outcomes that contribute to founder's syndrome. Given the fact that most individuals engaged in organizational life have not been trained in decision-making, change management, or problem resolution, founder's syndrome is not predictable or omnipresent.

It is likely, however, that through keen observation, some manifestations of founder's syndrome can be identified in every organization in which the founder is involved. Evidence or symbols of founder's syndrome might appear during verbal exchanges that occur in the boardroom or between paid staff triggered by interdependence of position, status, unreachable goals, or obstructive stalemates. Some of the causes for founder dysfunctions are a result of having no immediate social repercussions. It is the individualism of the founder that bolsters problems or is accused of exacerbating issues, but the founder' contribution to the dysfunction may be a reaction to the unity of board and staff whose support changes through Founder's Transformational Reaction Syndrome, thus undermining what the founder believed was once a unified board and staff.

## Conclusion

Founders are risk takers with a high need to succeed after creating a nonprofit organization. In some situations, a founder's behavior is characterized as overbearing and even heavy-handed. On one hand, it is possible that the officious behavior is personality driven. On the other hand, the behavior may be the result of a founder who asserts and defends his or her ideology that prompted the founding of the nonprofit organization.

It may also be the case that being a visionary does not equate to being a knowledgeable and effective manager. When a board, staff, or funders begin to challenge the direction or decisions of the founder, some founders may feel threatened. Rather than explore the criticisms, a founder may become discouraged and try to defend his or her decisions. The receiver of the founder's communications may interpret the founder's defensive response as self-centered, unreasonable, and a display of unwillingness to tolerate a participative organizational environment.

More attention should be given to the interactional behaviors of the founder, staff, and board members to truly understand the root causes of founder's syndrome in nonprofit organizations.

# Fourteenth Amendment, Voting Rights, and Social Policy

Gloria J. Billingsley
Jackson State University, Jackson, MS, USA

## Synonyms

Due process clause; Social welfare policy; Suffrage; Voting rights; Welfare policy; Welfare state

## Definition

Due process is the right to a fair hearing before being deprived of life, liberty, or property.

The 14th Amendment is an amendment to the US Constitution which guarantees citizenship, due process, and equal protection under the law.

Voting rights is the right granted to citizens in a country or jurisdiction to have unobstructed access to and participate in electing political leaders.

Social policy is a broad set of policies designed to ensure that individuals have access to basic needs such as food, clothing, housing, employment and education, and opportunity for self-determination.

## Introduction

Adopted in July 1776, the Declaration of Independence was the first consensus statement on the belief in the intrinsic value and equality of all human beings. The words in the Declaration of Independence represent values that are espoused by democracies worldwide.

> We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights that among these are life, liberty and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed, – That whenever any form of government becomes destructive of these ends, it is the right of the people to alter or to abolish it, and to institute new government, laying its foundation on such principles and organizing its powers in such form, as to them shall seem most likely to affect their safety and happiness.

For years, the Declaration of Independence was an empty promise as a large portion of the population of the United States were held in servitude and bondage. Women and Blacks were denied these unalienable rights without the ability to hold government accountable for its actions. "A key characteristic of a democracy is the continued responsiveness of the government to the preferences of its citizens, considered as political equals" (Dahl 1971, p. 1). V. O. Key stated it best "Unless the masses views have some place in the shaping of policy, all the talk about democracy is nonsense" (Key 1961, 7). The ratification of the 14th Amendment to the US Constitution institutionalized the inalienable rights described in the Declaration of Independence.

## Fourteenth Amendment to the US Constitution

The 14th Amendment to the US Constitution was ratified on July 9, 1868. The Amendment contains four foundational principles on which many of our personal freedoms and rights are derived. First, the 14th Amendment validated the right to state and federal citizenship for any person born or naturalized in the United States including newly freed slaves. Second, it protects individual rights across state lines. Third, it prohibits states from arbitrarily taking an individual's life, liberty, or property without due process of law. Finally, it guarantees all persons equal protection under the law.

A major strength of the 14th Amendment is its explicit inclusion of states in the prohibitive behavior which has provided the legal premise to expand the civil liberties and rights to all Americans in such areas as civil rights, voting rights, gun-control policies, substance-control regulation, gay marriage, and property regulation. The US Supreme Court rulings in these areas over time have operationalized the specific rights inherent in

the guaranteed due process protection of life, liberty, and property (Calabresi and Vickery 2015).

The 14th Amendment, Bill of Rights, and the Declaration of Independence are products of John Locke's natural rights theory. According to Locke's theory, natural rights are supreme, are not subordinate to laws or customs, and cannot be taken away. It is in this context that the 14th Amendment is widely interpreted to grant civil and political rights to minorities (Calabresi and Vickery 2015).

## Voting Rights

In 1964, the 24th Amendment to the US Constitution made poll taxes illegal in federal elections. The 24th Amendment created additional legal foundations for the push for voting rights for African-Americans. The Voting Rights Act was signed into law on August 6, 1965 as a remedy to egregious discriminatory voting laws and practices impinging the rights of African-Americans guaranteed in the 15th Amendment to the US Constitution. There were two primary foci of the Act: (1) the prohibition of any test or device or disenfranchising measures that would obstruct access to the ballot and (2) to protect the strength of the minority vote by preventing states and local municipalities from employing devices or strategies that would prevent them from electing candidates of their choice. In 2015, we celebrated the 50th anniversary of the Voting Rights Act of 1965.

The Voting Rights Act contains both permanent and temporary provisions. Temporary provisions must be reviewed by US Supreme Court and reauthorized as a continued necessity. Temporary provisions in the Act are found in Sections 4 through 9, Section 13, and Section 203. Section 4 provides the formula to identify jurisdictions that must seek preclearance by the US Department of Justice for the passage of voting laws or changes to existing voting laws as required under Section 5 of the Voting Rights Act. Section 203 was added in 1975 and provides a formula to determine which jurisdictions must provide language assistance to English Second Language (ESL) minority voters.

A foundational piece of the Voting Rights Act is the Section 4 Coverage formula. The original coverage formula to determine which jurisdictions would fall under Section 5 preclearance monitoring by the US Department of Justice was based on whether the jurisdiction had utilized a test or device as an eligibility requirement or if less than 50% of the voting age population was registered to vote or voted in the 1964 presidential election. The Act was reauthorized in 1970 for 5 years, 1975 for 7 years, 1982 for 25 years, and 2006 for 25 years. The 1965 covered states were Alabama, Georgia, Louisiana, Mississippi, South Carolina, and Virginia, 40 counties in North Carolina, and 1 county in Arizona. In 1970, the coverage area expanded to several counties in California, New Hampshire, and New York. In the 1975 reauthorization, more states were covered under the language minority provisions of Section 203 which required jurisdictions where any one group of minorities represented five percent of the population and where all election material was provided in English to provide language assistance (National Commission on the Voting Rights Act 2006).

The 1982 reauthorization of the Voting Rights Acts provided a mechanism for states and local jurisdictions to be removed from the Section 5 preclearance requirements called "bail-out" by providing substantive evidence that it had refrained from engaging in discriminatory voting practices in the 10 years prior to the request. The specific criteria that must be met are (1) no literacy test or other device, (2) proper preclearance received before implementing voting law changes, (3) no objections from the Department of Justice for proposed voting law changes, (4) no rulings for plaintiffs in cases alleging voting discrimination, (5) no consent decrees or agreements because of voting discrimination, (6) no pending voting discrimination lawsuits, and (7) no federal observers called in to monitor elections at the state or local level (National Commission on the Voting Rights Act 2006). Research has shown that many of the 1965 covered jurisdictions are not able to meet the criteria to come from under preclearance coverage (Billingsley and Murray 2015).

There have been a number of lawsuits filed to challenge the legality and validity of the Voting Rights Act and its implication for state and local governments to govern within their jurisdictions. Several landmark voting rights cases may be instructive to our understanding of minority fight to maintain the right to vote after passage of the Voting Rights Act of 1965. *Allen v. State Board of Elections* (1969) the question under court review centered on what constituted a test or device when determining what laws or practices required preclearance by the Department of Justice. The US District Court ruled that it was not unconstitutional for a jurisdiction to require that write-in votes be in the voters own handwriting and did not require Department of Justice preclearance as it was not a "test or device" as defined by the Voting Rights Act (https://supreme.justia.com/cases/federal/us/393/544/case.html). However, the US Supreme Court expanded the coverage of Section 5 to include any mechanism or strategy designed to obstruct access or dilute minority voting power. This was important as many african-Americans were unable to read or write well. *Allen v. State Board of Elections* was a "landmark case that served as the impetus for a series of judicial victories that increased Black representation" (Orey et al. 2016a, 129–130). In *Thornburg v. Gingles* (1986), the US Supreme Court addressed a major weakness in previous ruling in *Mobile v. Bolden* (1980) which placed the burden on plaintiffs to prove legislative intent when vote dilution occurred by explicitly identifying the steps plaintiffs need to take to win vote dilution cases. Prior to the *Thornburg* ruling, only 21 Blacks had been elected to Congress but nearly doubled to 40 after the ruling (Orey et al. 2016a).

Unfortunately the gains that Blacks, other people of color, and language minorities have made continue to be threatened into the twenty-first century. Policies and practices and even rulings by the US Supreme Court appear to violate or move away from the spirit and legislative intent of the Voting Rights Act (Orey et al. 2016a).

The landmark decision in *Shelby v. Holder* (2013) eroded the fight of nearly 50 years for governmental protection of minority rights to vote and to elect officials of their choice. Shelby County, Alabama, sued the US Attorney General asking the Federal District Court to repeal Section 4(b) and 5 of the Voting Rights Act declaring these provisions unconstitutional. *Shelby* also sought a permanent injunction against their enforcement. The federal District Court ruled against the county and upheld Sections 4 and 5 of the Voting Rights Act. However, the US Supreme Court ruled Section 4 unconstitutional. While the Supreme Court did not rule on Section 5, striking down Section 4 released the covered jurisdiction from having to seek preclearance of voting laws and made Section 5 inoperable. Individuals and groups may still challenge discriminatory voting rights practices under Section 2 (Orey et al. 2016b). Tremendous disenfranchisement can occur using this reactive versus the proactive approach of addressing discriminatory practices.

Evidence of the impact of the *Shelby* ruling was felt immediately as a number of states, particularly Southern States most of which had previously required preclearance, began passing restrictive voter registration laws to include strict registration deadlines, limits on early voting, photo identification requirements, and racially motivated redistricting (McElwee 2015). According to the National Conference of State Legislatures, 34 states have laws requesting or requiring voters to show some form of identification at the polls http://www.ncsl.org/research/elections-and-campaigns/voter-id.aspx#Lawsineffect. Voter identification laws in several states are being challenged in federal court. Voter Identification laws go back to the 1950s. There has been mixed 2016 rulings issued in court cases in Ohio, Texas, North Carolina, and Wisconsin. The US Supreme Court ruled in favor of Ohio's law to prohibit persons from registering and casting early vote at the same time. Challenges to Texas, North Carolina, and Wisconsin voter identification laws were successful with the Courts requiring Texas to develop nondiscriminatory processes prior to the November 2016 election, overturning of North Carolina Law as it deliberately targeted African-Americans with express purpose of lowering African-American vote, and requiring Wisconsin to accept more forms of

identification for the 2016 election (New York Times, July 30, 2016).

Another area where significant disenfranchisement has occurred is in the criminal justice system. While many countries have opted to allow prisoners and parolees to vote, the United States still prohibits persons who are serving prison or jail time for felonies from voting. Even after convicted felons have served their prison terms, some states permanently prohibit them from voting. Since prison population is disproportionately people of color, these laws have a disparate impact and leave millions unable to participate in the cornerstone of democracy (McElwee 2015).

## Social Policy

Entitlements have become a part of the institutional fabric of modern society. Broadly conceptualized, many sectors of society receive entitlements or money from the government to meet public goals. While the focus of entitlements is negatively connected to the poor, wealthy individuals and businesses have and continue to receive entitlements in the form of government subsidies, long-term contracts for defense space and education, and social security pensions. There is widespread support for the above referenced entitlements. Entitlements are only viewed negatively when associated with the poor. Entitlement is based on the belief that society or government has a responsibility to ensure that individuals have the resources they need to meet their basic needs – not as charity but as a right. Social rights are "the whole range from a modicum of economic welfare and security to the right to share to the full in the social heritage and to live the life of a civilized being according to the standards prevailing in the society" (Orloff 1993, p 306).

The New Deal was one of the first major efforts in the US government's development of social policy to address widespread devastation as a result of the Great Depression. The provision of social security, unemployment compensation, public housing, and other forms of public aid were policy interventions aimed at ameliorating the effects of abject poverty (Reich 1965).

The term "welfare state" is the term commonly used to categorize the conglomerate of governmental programs and interventions designed to ensure that all citizens have a right to decent and healthy living conditions. The philosophy undergirding the welfare state is the notion of entitlement as a part of the triad of all human rights: civil, political, and social (Cox 1998). Others have further conceptualized the right to welfare benefits as contract between citizens and their government in which citizens are obligated to meet certain eligibility requirements and the government has certain enforcement powers (White 2000). "Originally intended to alleviate poverty, soften the sharper edges of capitalism and stand as the crowning achievement of postwar prosperity, the welfare state now suffers criticism for fostering dependency, social isolation and the breakdown of public morality"(Cox 1998).

Central to the argument that citizens have a right to public assistance are provisions necessary to protect those rights. The 14th Amendments due process protection and the contract between beneficiaries of the welfare state and the government have been uneven in terms of distribution of power. While the media, non-beneficiaries, and the government tend to focus on outlier cases of welfare abuses, missing in this discussion is the abuse beneficiaries are subjected to in exchange for the benefits provided under this social contract. The abuse resulting from differences in power run antithetical to the original intent of the Social Security Act which clearly provides provisions for due process rights to beneficiaries to ensure opportunity to acquire benefits and recourse when they believe they have been treated unfairly.

Almost since the institution of social welfare, there have been rumblings about perceived abuses and a need for reform. While welfare reform has been framed as a remedy to address fraud, waste, and abuse, it is ultimately about who is deserving of government assistance and if deserving, how much and under what conditions. In other words, welfare reform is about whether public sector or private sector solutions are appropriate to address a host of social ills such as poverty, education, health, and employment (Cox 1998).

A major piece of US federal welfare reform legislation is the Personal Responsibility and Work Opportunity Reconciliation **Act** of 1996 (P.L. 104–193) passed as an bipartisan effort under President Bill Clinton. The cornerstone of the legislation is its goal to align the program with its original intent for time-limited assistance by moving beneficiaries to permanent employment. However, its implementation is fraught with problems and is not the panacea many had hoped.

The Personal Responsibility and Work Opportunity Reconciliation Act and other prior benefit requirements have created provisions that raise concerns regarding their unconstitutionality in terms of possible violations of civil liberties of welfare beneficiaries. Although, the US Supreme Court in *Goldberg v. Kelly* (1970) ruled that welfare beneficiaries have a right to due process established by the 14 Amendment, many welfare recipients are denied without due process. Major areas of constitution rights violations cited in the literature are (1) denial benefits to parents who conceive additional children while receiving benefits. Some suggest that there is no difference between providing extra benefits to poor families and middle class who receive income support through tax deductions: (2) coercing poor women to give up their rights to procreate through the use of invasive long-term contraceptives in exchange for benefits eligibility (Albiston 1994) and (3) forcing teens to live with their parents to receive benefits.

## Globalization and Social Policy

Globalization originated as a private sector term used to describe how communication technology aided the management of production and transport systems technology across global borders. The meaning of globalization evolved to describe the "increasing interconnection of economic, social, ecological, technological, economic, political, and cultural systems throughout the world" (Yeates 2007). Social policy is often viewed in isolation without respect for its permeability across national boundaries. There is a global interconnectedness between what happens in the United States and policy interventions and outcomes in other countries. Conceptualizing social policy in a global context fosters dialogue, creativity, and innovation to address a multiplicity of complex health and social welfare issues of international salience.

## Social Policy and Political Representativeness

The security and stability of a democracy is predicated on the broad participation and continued support of the democratic principles espoused by the democracy. "In order for the democracy to remain secure and stable, each new generation of citizens must believe in the system and believe that it works for people like them and voting provides a barometer of the public's trust in the political process and in government" (Flanagan and Faison 2001, page 4). Minority and poor voters learn early on that they don't matter and as a result often don't believe in the power of their vote to effect change. Conservative policy interventions often confirm their belief about their place in society.

Several studies suggest that the political preferences and opinions of low-income voters are often not reflected in the voting behavior of their elected representatives (Bartels 2006; Ellis 2012) and that the policies passed are more reflective of the preferences of the more affluent (Gilens 2005). While eligibility for most social welfare benefits is means-tested, racialization of social policy issues overshadows good public policy even in programs where racial minorities are not the greatest consumer of services. Beneficiaries of social welfare policy are racially and ethnically stereotyped which leads to the introduction and support of policies align with the parties predisposed belief about who deserves to receive public assistance or affirmative action (Hussey and Pearson-Merkowitz 2013).

Voter turnout impacts policy outcomes, particularly in terms of social policy and welfare policies. A study on voter turnout rates found that when low-income voters had a strong presence at the polls similar to their upper class

counterparts, legislative bodies at the state level were less inclined to adopt strict welfare eligibility requirements (Avery and Peffley 2005). A decline in voter turnout by low-income voters has an adverse impact on their ability to voice their preferences on policy issues. Highton and Wolfinger (2001) conducted a study on nonvoters preferences and only found modest gains in public policy outcomes from higher voter turnout. A more recent study was conducted to understand economic bias in voting behavior of the 110th US House of Representatives supported earlier research findings that voters are more likely to have their policy preferences addressed than nonvoters and that the representatives of less affluent voters less likely to vote for issues that are in their best interest (Ellis 2012).

While voter turnout is important in elections at all levels of government, its impact is most acutely felt in local elections. Due to the low concentration of minority populations in many cities, increased voter turnout of Latino, Asian-American, or African-American may not result in parity in representation on city councils (Hajnal and Trounstine 2005). Elections are not only about racial, ethnic, and diversity representation but also about who gets to determine the allocation or reallocations of goods and services. High-stake redistributive outcomes often result in minority populations' inability to elect representatives even when they constitute the majority population (Hajnal and Trounstine 2005).

## Conclusion

Suffrage is defining characteristic of modern democracies. Lockean Natural Rights theory both highlight the importance of every citizen having inalienable rights which have been validated to case law. Women and people of color in the United States fought hard to gain the right to vote and are still fighting to retain this right. Voting is more than electing persons to office; it is determining the content of public policy and determining the allocation of resources, goods, and services and is a badge of citizenship. The 14th Amendment is one of the most significant amendments and evidence by its use to secure and clarify the right to life, liberty, and property. Political representation is important in terms of social policy and is the area where the impacts of policy outcomes are most acutely felt. Research has confirmed that too many voices are not being heard because they either voluntarily remain silent by not voting or modern-day voting policies take away their voice through stringent federal and state temporary or permanent disenfranchisement of convicted felons. Evidence suggests that mobilizing low-income voters should be the next area of focus in the voting rights battle since voting practices of elected officials has been found to be inextricably linked to those groups with high voter turnout. Also, low-income voters could vote their policy preferences by withholding their vote from candidates who don't vote in their best interest. Finally, attacks on the voting rights act particularly in terms of Shelby v. Holder and modern-day tests and devices such stringent voter ID Laws, and other strategies to compress voter turnout could set voting rights accomplishments back decades. (See Billingsley and Murray 2015).

# Framework Agreement

Rajesh K. Shakya
The World Bank, Washington, DC, USA

## Synonyms

Framework agreement; Framework contract

## Definition

A framework agreement is a general term for procurement agreements with supplier(s) that set out terms and conditions that allow public bodies to order goods or services throughout the term of the agreement for the repetitive purchases under the terms and conditions specified in that framework agreement (Shakya 2013).

## Introduction

Procurement entities need to procure goods, works, and/or services very frequently to achieve the organizational, project, or national development objectives. More often similar items are procured in repetitive manner following the traditional procurement methods and processes, which consequently involves more time and more bidding process costs. Framework agreement is one of the most popular procurement methods in the modern procurement practices for procuring such repetitive purchases. Framework agreement procedures are often used to procure the goods, works, and services for which a procuring entity has a need over a period of time or at a time in the future, but does not know the exact quantities, nature, or timing of its requirements. For an example, a project procures office supplies more than one time during the same fiscal year due to unpredictable consumption of those items. Every time a procuring entity has to go for the procurement process spending more time and money on the process. Example also includes

commodity-type goods purchases, such as stationery, spare parts of equipment, information and communication technology supplies and maintenance, road maintenance services, security services, cleaning services, where the market may be highly competitive and where there will normally be regular or repeat purchases for which quantities may vary. This is also suitable for the purchase of items whose need is expected to arise in the future on an urgent or emergency basis, such as medicines, emergency response services, etc. This type of agreement can also be considered as a suitable method, where surety of supply is highly required like in the case of specialized items requiring a dedicated production line.

Framework agreements can strengthen governance. They facilitate procurement planning because the time to acquisition is minimal, procurement processes are greatly simplified, and costs may be largely known in advance. Framework agreements also partly address weaknesses in capacity found in numerous jurisdictions (Schapper et al. 2011). Albano et al. (2010) recognized framework agreement as potentially effective and innovative purchasing arrangements, allowing public agencies – both at central and local level – to aggregate demand and streamline procurement processes, while keeping some degrees of contract flexibility.

Sound public procurement systems aim at achieving good governance and value for money. Cost control, avoiding abuse, and corruption are therefore a key aspect of any public procurement system as a whole. Indeed, governments are increasingly urged to cut public spending, and public spending on goods, works, and services is the target of cost-controlling government policies. This is very often done by rationalizing public expenditure on goods, works, and services, which account for a considerable proportion of GDP – the OECD estimates from 13–20% worldwide.

Recent developments in public sector procurement have raised questions about the extent to which requirements of procuring entities or within the large agency should be pooled and let fewer and larger contracts. The efficiency agenda is driving the efforts towards reducing procurement costs, making use of combined influence as buyers and achieving economies of scale. Albano (2013) recognized that demand aggregation is an effective way to streamline procurement process and reduce purchasing costs by exploiting the public buyer's higher bargaining power. By replacing several independently run processes, centralization helps standardize the "procurement language" – as competing firms interact with one rather than many public authorities – while leading to a progressive reduction of the variety of technical specifications set by purchasing bodies, thus reducing firms' participation costs. This is why, all over the world, governments have encouraged aggregated purchasing, and some have entrusted a governmental agency/body to implement centralized purchasing strategies. The Government Procurement Service in the UK, GSA in the US, PPS in South Korea, ChileCompra in Chile, Hansel in Finland, BBG in Austria, the recently created ESPAP in Portugal, and Consip in Italy are just some examples of this type of agency/body.

## Definitions and Variations of Use

Under international regulation and practice, several broad definitions of framework agreements can be identified, with some common and some different characteristics. In many countries the expressions "framework agreement" and "framework contract" are used almost interchangeably both at the regulatory and the practice level, although legal implication of "framework contract" is different than "framework agreement." The terminology has also referred to framework contracts, common use agreements/contracts, long-term agreements, standing offers, rate contracts, parallel rate contracts, dynamic purchasing, panel contracts, draw-down contracts, pooled procurement, IDIQ (Indefinite Delivery/Indefinite Quantity) contracts, Multiple Awards Schedule (MAS), multiuse lists, standing offer arrangements, transversal contracts, cooperative contracts, and so on.

A framework agreement is an arrangement for the anticipated supply of goods or services over a specified period of time. A framework agreement is used in the case of repetitive purchases where there is no guaranteed volume or value of business. The agreement sets out the terms applicable to the contracts formed at the call-off stage, i.e., when an order is placed. If all terms are fully specified then it is defined as a framework contract. Where a secondary process is required to finalize specifications and make a selection, then it is a framework agreement.

United Nations Commission on International Trade Law (UNCITRAL) defines framework agreements as a transaction to secure the supply of a product or service over a period of time (periodic/recurrent purchase arrangement, periodic requirements arrangement, and periodic supply vehicle; UNCITRAL 2008).

European Union defines framework agreement as an agreement between one or more contracting authorities and one or more economic operators, the purpose of which is to establish the terms governing contracts to be awarded during a given period, in particular with regard to price and, where appropriate, the quantities envisaged (European Union 2004).

## Classification of Framework Agreement and Contracts

A framework agreement is legally binding both parties and can be entered into:

- Between a leading agency (contracting authority) and one supplier
- Between a leading agency (contracting authority) and more than one supplier

A framework contract based on the framework agreement is legally binding the procuring entity and the suppliers and can be entered into:

- Between one or more procuring entity and one supplier
- Between one or more procuring entity and more than one supplier

## Advantages of Using the Framework Agreement

- Facilitate procurement planning:
  - Facilitates to aggregate demands
  - Meeting the needs of the procuring entities in a short time
  - Procurement processes are greatly simplified
  - Costs are largely known in advance
  - Partly address weakness in capacity of procurement
  - Frameworks facilitate enhance planning of program expenditures
- Lower contract prices and improved quality and reliability:
  - Consolidation of demand and returns to scale for manufacturing
  - Greater volumes and certainty for suppliers improves inventory planning
- Reduced costs of process and contract management:
  - Fast and flexible award of subsequent contracts
  - Minimizing administrative costs for the organization of a new procurement procedure
  - Many purchase orders from the one contract process
  - Just-in-time purchasing
  - Reduced costs of contract management
- Efficient emergency operations:
  - Immediate access to related goods and services
  - Automatic recognition of prior expenditure
  - Competitive prices
  - Guarantee of service
- Efficient use of scarce capacity:
  - One agency creates a framework agreement that other agencies purchase from that agreement without conducting a procurement process of their own and thereby significantly extending the effectiveness of existing procurement capacity.
- Enhanced governance:
  - The elements of consolidation of common procurement implicit with framework agreements allow for considerably stronger governance controls and oversight, and reductions of discretion.

– Standardization of process implicit within framework agreements strengthens the potential for technological applications with multiple benefits in terms of oversight, management information, and efficiency.

## Applicability of Framework Agreements

A framework agreement can be especially relevant when:

- There is frequent reordering based on the same (or similar) set of specifications.
- The volume required cannot be precisely predicted.
- The required delivery dates cannot be precisely predicted.
- Procuring entities across the government are acquiring the same supplies at different price rates.
- Aggregating the demand from procuring entities will lead to significant volume discounts.
- Small procuring entities lack the capacity to arrange and manage their contracts.
- Crisis planning (such as for natural disasters) cannot accommodate the time required for traditional processes.
- No single supplier is considered to have sufficient capacity.

Examples of contracts that can be assigned based on a framework agreement:

- **Supply**: Equipment, road signs, personal protective equipment and work, uniforms, school books, office supplies, IT supplies, computers, food, medicines, medical supplies
- **Services**: Maintenance, building maintenance specialist services, banking, air transport services, insurance services, mobile maintenance/maintenance of IT equipment
- **Work**: Black topping the streets, painting, plastering, excavation, building identical execution units (i.e., gas station, service center, garages, gyms)

Framework agreement can be used to cover all types of supplies services or works necessary for procuring entities.

The framework agreement cannot be misused or improperly used by the procuring entities in order to prevent, restrict, or distort competition. Thus, artificial grouping of items or services from different areas within a single framework agreement, which under normal conditions cannot be purchased together, can create confusion for suppliers of the procurement items and purpose of the framework agreement, with the effect of deprivation procuring entities to get the best deals.

## Stages of Framework Agreement Process

In broader sense, a framework agreement has two phases as illustrated in Fig. 1:

1. Establishment of the framework agreement, which usually follows open, restricted, RFP-based negotiations or other competitive procedures to establish the framework agreement with one or more suppliers.
2. Awarding specific contracts where procuring entities can place orders to the lowest evaluated supplier or carry out subsequent mini-competition if not all the terms were laid down precisely in the original agreement.

Lead agency is responsible for the Framework Agreement, but following the principle of transparency, the procuring entities (PEs) or procuring and disposal entities (PDEs) that are party to the agreement and consequently are allowed to make contract-orders must be listed in the notices, in the contract documents, and in the framework agreements. All suppliers that are part of the agreement must be listed in the agreement.

## Estimated Value

The estimated value of the framework agreement is the maximum estimated value of all subsequent

**Framework Agreement, Fig. 1** Stages of framework agreement

contracts expected to be awarded based on that framework agreement.

When the framework agreement is to be concluded by a lead agency (LA) or a contracting authority on behalf of a number of procuring entities, the estimated value is calculated taking into consideration all of the subsequent contracts, which are expected to be awarded based on that framework agreement by all entities covered by the framework agreement.

In estimating the value of the framework agreement, the lead agency and procuring entity will consider:

- Frequency of subsequent contract award
- Minimum and maximum quantities that could be subject to one of the subsequent contract to be awarded during the framework agreement
- Minimum and maximum quantities that may be required throughout the framework agreement

The procuring entities shall specify in the framework agreement notice and tender documentation with estimated information on minimum/maximum quantities of the framework agreement and subsequent contracts.

## Framework Agreement Procedure

### Requirements of the Invitation to Bid

The framework agreement (FA) notice shall contain all necessary information to allow bidders to decide whether or not to participate in the award procedures. This information shall include the name and address of the lead agency and responsible person/s for the procedure; the items to be procured, reference to the procurement procedure; the estimated budget and the duration of the agreement; short description of the procurement and/or lots if used; qualification requirements with regard to legal, economic-financial, and technical capacities; awarding criteria; terms of the framework agreement; the place, methods, and cost for

receiving bidding documents; the place, date, and time for submitting the tender and the place, date and time for submission and opening of the bids; the language/languages of offers and documents; any other additional information considered useful for the framework agreement as well as subsequent specific contracts by procuring entities. The framework agreement fixes the possible maximal prices for each item and the minimal technical specifications as well as the minimal delivery terms and warranty conditions. These facts allow suppliers to reduce the prices in order to make their proposal more attractive to buyers.

The lead agency (LA) prepares and publishes the public announcements.

The announcement of the winner from the framework agreement must contain: the procurement method reference, the correct name and address of the supplier/suppliers who are selected for the framework agreement; the description of the works/goods/services to be purchased; the duration of the framework agreement. Publishing the information of the awarded agreement will be as per the provision set out by the act and regulations.

## Award of Framework Agreement

To conclude a framework agreement, the lead agency can use the open, restricted, or RFP procedure. The supplier(s) to the framework agreement shall be chosen by the lead agency with reference to the bid, which meets the qualification criteria and is the responsive offer with the lowest evaluated value. All procuring entities and suppliers that are part of the agreement must be listed in the agreement.

*The procuring entities, which are not listed, are not allowed to use a framework agreement. In addition, it is not allowed to accept other Suppliers in the agreement after the completion of the procurement process*.

Offers should be assessed on technical and economic ground. Framework agreements are more efficiently managed if used e-Procurement Systems. In cases of e-Framework Agreement awarding procedures, the system should automatically manage the data, evaluations, and generate respective reports with the comments by different committees involved during the evaluation and notifying the bidders electronically. After comparing and evaluating bids, contracting authority identify the successful bid.

## Award of Contracts Under Framework Agreement

When awarding subsequent contracts, under framework agreements, procuring entities do not have to go through the full procedural steps again so long as the rules were followed appropriately in the setting up of the framework agreements themselves.

The length of subsequent contracts, under a framework agreement, can be of varied lengths. For example, subsequent contracts for consultancy services might be for 3, 6, or 12 months or longer. It may be the case, as a result, that subsequent contracts extend beyond the stipulated term of the framework itself. However, this should be done according to the act and regulations.

For example, it would be difficult to justify conclusion of 12-month subsequent contracts, right before the end of the life of the framework itself, where the normal pattern is to conclude similar contracts, for instance, for a month or so. The length of subsequent contracts, as with other contracts, should be appropriate to the purchases in question and should reflect value for money considerations.

## Framework Agreement Concluded with One Supplier

Where there is a single supplier, the users place orders as required at the terms agreed under the framework agreement. An example of this type of framework would be for the provision of office stationery. A framework agreement is concluded with a single supplier, and contracts based on that agreement should be awarded within the limits of the terms laid down in the framework agreement. For the award of these contracts, procuring

entities communicate in writing with the supplier, party to the framework agreement, with purchase order (PO) contract specifying the quantity, scope, and delivery details requesting it to submit its bid in accordance with the requests, and sign the contract for that particular supply.

It is the same principle as that applying to a normal contract, except that, with a framework agreement, there will be an interval between the awarding of the framework itself and the subsequent contracts of the goods, works, or services under it. There can be no substantive change to the specification or the terms and conditions agreed at the time that the framework is awarded.

Contracts based on framework agreements signed with only a supplier must be awarded within the limits and conditions provided in the framework agreement. No fundamental changes to the conditions can be made to contracts based on the framework agreement, as this would be considered a violation of the framework agreement. A supplier may be required to prepare their bid, concerning only those conditions that do not have a significant impact on the conditions initially agreed upon in the framework agreement.

If the needs of the procuring entities differ in a fundamental way, then the procuring entity must procure it through a new framework agreement arrangement.

## Framework Agreement Concluded with More than One Supplier

Framework agreements with several suppliers should be signed with at least three suppliers, if there are three suppliers meeting all the selection criteria and have an acceptable offer. If that is not the case, the lead agency may sign framework agreements with those suppliers that have met all the criteria, even if there are only two of them. Number of suppliers' selection depends on the volume of supplies, number of participating procuring entities, capacity of each of the selected suppliers to supply the desired volume, nature of item, total contract amount, duration of framework agreement, etc.

Usually, when the leading agency concludes a framework agreement with several lowest evaluated suppliers ranked as L1, L2, L3, L4, etc., their number cannot be less than 3, provided that there are a sufficient number of qualified suppliers. This rule applies regardless of the procedure chosen for the framework agreements.

Where frameworks, for the same goods, works, or services, are awarded to several providers, there are two possible options for awarding subsequent contracts under the framework.

### Option One: Cascading down the Ladder

Apply the terms of the framework agreement where the terms laid down in the framework agreements are sufficiently precise to cover the particular subsequent contract; the procuring entity awards the subsequent contracts without reopening any mini-competition.

Contracts based on framework agreements, in which all the conditions are set, which are signed with several suppliers must be awarded within the conditions stipulated in the framework agreement.

At first the contract request with purchase order (PO) is sent to the first lowest evaluated supplier (L1). If the L1 suppliers do not accept the purchase order, then procuring entity may send the purchase order to the second lowest evaluated supplier (L2), and so forth cascading down to the available number of suppliers in the framework agreement. Sometimes, it may result into nonprocurement, as the suppliers in the framework agreement cannot deliver the supplies as requested. In such cases a new framework agreement should be initiated or a mini-competition should be initiated based on the reasons of the failure to procure. If the needs of the procuring entity differ substantially, then the lead agency should consider starting of a new framework agreement.

**Example**: For example, frameworks might be concluded with five providers for the delivery of individual photocopiers, fax machines, and printers, separately priced, and for delivery within set timescales. If the procuring entity simply wants to call-off some photocopiers, it would go to the provider offering the most economically advantageous offer, using the original award

criteria, for that item alone without reopening the mini-competition. If that provider for any reason could not supply the items required at that time, the procuring entity would go to the provider offering the next most economically advantageous offer, and so on.

### Option Two: Hold a Mini-Competition

Where not all the terms are laid down in the framework agreement, price rates among the suppliers in panel varies much, or market price is fluctuated significantly, when the suppliers are again in competition on the basis of the same and, if necessary, more precisely formulated terms, and, where appropriate, other terms referred to in the specifications of the framework agreement.

An example of this type of framework would be works consultants with a mini-competition held to appoint, for example, an architect for a particular project. It is important that selection and award criteria are not confused and used at the wrong stage of the bidding process. A procuring entity cannot take account of a bidder's experience, labor, equipment, or ability to perform the contract by an anticipated deadline (which are selection criteria relating to capability) as part of the award criteria. Such criteria should only be taken into account at the framework agreement evaluation stage.

## Mini-Competition

Mini-competitions at the second stage (call-off in case of multiple suppliers under the framework agreement) of framework agreement can be conducted either using e-quotation method or e-reverse auction. Mini-competition is held in accordance with the following procedure:

1. For every contract to be awarded, procuring entity shall consult in writing the suppliers capable of performing the contract.
2. In the invitation sent to the suppliers, the procuring entity must define the criteria for determining the winning bid for the contract based on the framework agreement. The criteria for determining the winning bid can be the same as those of the framework agreement.
3. Procuring entities shall fix a time limit which is sufficiently long to allow bids for each specific contract to be submitted, taking into account factors such as the complexity of the subject-matter of the contract and the time needed to send in the bids.
4. Bids shall be submitted electronically through e-Framework Agreement System or e-Procurement System, and their content shall remain confidential until the stipulated time limit for reply has expired.
5. Procuring entities shall award each contract to the supplier who has submitted the best bid on the basis of the award criteria set out in the specifications of the framework agreement.

The framework agreements in which not all the conditions are defined are not considered contracts under the law on public procurement. Rather, contracts based on framework agreement are procurement contracts against which bills are paid.

In addition, the contracting authority could use other criteria, only if those criteria are defined in the documents of the initial framework agreement. Those criteria can include the prices for specific volumes, information on consultancy services for intellectual services, the necessary time required for delivery or the necessary hours spent in performing specific work.

Mini-competition may include the following terms for bidding and contracting:

- Specific delivery schedule
- Defined invoicing arrangements and payment profiles
- Additional security/guarantee needs
- Specific incidental charges
- Defined associated services, e.g., installation, maintenance, and training
- Clear definition of quality and rates
- Price mechanism
- Individual special terms (e.g., specific to the particular products/services that will be provided to meet a particular requirement under the framework)

## Contract Award

The maximum period for a framework will not normally be longer than 4 years. However, call-off contracts arising from the use of the framework may extend beyond this period. It should be noted that there should be reasonableness in respect of such contracts, i.e., a significant contract should not normally be awarded just before a framework is to be renewed. On completion of the bidding process to set up the framework agreement:

(i) All remaining bidders must be advised of the proposed award decision and the mandatory standstill period observed as per act and regulations.
(ii) A contract award notice must be published within for public notice; however, individual notices are not required each time the framework agreement is used.
(iii) Any request from a supplier to be debriefed must be completed as provisioned in the act and regulations.

## e-Framework Agreement

Potential savings from the implementation of e-Government Procurement (e-GP) have been estimated to be in the range of 5–8% of the procurement value (OECD-DAC 2003). When combined with the greater procurement coordination and management information and control that is facilitated by e-procurement costs have been reported to range between 5% and 20%.

The increase in competition from e-GP may yield substantial savings, through providing greater visibility and ease of access to the government market. If right combination of procurement methods is applied using e-GP, it can yield not only the benefit of savings but also significantly in efficiency, optimized use of public resources, and standardization in procurement across the government agencies. Framework agreement conducted and managed electronically adds significant contribution to that aspect of strategic procurements for the government and its taxpayer citizens. e-Framework Agreement contributes to the substantial cost savings, efficiency gain, and standardizing price and processes across the government starting with the procurement of common goods.

## Conclusion

Framework agreements-based procurement is not different than a common open competitive bidding procedure of procuring goods, works, and services except the process of contract awards. A framework agreement is signed by the lead procuring entity with one or a panel of suppliers as an outcome of the competitive bidding process and procuring entities issue call-offs to these suppliers, sometimes through a mini-competition (quotation method) among the suppliers for buying goods and services under the agreement. A separate purchase order of contracts is signed for each of such procurements by individual procuring entities to comply with their financial administration procedures.

Framework agreements streamline the contracting process – they are important mechanisms for raising the performance of procurement and can benefit both buyers and suppliers. These mechanisms are one response to the need for greater management performance. These instruments are used through aggregation or consolidation of demands from procuring entities or from within a large organization. The main aim of the framework agreement is to provide a mechanism for the tasks to be called off and carried out and also to provide a supplemental and complementary framework of provisions designed to encourage the parties to work with each other and with all other stake holders in an open, cooperative, and collaborative manner and in a spirit of mutual trust and respect with a view to achieving the framework objectives.

The most challenging aspect of framework agreement is managing and maintaining the records of multiple agreements and numerous contracts by different procuring entities under a single framework agreement. Only the electronic processing and management of the framework agreements and the contracts may help achieve the real benefit of expected efficiency gain through framework agreements. e-FA facilitates

keeping record all the framework agreements, contracts under such agreements, consumption records out of the agreements, and tracking the procuring entities delivery, payment, requirements, and procurements.

## Synonyms

New Public Management reform; NPM adoption and implementation

## Definition

Since the 1980s, the increasingly intense interest in public management reform, often referred to as "New Public Management," has become a global phenomenon. NPM is one of the several administrative trends seen in government organizations around the world over the last two decades, and its widespread popularity has been noted by many scholars and practitioners.

## Introduction

Since the 1980s, governments in many countries have undertaken various forms of public management reform, with New Public Management (NPM) among the most common of these reforms. At the same time, many have raised concerns about the negative effects of these reforms and some European countries have even discontinued its use. Given the level of disagreement about NPM reform, it is important to understand what factors influence the success or failure of these initiatives. This entry presents a framework for understanding NPM adoption and implementation by focusing on three key factors that influence these processes: initial conditions, environmental pressures, and reform dynamics.

Not surprisingly, researchers and practitioners have emphasized different components of NPM. For example, Dunleavy et al. (2006) identify disaggregation, competition, and incentivization as the main themes of NPM, while Pollitt (1993) indicates that NPM is characterized by the use of market-like mechanisms, decentralization, improvement of service quality, and customer satisfaction. Although no consensus definition of NPM exists, there is general agreement that NPM involves the application of a combination of market-based strategies and tactics to public agencies in order to enhance democratic values, bureaucratic representation, and balanced arrangements for competing preferences and organizational efficiency.

Knowledge about NPM reform derives from research that varies considerably with regard to descriptions of reform emphases, approach, and scope, as well as with regard to the types of

countries in which NPM strategies are applied (i.e., advanced, transitional, and developing countries), government levels where such reforms are undertaken (i.e., local, state, and federal level), main reform agendas (e.g., promoting efficiency, increasing citizen empowerment), and reform areas (e.g., financial reform, privatization, decentralization). Given the variation in research scope and context, issues regarding the universality of public administration arise. That is, do similar actions by public administrators in different contexts bring about similar results? If not, to what extent do culture and structural differences limit governments' abilities to assume that reforms that worked in one setting will work in another?

## A Conceptual Framework of NPM Reform

This section presents a conceptual framework for understanding NPM reform and examines several key issues associated with NPM adoption and implementation. The framework, shown in Fig. 1, comprises three stages: NPM adoption (governments' decisions to introduce NPM reform strategies), NPM implementation (activities that occur across the boundaries of government agencies and levels of government in order to carry out the proposed reform), and outcomes of NPM implementation (institutionalized programs that result from actions taken during implementation).

### Initial Conditions

Initial conditions – national context and structural context – influence both NPM adoption and implementation. While these are preexisting conditions that remain relatively constant, they are associated with other factors that are arguably contingent and dynamic (dynamic factors will be discussed below in the section on "Reform Dynamics").

#### National Context

Within the national context, two variables – political commitment and cultural considerations – influence NPM adoption and implementation.

***Political commitment***. *Political commitment* influences NPM reform in several different ways. More specifically, in some circumstances, e.g., where there is poor performance, inefficiency, and/or corruption in the public sector, politicians may pressure governments to introduce NPM strategies in order to gain popularity from the public by arguing that there is a need to move away from traditional public management approaches. Alternatively, because reforms often result in cutbacks in service provision, some politicians will find them to be politically unattractive, and so are less likely to support such initiatives.

Within government organizations, high-level officials hold a unique position between the policy process and political institutions, allowing them to play a key role in mediating between

**Framework for Understanding NPM Reform Initiatives, Fig. 1** Framework for NPM adoption and implementation

international and domestic stakeholders of reform. As a result, support for administrative reforms is generally more common among administrative leaders than among political leaders. Arguably, a strong coalition of support from both political and bureaucratic leaders is necessary for effective NPM reform.

Political commitment can also have a strong influence on NPM implementation. Based on studies of elites' resistance to reform in Uganda and Mozambique, Therkildsen (2006) argues that although reforms have been pushed most decisively by political-administrative elites, resistance to reforms can emerge if the elites' past decisions and present privileges are challenged by reform initiatives and implementation. Similarly, Larbi and Bangura (2006) argue that because reform implementation redefines power relationships between the state and society, between politicians and bureaucrats, between service providers and users, and among different government organizations, sustained political support for these reforms can be challenging.

***Cultural considerations***. Different countries have *different cultural and historical traditions*, and cultural differences across countries provide a key explanation for the variation in the success of NPM implementation. Arguably, the greater the consistency between the NPM-based values and the existing administrative system-based values, the more likely the NPM reforms are to be successful. While NPM reforms may change an organization's administrative culture, existing administrative cultural traditions may constrain reform initiatives and implementation. For example, a study conducted in Norway (Lægreid 2001) highlights the fact that administrative and political cultures can impede NPM reform.

### Structural Context

Constitutional/structural features and the formal structure of decision making within the political-administrative system can also affect a country's capacity to realize NPM reforms. Structural context includes two variables: legal capacity and fragmentation.

***Legal capacity***. Public agencies' *legal capacity* can greatly influence the NPM implementation process. A government's capacity to uphold its authority, legislate, and implement laws is clearly necessary in the implementation of NPM, and a well-developed judicial system is essential to providing the rule of law before the operations of markets can be undertaken. Alternatively, when a government's legal authority is weak, its ability to carry out new reforms will be constrained.

***Fragmented structures***. In *fragmented policy-making systems*, few ministers and secretaries are actively engaged in high-level policy dialogue regarding reform initiatives, and a lack of regular formal or informal mechanisms to facilitate discussions of strategic policy issues across government agencies limits the potential for successful NPM implementation. In addition, fragmentation limits opportunities for cooperation among different local governments in the provision of services. Lægreid (2001) found that that fragmented, complex systems tend to generate administrative policies with complex goals and processes, where reform measures are likely to be influenced by larger political aims and accommodation to donor pressures and/or individual ministries' strategies.

## Environmental Pressures

Environmental pressures can emerge from both external and internal contexts and generate both threats and opportunities. Different environmental conditions also interact and affect both decisions to adopt NPM and NPM implementation.

### External Context

The external context includes two variables: globalization and international stakeholders. Government organizations are likely to initiate NPM reforms as a response to these pressures.

***Globalization***. *Globalization* has made it easier for governments to search for alternative forms of organization, administration, and financing. It has also changed the nature and character of public administration and management from the traditional welfare administrative state to a more corporate administrative state, which often includes NPM-type reforms (Farazmand 1999). In such an environment, governments may feel compelled to initiate reforms to increase

international competitiveness. Interestingly, while some researchers argue that globalization is particularly responsible for catalyzing the demand for structural and institutional public sector reforms in developing and transitional countries (e.g., Chittoo et al. 2009), others (e.g., Lægreid 2001) argue that if reforms are introduced in countries that are heavily influenced by national traditions, an historical institutional context, and institution-specific traditions, the degree to which ongoing global trends actually result in administrative reforms will be limited.

***International stakeholders***. There is much evidence that *international (donor) stakeholders* (e.g., the World Bank, the IMF) both strongly influence many governments' decisions to initiate reform efforts, and substantially and directly affect these efforts (Chittoo et al. 2009; Therkildsen 2006). While globalization forces have stimulated the adoption of new reforms, NPM initiatives in developing countries can be particularly influenced by the degree to which international stakeholders encourage or require such reform programs. Especially in countries receiving a high level of aid, multilateral and bilateral donors have become major stakeholders in governmental reforms, demanding these reforms as a basis for continued support and, in some cases, linking negotiated structural adjustment programs to reform initiatives. When reforms are conditioned on donor funding, developing and transitional countries may accept reforms primarily so that they can receive this funding, which generates greater complexity in reform implementation and sometimes hinders reform processes.

### Internal Context

In addition to external pressures, several internal conditions create pressures for governments to adopt NPM reforms. Internal pressures arise from economic conditions, interest groups, and public opinion.

***National economic conditions***. *National economic conditions* have been identified as a key factor influencing the impact of NPM reform efforts across countries. In particular, worsening economic conditions increase the possibility that governments will review their management and administrative procedures; countries experiencing fiscal crises are more likely to see the need for cost-effective public service, reduced staff, and more professional management. Moreover, in developing countries where budgets are donor-dependent and, hence, unpredictable, NPM implementation can face additional challenges.

***Special interest groups***. *Special interest groups* can create pressures for or against reforms. Lobbyists in the private sector and other interest groups can create pressures for or against reforms, thereby increasing or decreasing the odds that NPM will be implemented effectively. In particular, several studies have found that public employee unions tend to oppose NPM reforms because they contain market-based approaches such as contracting out, which may result in fewer jobs and lower wages for their members as well as diminish their influence (e.g., Riccucci and Thompson 2008). Because union involvement can weaken the impact of NPM reform, governments should work to obtain union support in advance of NPM adoption.

***Public opinion***. NPM reform can also be driven by *public opinion*, which can be heavily influenced by the media. Studies have shown that if the media presents consistent support for or against reform programs, the public may create pressures based on these media messages (Therkildsen 2006). From a normative perspective, such democratic processes can be seen as drivers of reform. Alternatively, some argue that democratic values are generally not a central issue in reform adoption; rather, internal efficiency is the primary focus (Lægreid 2001).

## Reform Dynamics

Once NPM reform has been introduced, it is important to consider how *reform dynamics*, which serve a mediating role between the initial and environmental conditions and NPM implementation, influence the ultimate outcome of reform initiatives. Components of reform dynamics – organizational and managerial factors and interactions – are likely to interact over time.

### Organizational Context

The organizational context includes four variables – budgetary and human resources, expertise,

administrative capacity, and autonomy – that can influence the effectiveness of NPM reform processes.

***Budgetary and human resources***. *Budgetary and human resources* play a key role in NPM implementation because, to undertake such reforms, governments' financial and human resources need to be both stable and sufficient. Government agencies lacking budgetary flexibility or financial resources necessary for reform will likely face challenges performing the day-to-day requirements of NPM. For example, financial shortages can lead to a greater workload being undertaken by fewer staff, which decreases employee motivation and morale. Arguably, low pay and the inability to attract and retain skilled staff can be major obstacles to successful implementation.

***Expertise***. In addition to having enough staff, governments need staff with specific reform-related *expertise*. Although a lack of qualified staff can clearly limit the administrative capacity of governments to fulfill its tasks, governments can address this issue by developing expertise among existing staff.

***Administrative Capacity***. *Administrative capacity* – a government's ability to undertake basic administrative operations and provide basic human services – is also important to the implementation of government reforms. Weak administrative capacity to deal with domestic and international problems is particularly serious in developing and transitional countries where international donor institutions are generally the main advocates for reforms. In addition, governments need to guard against the tendency to rush to implementation without adequate preparation.

***Autonomy***. The amount of *autonomy* – both managerial autonomy and financial and legal autonomy – that ministries give lower-level governments to manage reform activities and resources can play an important role in NPM implementation. Along these lines, Batley and Larbi (2006) argue that managerial control over policy implementation and financial and human resources increases efficiency and allows for strategic approaches that are free from political intervention and emphasize that managerial autonomy is more likely to be granted when there are formal rules of accountability. In some cases, however, local officials who were used to functioning in a hierarchical relationship with a central ministry have had difficulties adapting to greater managerial autonomy.

### Managerial Processes

Managerial processes appear to have the most direct influence on implementation, while other factors seem to influence reform implementation through managerial processes. In addition, the organizational context and managerial processes often interact. For example, the utilization of organization resources may depend on particular managerial processes; likewise, managerial processes may be most effective when sufficient internal resources are provided. Three different managerial processes influence NPM implementation: leadership, goal clarity, and coordination.

***Leadership***. Strong *leadership* is often identified as the pivotal factor for successful implementation of NPM. For example, Samaratunge et al. (2008) argue that political leadership and commitment by ministers and public servants with primary responsibility for managing new reforms are the most significant factors influencing successful reforms, and Chittoo et al. (2009) note that reforms may suffer if the leader is transferred or retires. In addition, many emphasize the need to develop systems that are free of corruption.

***Goal clarity***. Having c*lear goals and strategies* can also greatly influence how effectively NPM reform implementation proceeds. Goals and strategies, however, cannot exist as mere rhetoric, i.e., statements of intentions; rather, they must serve as guidelines for action in both the political and organizational realm. When politicians incorporate clear goals, long-term development plans, and broad policy goals into their agenda, organizational innovations associated with NPM are more likely to succeed.

***Coordination***. Effective *communication and coordination* have also been found to be critical for successful NPM implementation. Since NPM reforms generally involve a complex set of actors (stakeholders), good communication regarding the objectives and strategies is vital for successful

implementation. Coordination of tasks among the different actors is also important, and poor coordination between policy-making and implementing bodies and between different levels of government can threaten NPM implementation. To enhance coordination during NPM implementation, continuous monitoring and feedback processes should be used.

### Interaction Processes

Interactions among actors can lead to various types of conflicts during both NPM adoption and NPM implementation.

***Conflict interactions among actors***. Not surprisingly, *conflict interactions* among actors within the public sector and across sectors can constrain governments' abilities to carry out new reforms. For example, power struggles between organizations (e.g., government agencies, private sector organizations, and union representatives), particularly those associated with disagreements related to resource allocations, can lead to resistance to reform. Additionally, resistance might emerge from fear that reforms will change power relations within or across different ministries. Conflicts have also been found to result from undefined and ambiguous roles of actors as well as a lack of clear guidelines from the ministries. Conflict and compromises driven from interactions among branches of government, however, can increase pressures for administrative responsiveness and accountability.

## Conclusion

NPM is arguably the most prevalent public management reform worldwide. Understanding the key factors that influence its adoption and implementation is important for both political and managerial leaders in the public sector. Three lessons regarding NPM adoption and implementation emerge from the framework presented here. First, the external context, particularly *international organizational stakeholders associated with reforms in* most developing and transitional countries, is critically important to successful NPM implementation. The high level of dependence these countries have on global institutions and foreign aid tends to decrease their leaders' decision-making discretion related to reform adoption or agendas, and the less control leaders have over key factors that influence the likelihood of success, the more likely such initiatives will fail. Second, there is still much to understand about NPM and related reforms, particularly how the changing environment of the public sector – including new organizational and governance structures – influences the success of NPM adoption and implementation. Finally, it is important to understand how NPM and related reforms can create changes in the nature and role of public administration and management. For example, Farazmand (1999) notes that an adverse consequence of both globalization and privatization has been the shrinkage of the public sector, which has diminished the capacity of governments to manage effectively. Along this line, while market-oriented reforms such as NPM have involved the integration of a diversity of organizational structures and management tools that have long been identified with the private sector into the public sector, there should not be a reduction in the focus of public administrators/managers on serving the public interest. Public managers must keep in mind distinctive public administration values such as maintaining the public trust and the importance of behaving as ethical leaders when considering the process of adoption and implementation of public sector reform.

## Synonyms

Digital governance; Digital government; eGovernance; e-management; Future government; ICT-based government; Innovative government; Mobile government; Open government; Smart city government; Smart governance

## Introduction

To understand the evolving relationship between eGovernment, smart government, innovation, and public service quality, it may be imperative to observe the changes that are taking place in the contemporary global society. The unrestrained demographic shift (occasionally intensifying from prolonged civil war and bad governance in some regions of the world), movement of human and financial capital, evolving relationships between states and citizens, and above all information and knowledge spread through technological advancement are pressing for change in governance throughout the world. In this context, the link between government, governance, citizens, and space has become more complicated than ever before. However, this apparently unsettled scenario is perceived by some scholars like Jiménez et al. (2015) as a new "ecosystem" that merits a new approach. Their view is centered on city-based governance to maximize benefits and minimize disadvantages. They maintain that public governance should be characterized by an open and smart government, and it should make the most of information and communications technology (ICT) as one of the powerful tools. The authors however caution that the implementation of this "intelligent" public management is a complex task that requires a multidisciplinary approach (Jiménez et al. 2015). Incited by this resounding view, this article begins with a search

for a theoretical construct on smart government, and therefore it is considered fruitful to take the discussion further to conceptualize the connection between eGovernment, smart government, innovation, and public service quality.

The United Arab Emirates (UAE) government has gone through various administrative reforms since the Union was established in 1971. In these reform efforts, the role of state leadership has been central in inculcating a culture of service improvement and efficient policy implementation through multiple tools. Lately, the vision of the state leadership to achieve people's happiness has been a critical factor in reconfiguring one of these tools – eGovernment. In the beginning of 2013, the UAE government came up with an innovative idea of smart government (also known as mobile Government or mGovernment), which is seen as an amended vision to outstrip its eGovernment strategy to reach the stage of smart government by as early as 2015.

This article is basically exploratory in nature. The specific objectives of this article are:

(a) To make a theoretical review of existing literature on public service quality, public service innovation, and smart government to propose a framework for discussion
(b) To analyze the contextual factors impinging on the adoption of the smart government model
(c) To describe the elements of the model in the UAE
(d) To assess the status of implementation in the UAE
(e) To evaluate the problems and prospects of the smart initiative

In spite of tremendous achievements, there have been two major concerns at the policy level: (i) a number of public organizations have failed to pull alongside other champion entities and (ii) a somewhat low usability by the government clients including citizens and businesses. These two issues need to be addressed to ensure that the smart government policy agenda of the UAE makes steady progress in the coming years.

Data and information for this article were collected from secondary sources. However, interview with three key senior officials in the smart government team of the UAE's Telecommunications Regulatory Authority (TRA) was conducted to explore the organizational learning from the smart government transformation process.

## Conceptualizing the Nexus Between eGovernment, Smart Government, Innovation, and Quality

### eGovernment

At the beginning of the new millennium, a group of new public management (NPM) skeptics such as Dunleavy categorically argued that the reform spirit of NPM gradually waned in many countries, and as a form of governance, it has become more complex in terms of managing institutions and policies. Based on their extensive research in seven "leading-edge" countries, Dunleavy and his colleagues observed that as a paradigm shift from new public management, digital-era governance has made citizen-state relationship closer through openness, engagement, and service integration (Dunleavy et al. 2005). Unquestionably, ICT-led governance (or eGovernment per se) now is one of the most important strategies in the public sector, for it serves as a tool for data analysis, for better decision-making, as well as for enhancing accountability and transparency. Moreover, such systems facilitate multilevel interaction involving citizens, government, businesses, and at different tiers of government at municipal, state, and federal levels. In the literature, these computerized systems are usually referred to as eGovernment, or eGov for short (Almarabeh and AbuAli 2010, cited in Alencar et al. 2015). In a narrow sense, eGovernment can be defined as the use of information and communications technology, especially the Internet and the web technology in running government activities in relation with government stakeholders (Rahman et al. 2012).

The use of ICT in government is not new. Many eGovernment initiatives are basically the continuation of computerization projects in

**From E-Governance to Smart Governance: Policy Lessons for the UAE, Fig. 1** Primary drivers of eGovernment

government agencies in the 1980s and 1990s. For example, from 1980s until mid-1990s, the government of South Korea (ranked first in United Nations E-Government Survey 2014) utilized computers to store government and related information in digital format. Various administrative databases and infrastructure were constructed to provide basic government service to public and private sectors. The basic information technology to support computerization projects is powerful hardware such as mainframe computers, centralized database management systems, and computer networks. Some governments (such as Singapore and South Korea) even instituted campaigns to gain greater use of the Internet and eGovernment services by its citizens. With the development of the Internet and the web technology, innovations in business and government have started to flourish in a high speed (Rahman et al. 2012; Almunawar et al. 2011).

From a government perspective, Al-Khouri contends eGovernment as an unquestionable strategic task to deal with facilitating the operation of government and the distribution of governmental information and services with an ultimate goal of increased portfolio of public services to citizens in an efficient and cost-effective manner (Al-Khouri 2014). Based on Atkinson and Castro's perception on eGovernment's contribution to building efficiency, improving services, providing better accessibility to citizens, and enhancing transparency and accountability (Atkinson and Castro 2008), the benefits of eGovernment are comprehensively abstracted by Al-Khouri in Fig. 1.

## Smart Government

Of late, smart government and smart city have received enormous attention in public management literature and forums worldwide. The concept "smart" has generated development discourse among the academics and policymakers alike. Smart government is defined in various ways. Gartner, Inc. defines smart government as a government which "integrates information, communication and operational technologies to planning, management and operations across multiple domains, process areas and jurisdictions to generate sustainable public value" (Gartner, Inc 2014). The definition of smart government by the World Bank is captured by an acronym SMART – a government with "Social, Mobile, Analytics, Rational-Openness and Trust" characteristics (World Bank 2014). It is also known as "intelligent government" (Mellouli et al. 2014). Looking through the lens of an eGovernment stage model, the abovementioned SMART characteristics seem to be fallen on the fifth stage of eGovernment. In that sense, smart government may be conceived as a highest stage of eGovernment where

government is expected to be connected with its clients and stakeholders.

A typical stage model may be a Web Presence Measurement Model used by the United Nations (United Nations 2003, cited in Almunawar 2011), which has the following five stages. The model proposes a linear and stepwise development of eGovernment starting from a limited web presence to full integration, seamless, and transformation:

- Stage 1 (Emerging): Limited web presence
- Stage 2 (Enhanced): Easily accessible information on policy
- Stage 3 (Interactive): Online services and interactive portal sites
- Stage 4 (Transactional): Two-way interactions and online transactions
- Stage 5 (Connected): Seamless online service and integrated back office

The other associated terminologies emerging from the current discussion on "smart" are smart city, open government, big data, and so on. A working definition of smart city is provided in Gartner's report which defines a smart city a city with sustainable capacity over time to generate economic development. It is an urban area functioning and articulated by modern information and communication technologies in its various verticals, providing ongoing efficient services to its population (Gartner, Inc 2014). From a public organization perspective, open government can be seen as an evolution of eGovernment, in which the governance paradigm is achieved, and the ICT role and its degree of adoption is a key driver that has important implications (Jimenez and Gasco 2008, cited in Jiménez et al. 2015). Big data are formed through the recording and storage of traces of various acts performed by several individuals over time, such as financial transactions, social media traffic, health records, and GPS coordinates, often by means of mobile tools (Manyika et al. 2011, cited in Asquer 2015). Mellouli observes that increased citizen's engagement introduces this new form of government to engage citizens meaningfully and intelligently. Open data and smart government are likely to serve this engagement fruitfully (Mellouli et al. 2014; Kim 2013; Bertota et al. 2014).

### Public Service Innovation

The need for innovation in public services cannot be overemphasized as many observers argue that it is now more expedient in improving public services than any time in the past. Asquer sees the emergence of challenging social, economic, and political issues, digitalization of social activities, the growing call for transparency and public participation, and the increasing stress on public finance as the pretext for innovative ways of providing public services (Asquer 2015). Albury's decade back observation was somewhat similar: "Innovation is essential to the improvement of public services; it is not an optional luxury but needs to be institutionalized as a deep value" (Albury 2005). Mulgan and Albury define public sector innovation as the design and implementation of new processes, products, services, and methods of provision, resulting in significant improvements in terms of efficiency, effectiveness, or quality (Mulgan and Albury 2003, cited in Alves 2013). As in the private sector, management innovations do take place in government as a part of the process, particularly at policy planning and service delivery levels, but often, such innovations get unnoticed due to lack of incentives and motivation in government to publicize such developments (Kaul 1997). Moore and Hartley, two champions of pubic value, recognize innovation as an important way to improve the standard of public services, both in terms of increasing quality and addressing public value (Moore and Hartley 2008). Some of the writers have stressed on the impact of innovation in increasing efficiency and effectiveness of public service programs (Albury 2005; Osborne and Brown 2011). Drawn from the United Nations awards made annually for the best public sector practices and innovations, some public sector innovation enthusiasts like Alves have advocated for "co-creation" in public sector. Borrowing the concept of "co-creation" from Prahalad and Ramaswami (2004), Alves refers to the joint creation of value by the organization and the customer. It is worth remembering that decades ago in the early 1970s, Gilman raised

many significant questions about who chooses the goals of innovation and who benefits from innovation; is it public policymakers or the innovators themselves? Gilman then proposed that technological innovation must be socially controlled and people should play a greater role in the choice (approval or rejection) of innovation (Gilman 1971).

### Public Service Quality and Quality of Life

Ovretveit places "public service quality" within the overall framework of total quality management (TQM) and defines public service quality as "meeting the needs of those most in the need of the service, within higher level requirements, available resources and at the lowest cost within the TQM strategy of organizational and attitude change for enabling staff to learn and use quality methods in order to reduce costs and meet the requirements of customers" (Ovretveit 2005). In service delivery, the term "quality" is more widely perceived by Bovaird and Loffler, who think that quality ranges from "fitness for purpose" (i.e., meeting organizational objectives) to "meeting customer expectations" (i.e., deriving service excellence from customer psychology) and even to the extent of "passionate emotional involvement" (i.e., going beyond language and number) (Bovaird and Loffler 2009). Bovaird and Loffler go beyond quality of public services to the ultimate value of "quality of life" (Bovaird and Loffler 2009).

Putting it all together, it is conceivable that there is a logical linkage between eGovernment, smart government, innovation, and service quality, leading to better quality of life. The connectivity is not a new reality; it is rather a stronger imperative as rapid changes in technology vis-à-vis human relations took place over the past decade or so. But before the study proposes a conceptual framework, Prahalad's notion of "citizen-centric governance" may offer value to discourse on an appropriate framework to analyze the role of smart government and innovation in improving citizen's quality of life in a given context. Prahalad's model is based on the assumption that the entire government and governance processes should be as transparent as possible (Prahalad 2005). Once there is a shift from a delivery channel approach (which is often described as an institution-centered government) to a citizen-centric system (where citizens form the core of development agendas), this means citizens are involved in all decisions and policymaking agendas. The gap that exists in the old institution-centered government model between the state and citizens is overcome by empowering and consulting citizens through their participation. Once citizens become active participants and no longer remain passive objects of development, then actual human development results. As the state becomes accountable and responsible, citizens' quality of life improves. The state becomes able to develop its full potential, and this in turn positively impacts on investment inflows, as is shown in the model in Fig. 2.

The study proposes the following construct for analysis (see Fig. 3). It is somewhat adapted from Prahalad but exits from the model to conceptualize a direct downward nexus between the four elements under study (i.e., eGovernment, smart government, innovation, and quality). It proposes that smart government succeeds eGovernment as a new paradigm of governance, just as Dunleavy and his colleagues (Margetts, Bastow, and Tinkler) questionably argued a decade ago that digital-era governance (or eGovernment) was born out of the ashes of new public management. The study also proposes that smart government and innovation have the potential to enable a government to bring efficiency and effectiveness in public services and ultimately achieve its goal of improving people's quality of life and happiness.

## Smart Government Model of the UAE

### The UAE's Journey from eGovernment to Smart Government

In the past few years, many countries of the world paid enormous attention to developing policies and strategies around the emerging concept of eGovernment. In terms of implementation and action, some countries have made quicker

**From E-Governance to Smart Governance: Policy Lessons for the UAE, Fig. 2** Prahalad construct on citizen-centric government

**From E-Governance to Smart Governance: Policy Lessons for the UAE, Fig. 3** Smart government, innovation and quality

progress than others and potentially succeeded in producing desired results. The United Arab Emirates (UAE), through continuous enthusiasm and initiative from its leaders and with a reform vigor with best practice adoption, has achieved greater and quicker results (Rahman et al. 2012). The coupling of quality management ideas, government performance paradigms, and excellence models led naturally to an adoption of eGovernment in the UAE at the turn of the century.

The tumultuous journey toward smart government commenced in 2001 with the launching of eDirham that was meant for online fees collection for government services. With the eGovernment strategy and the eGovernment implementation plan in place, the first eGovernment portal was launched in 2005. The next 5 years focused on developing a comprehensive strategy of the eGovernment program. The eGovernment strategy 2012–2014 was initiated with the following strategic goals:

(a) Advancing/raising the e-transformation levels in government services
(b) Improving the competiveness of UAE in the field of eGovernment
(c) Establishing advanced infrastructure and promoting cooperation between government agencies

(d) Promoting e-readiness in government agencies and governance models
(e) Provisioning legislatives to ensure the success of eGovernment initiative (United Arab Emirates Government 2012)

### The UAE mGovernment Roadmap 2013–2015 and Its Immediate and Potential Impacts

The impacts of mGovernment have to be gauged in terms of immediate tangible and potential ones. The evolutionary phase of smart government (mGovernment) transformation initiative was followed by smart government roadmap, mGov guidelines, and national-level smart government plan with a deadline to transform prioritized government services in a time frame of 2 years. This initiative is aiming to satisfy the national key performance indicator for the UAE as it is targeting the UAE to be number one globally in the Online Services Index by 2021. This indicator measures the evolution of eGovernment services or smart services in terms of availability, quality, and diversity of channels and the use of the public for these services (Prime Minister Office UAE 2014).

The mGovernment roadmap (shown below in Fig. 4) has four phases. The first and second phases (i.e., establishing the environment and assessing capabilities of government agencies) were completed in May 2015. In these two phases, an ambitious initiative with a 24 months' timeline was sponsored by The Information and Communications Technology (ICT) Fund of AED 200 million to support mobile phone applications along with other resources required, including ICT technical assistance and advice (Telecommunications Regulatory Authority (TRA) 2013). In the third and fourth phases (2015–2018), the main tasks are being implemented such as the integration of services and enhancing user happiness through a citizen-centric vision of the state. Currently, the UAE government has developed over 342 smart applications (174 for IOS and 168 for Android) to provide more than 800 services to citizens out of a planned 2000.

**From E-Governance to Smart Governance: Policy Lessons for the UAE, Fig. 4** The mGovernment roadmap 2013–2018

**From E-Governance to Smart Governance: Policy Lessons for the UAE,**
**Fig. 5** mGovernment (Smart Government) initiative structure

The Smart Government Initiative Structure is shown in Fig. 5 below. It illustrates the relationship between the different players within the initiative. The key players are the Higher Committee for Smart Government, director of smart government in the TRA, TRA smart government team, Prime Minister's office, and the UAE smart government stakeholders, which are government entities and project consultants (TRA 2015).

Clear mandates are assigned to the 48 federal entities as stakeholders and implementers. Moreover, a leading role given to the TRA as the initiative owner and enabler translated into one of its strategic objectives in the TRA's strategy (2014–2016) that is "Establishing the bases for the e-government at the federal level" (TRA 2015).

The United Arab Emirates has climbed 21 places to stand at 28th rank in the 2012 United Nations eGovernment survey of more than 190 countries. It had stood at 49th rank in 2010. The UAE has also leaped to rank 7th on the "online service index" in the United Nations E-Government Survey 2012 up from rank 99th in the 2010 version of the biennial report (Khaleej Times, February 29 2012). In 2014, the UAE achieved 32nd rank in the eGovernment Development Index in the United Nations eGovernment survey. The UAE is 2nd in GCC and the Arab world in the eGovernment Development Index, among the top 20 countries in Asia in the eGovernment Development Index, 12th globally in Online Service index, and 13th globally in eParticipation Index. Compared to 60th rank in 2004, the UAE has gradually elevated its global position in eGovernment reform record.

On May 24, 2015, the Emirates 24/7 newspaper published the results for the rate of mGovernment transition. As resulted from the evaluation of the first phase of the initiative, the success rate of smart transformation index stood at an impressive 96.3% for the most important 337 services as prioritized by the government entities and PMO (Emirates24/7 2015; Bernd 2015). The education sector in particular was spotted as an underperformer in this transition, but all other sectors have done almost equally well with the energy sector ranking the top position.

The next stage in the country's mGovernment journey will entail linking all the services

together, improving the quality of smart applications, and achieving a high satisfaction rate for smart services. It targets raising the number of smart services users to 80% of a total number of around 1000 services by 2018 (Emirates24/7News 2015). This future phase is supplemented with defined strategic KPIs for the mGovernment sector in the TRA (2017–2021) which monitors and measures the federal entities' commitment with mGovernment enablers, development of the mGovernment and eGovernment services maturity index platform, and the initiative of smart maturity for federal government services and performance (TRA 2014).

The significant accomplishment is the enactment of Dubai Data Law which stipulated that all data which is not personal, sensitive, or confidential is to be made public. The law also requires strategic private companies to open their data except those sensitive and confidential. Salem (2016) summarizes the potential impact of the data law that is expected to contribute to economic growth and raising the standards of living through:

(a) Enabling the creation of new business and employment opportunities
(b) Facilitating tripartite relationship between the government, the private sector, and individuals
(c) Improving the efficiency of managing and using data and creating new innovations and services in the city (Salem 2016)

Further to these tangible achievements, the Smart Dubai Task Force got indulged in mapping the current state and gaps, benchmarking 76 practices based on the experiences of 12 smartest cities in different continents, and collaborating with the International Telecommunication Union for developing indicators (key performance indicators) to measure the progress (Salem 2016).

The organizational setup has also undergone substantial changes following the enactment of the new law and regulations. The Smart Dubai Office has been established with substantive jurisdictions aiming to nurture collaborative projects and initiatives (Salem 2016). While all the key partners have played their due roles, the role of the TRA in facilitating the achievements so far made in the journey toward mGovernment is very significant. The TRA's main contribution was to provide the necessary technical support for mGovernment infrastructure, benchmarking, gap analysis, training, and consultation for all federal government entities and oversee the implementation of the mGovernment strategy. However, it is the role of the Office of the Prime Minister that played the real enabling role in the total process (Personal Communication, February, 2016).

In recognition of its efforts in implementing spatial data infrastructure (SDI) and driving the cooperative use of geospatial information across a wide range of government entities in Abu Dhabi, Abu Dhabi eGovernment was the inaugural recipient of the first-ever "2015 Smart Government Award" launched by the Environmental Systems Research Institute (ESRI) User Conference, held in San Diego, California, in the United States on 20–21 July (Abu Dhabi eGovernment 2015). The deployment of the Emirates ID Authority's Biometric Enrolment by the Emirates ID Authority as part of the National ID Registration Program is recognized as one of the world's best biometric programs (United Nations 2014).

## Public Service Quality and Happiness

The UAE's leadership realized early on people's needs to be fulfilled, concerns to be addressed, and objectives to be realized in an evolving era of globalization and technological innovation. The Vice President and the Prime Minister of the UAE, Sheikh Mohammed Al Maktoum, rightfully captured governments' essence in his book – as means to an end, ought to deliver on public promises – creating values that match people's hopes and outcomes that can instill common happiness among citizens (Al Maktoum 2013; Al Maktoum 2016).

The city of Dubai has already launched "happiness meter" across all government entities, both online and real-life touch points. Service receivers

give their response on the level of happiness while interacting with the public service providers. By early 2016, one million responses were gathered for 31 government establishments. All data are then inserted into a Happiness Meter Index (HMI). The future plan is to scale up this initiative to include the private sector and other entities (Salem 2016).

The Emirates Identity Authority has announced that it has amended one of the corporate values enlisted in its strategic plan 2014–2016 from "focus on the customers" to "making the customers happy." It also fixed a daily indicator to measure the happiness of its customers and their satisfaction about its performance and services. The Emirates ID said it has begun to develop the mechanisms for measuring the happiness of its customers on a daily basis in terms of an integrated online system that allows them to evaluate the services and performance. This will help the process of constantly improving the level of services offered to the customers, as their feedback gets instantly transmitted to the leadership in real time (One1Info 2015).

Care for happiness, tolerance, and youth has been exemplified by a landmark institutional reform in the UAE. Ministerial portfolios have been overhauled, and three new ministries – happiness, tolerance, and youth – have been established. The rationale for such a massive change is clear. In his well-orchestrated write-up, the UAE Vice President and Prime minister has emphatically observed "Failure to respond effectively to the aspirations of young people is like swimming against the tide. . . . We need to study, teach, and practice tolerance – and to instill it in our children, both through education and our own example. . . . . There can be no bright future for the Middle East without an intellectual reconstruction that re-establishes the values of ideological openness, diversity, and acceptance of others' viewpoints, whether intellectual, cultural, or religious. . . . The happiness of individuals, families, and employees, their satisfaction with their lives and optimism for the future, are crucial to our work, which cuts across every sector of government" (Al-Makhtoum 2016).

## Smart Government Challenges

For the UAE, the thrust of the smart government reform was to take advantage of technology as a tool to connect people closer to government and to facilitate the delivery of integrated public services through smart phone application. The 2-year reform journey (June 2013–May 2015) has shown remarkable success in terms of a smooth transition from eGovernment to mGovernment. Subsequently, the country has set new milestones to achieve further results between now and 2018. However, there have been a few concerns at the policy level: (i) a number of public organizations have failed to pull alongside other champion entities, (ii) a somewhat low usability by the government clients including citizens and businesses, and (iii) the mobile services and apps have not been fully integrated yet.

Discussions with three key officials of the smart government team at TRA also corroborate the abovementioned challenges. The main challenges in the process of transformation as indicated by the interviewees are the differences in culture and capabilities of different government entities, lack of time available, and budget control for the transformation projects by each entity and the TRA. Two of the interviewees agreed that resistance to adapt to the change by many entities as they were not able to deliver the outcomes during the duration set by the leadership of the country is also a major challenge. Though these challenges have been eased to a certain degree, they still remain in place (Personal communication with TRA officials, February, 2016).

Another important challenge revealed from the discussion is the difficulties that lie between the federal government and local government entities. Apart from this, keeping pace with technological advancements in terms of the types of platforms, big data, IoT, smart cities, cloud computing solutions, etc. remains a huge challenge to achieve the prospect targets set for the upcoming stage till the end of 2018 (Personal communication with TRA officials, February, 2016).

Adequate monitoring and motivation may inspire the organizations, who have trailed behind, to improve their infrastructure and

organizational modification to comply with smart institutional setup. To increase citizen participation and provide citizen-oriented services, there is a need to offer easy access to mGovernment information in alternative forms (e.g., awareness, community-based voluntary activity, and citizens' participation campaigns). Wireless and mobile networks, infrastructure, as well as software and apps need to be developed and provided through integrated platform. To build customer trust on data security and safety, legislation on data protection, spelling out the rights of citizens, and the responsibilities of the data holders may be initiated. The abovementioned issues need to be addressed by the TRA and smart government departments of the Emirates in a collaborative manner to ensure that the UAE's smart government policy agenda makes steady progress in the coming years.

## Conclusion

Based on a simplified conceptual framework on the evolving relationship between eGovernment, smart government, innovation, and service quality, this exploratory research aimed to examine the smart government journey, its pitfalls, and future challenges. The implementation of the first phase of smart government in the UAE has shown astonishingly good results in achieving a high-level transformation status from eGovernment to smart government. This will potentially inspire the governments across the Emirates to continue to deliver public services through the mobile platform. This good practice (and good model) can also inspire countries in the Middle East and North African region to appreciate and follow similar trail to improve their public service record and to satisfy their citizens. In fact, the UAE is a case that brings hope globally, not least in the Arab world.

Despite the progress made, citizens' adaption to smart life is somewhat low and thus it needs to be given policy attention. Also, the apparent disparity in resources and motivation between some Emirates compared to other "leading-edge" Emirates needs to be bridged. And most importantly, all IT-based mobile services should be integrated on a platform. Now that the development of ICT infrastructure has been undertaken, the reformers' onus should be on improving the level of awareness and confidence among the citizens to build their trust and inspiration to engage in a vibrant citizen-state interface. Through these approaches, the UAE government will be able to improve the rate of usage on smart government platforms.

The UAE's leadership has well responded to the NPM and post-NPM (i.e., smart governance) reform paradigms in a timely manner. It inspired reform emphasizing on service quality, efficiency, and excellence and is now focusing on mobile-based smart services. The leadership vision, smart governance, and citizen engagement will together make the case of smart society a reality.

# From Governance to Government

Ann Marie Bissessar
Faculty of Social Sciences, The University of the West Indies, St. Augustine, Trinidad and Tobago

## Synonyms

Administration; Public administration; Supremacy and ruling

## Definition

Government involves the political direction and control exercised by members of a governing body over its population.

Government is a form or system of rule by which a state or community is governed.

Government is a system of polity in a state.

## Introduction

Numerous definitions of the word "government" abound. Government, according to one definition, involves the political direction and control exercised by members of a governing body over its population. Another definition is that government is the form or system of rule by which a state or community is governed. If one examines the legal description of the word "government," it is evident that the meaning of government is more extensive. For instance, government involves the regulation, restraint, supervision, or control which is exercised upon the individual members of an organized jural society by those invested with the supreme political authority, for the good and welfare of the body politic, or the act of exercising supreme political power or control.

Another definition is that government is the system of polity in a state, the form of fundamental rules and principles by which a nation or state is governed or by which individual members of a body politic are to regulate their social actions, and a constitution, either written or unwritten, by which the rights and duties of citizens and public officers are prescribed and defined, as a monarchical government and a republican government.

Another, shorter version defining the term is that it is an empire, kingdom, state, or independent political community, as in the phrase, "compacts between independent governments." A wider and more expansive version is government can be described as the framework of political institutions, departments, and offices, by means of which the executive, judicial, legislative, and administrative business of the state. In an examination of the term government then (noun), a number of elements can be distilled. Firstly, government comprises a group of persons – elected or nominated or sitting by way of inheritance such as in the case of a monarchy. In some cases, this "group" could be expanded to include institutions, departments, or even offices. It could also be

based on laws such as a constitution. Further to this, the role of this body is not limited but encompasses the judicial, legislative, and the executive arena. Finally, this group has "supreme" control over its populace.

## Changing of Governance to Government

In dissecting the term "government," a number of features can be clearly established. Firstly, the term suggests that decisions are made by a small, elite group. Secondly, that little or no discussion with the wider population and the decisions taken by the politicians, albeit for the good of the populace, are merely disseminated to the wider population. In addition, it is evident that in most systems of government, there are three major arms, namely, the legislative, the executive, and the judicial arm. In Westminster systems or their modified systems such as the Westminster Whitehall model of government which exists in the case of the countries of the English-speaking Caribbean, these arms are theoretically separate and apart. This concept of the separation of government responsibility into three arms was first developed in ancient Greece. Under this model, governmental power is divided into branches, each with separate and independent powers and areas of responsibility so that the powers of one branch are not in conflict with the powers associated with the other branches. In his *The Spirit of the Laws* (1748), French philosopher, Montesquieu, described the separation of political power among a legislature, an executive, and a judiciary. His major argument to support this arrangement was that powers should not be excessively centralized and each arm of government should serve as a check and balance on the other. This model of government formed the basis for both the presidential as well as the parliamentary systems of government.

The governmental model relied on centralized control, set rules and guidelines, separated policymaking from implementation, and employed a hierarchical organizational structure. In many systems, particularly in the Anglophone Caribbean, the overarching authority was a written constitution. The constitution set out or prescribed the guidelines under which different authorities reported. Thus, the constitution established the role and functions of the parliament (which comprised in the case of the Anglophone Caribbean, the house of representatives and the senate) and the functions of the judiciary and the executive which comprised the public sector.

Some of the central features of this model, also, included a separation between politics and elected politicians on the one hand and administration and appointed administrators on the other. With respect to the public sector, the administration was continuous, predictable, and rule-governed. The administrators in this sector were appointed on the basis of qualifications and were trained professionals. There was a functional division of labor and a hierarchy of tasks and people. This "command-and-control" approach to public administration was the reference point for bureaucratic systems introduced around the world which were formerly under colonial rule and later attained independence.

By the 1990s, however, it was evident that there were some fundamental flaws with the old method of government. One of the primary concerns was the "slowness" of government. Indeed, the executive or implementing arm of government, the public sector, was often criticized for red tape and excessive delays in the delivery of goods and services. It was also felt that government was unable to respond in a timely fashion to the changes in the environment as a result of global forces. Additionally, the typical "welfare" culture of government which prevailed prior to the 1990s, as a result of economic pressures, could no longer be supported. It is suggested that a number of forces converged so as to lead to attempts worldwide to reform the old method of government. Many suggest that one of the major pressures was the force of globalization.

Globalization, as it should be recalled, had a number of dimensions including a social, cultural, as well as an economic dimension. It was perhaps the economic dimension that created an intensified exchange between states and a number of different international organizations. According to Rhodes (1996), these dependencies

fundamentally changed the conditions for both politics and administration. Pollitt (2003) and Jessop (2002) suggested that perhaps the variety of social forces, such as increased complexity in social problems, a growing and more specialized public administration, increased demand for expertise, internationalization, decentralization, and a rapid development of information and communication technologies, were also at play. The end result was that countries around the world shifted from a system of government to a system of governance.

Strangely, the definition offered for governance was not significantly different from the definition of government. Governance according to one definition was the exercise of political, economic, and administrative authority to manage a nation's affairs. This model, too, was perceived as complex, comprising mechanisms, processes, relationships, and institutions through which citizens and groups articulated their interests, exercised their rights and obligations, and mediated their differences. But, the governance model was different in that it entailed a fundamental shift from the traditional hierarchical form of organization to the adoption of a more inclusive form of governance. The top-down approach where decisions were formulated at the top of the hierarchy was now replaced with a participatory form. Two major actors apart from the politicians were now included in this model, the civil society broadly conceived and the private sector. The intension of this new mode of governance was to include all the partners in the county in dialogues or discussions of public policy. In other words, there was a shift in emphasis away from command and control in favor of more "regulatory" approaches. These approaches were less rigid than the former government arrangement, less prescriptive, and less committed to uniform outcomes. Theoretically, this new arrangement was one in which the views of all the stakeholders in the society were considered.

Apart from the shift in political decision-making arrangements, new organizational arrangements within the public sector were also introduced. For instance, in many countries around the world, including the Anglophone Caribbean as well, there were attempts to remove the monopoly within the public sector by introducing private sector techniques including competitive tendering of goods and services. Accordingly, countries in an attempt to move away from a monopolistic bureaucracy experimented with privatization, quasi-privatization, the introduction of executive agencies, as well as devolution of activities from central ministries to devolved authorities. The term networking as well as networking systems was introduced as a way of breaking the bottlenecks within the traditional bureaucracy.

Governance therefore was a move away from the traditional hierarchical form of organization to network arrangements. This new arrangement, it was believed, would lead to faster responses to environmental demands. There also was a revision of the relationship between state and civil society in a more participatory direction. Apart from structural changes, the introduction of the "new" governance also led to changes in lawmaking as well. Governance was deemed to be responsible for shifting the emphasis away from statute law to more flexible forms of regulation and implementation. The state, some suggest, thus claimed to be superseded by a "networked polity" where authority is devolved to task-specific institutions with unlimited jurisdictions and intersecting memberships operating at sub- and supranational level.

But it was not only the arrangement of "governance" or law that became the focus. Later, a comparison would be made about what was termed "bad" governance and later "good" governance. "Good" governance comprised eight primary characteristics. It was felt that this model of governance was participatory, consensus oriented, accountable, transparent, responsive, effective and efficient, equitable, inclusive, and adhered to the rule of law. Under this model of government, it was felt that corruption was minimized and that the voices of the most vulnerable in the society were heard. The concept of "good" governance further extended to local governance, and 12 principles were enunciated.

The first principle of good governance at the local level focused on the fair conduct of elections, representation, and participation. Other principles focused on issues of responsiveness of

the government to the needs of the citizens, efficiency and effectiveness, openness and transparency particularly with respect to accessing of information, the rule of law, ethical conduct of public officials, competence and capacity, innovation and openness to change, sustainability and long-term orientation, sound financial management, human rights, cultural diversity and social cohesion, and finally accountability.

## Conclusion

Farazmand (2004) contends, however, that the concept of "good governance" as defined by the UNDP stems from two major factors. The first factor has to do with the triadic relationship between the state, civil society, and the private sector. This interaction, according to Farazmand (2004), ignores one primary force, namely, the international global power structure. Within this global power structure are the elite actors. These actors he suggested, has to a large extent, replaced the nineteenth century colonialism with imperialism. Another critical issue highlighted by Farazmand (2004) is more normative. He observes the concept of "good" or "bad" is purely the measurements that are introduced by the global elites to suit their particular agenda. Farazmand (2004: 11) states a more concise definition of governance as follows:

> Governance here means a participatory process of governing the social, economic, and political affairs of a country, state, or local community though structures and values that mirror the society. In includes the state as an enabling institution, the constitutional framework, the civil society, the private sector and the international/global structure within limits.

Governance, as defined above, therefore not only takes into account the triadic partnership with the country but extends to the international actor as well.

## Introduction

As I stand in front of the classroom, I see a sea of raised hands. A classroom full of undergraduates, each with untold potential and possibility is voting for something they don't fully understand.

"Are you sure?", I asked, hoping for the reconfirmation of their decision.

They nod.

Can someone please explain to me what you will be doing day to day?

Silence.

So how do you know you want to do it?

Silence.

I let the silence linger. I wanted the room to feel uncomfortable.

I had been teaching entrepreneurship for my fourth semester. The class was officially called Principles of Success, but in practice, it was an introduction to being an entrepreneur. In front of me was a class of undergraduate students, bright, hardworking, ambitious. They could choose any career path, but they choose this one.

They all choose to be an entrepreneur, but they don't know what they are getting into.

## The Entrepreneurship Phenomenon

This phenomenon sweeps across our country. Years of watching, reading, and seeing college grads and 20 somethings start companies are making an impact. It's breeding a generation of people that want to start their own companies. To build something that can bring to the market. To chart their own course. To be an entrepreneur.

As exciting as it sounds, the numbers tell a different story. Most of the people in that room will give up on that dream. Others will start their own companies and fail after just a few short years. Others still will follow their dream and not achieve the financial success they dreamed of. Only a small fraction will realize the potential they have sitting in that classroom.

Why? Why do so many entrepreneurs fail? While there is a plethora of reasons, I would like to share what I believe to be the greatest.

Clarity.

Great entrepreneurs don't aspire to be entrepreneurs. They are not focused on what to call themselves. They are too busy focusing on their product or service. On their offering to the market. Their focus was on their idea not on their designation.

To be successful, you have to know what you are building. What you are sacrificing for. Success begins with clarity. Clarity of expectations, clarity of purpose, and clarity of focus.

It starts with a vision.

## Vision

A vision is a mental image that portrays a future world where our deepest aspirations have been realized. It is not an ambiguous, blurry picture of what one would like to have accomplished. It is a clear picture of a future that includes the very idea that you desire to bring to fruition.

Most ideas fail not because they merit but because they lack clarity. The incompleteness of the image gives those engaged with its execution license to infuse their own interpretation. As more people get involved with an incomplete picture of a future, greater discrepancies form. That is how teams can work side by side but with divergent trajectories.

This may be hard to spot since there are multiple points of overlap, but over time the differences in what is being built or offered start to accumulate. Execution stalls as resources are used inefficiently, and facing rather typical market headwinds, the original starts to falter. . .and then fail.

The challenge, and responsibility of an entrepreneur, is to create a clear path to traverse. Albeit the input of colleagues and mentors are necessary, but the responsibility of the vision and its articulation falls on the shoulders of the entrepreneur. The vision is not a list of goals; it is the unifier of goals, giving purpose to everyone's checklist.

Setting a vision is a fundamental attribute of effective leadership and a basis of one's power to lead. It is the ability to create a cognitive image of a desired future state. Successful entrepreneurs work on that image until it is clear enough not only to themselves but also to those around them, lifting them out of their day-to-day existence, injecting meaning into their lives in pursuit of that goal.

## Elements of an Effective Vision

How does one craft a strong vision? Try following these three elements:

### Futuristic

A vision has to give a glimpse of the future. However, it can't just be in the future; it has to be at the right distance in the future.

Too often, our vision becomes short-sighted. Life has a way of keeping us busy, and as the daily task list increases, our eyes focus on what has to be done in the near term. Days become weeks, months, and years and our eyes have barely lifted. Add the constant demands of our smart devices and most people aspire to just "get through the day." The strongest stretch to reach the weekend in one piece.

To many, the vision extends as far as the next vacation.

For a vision to be effective, it has to look far enough into the future where exponential change becomes possible. Where today's impossible becomes possible. From that vantage point, the challenges of today do not cloud the idea. It gives a certain clarity to what is possible to bring to fruition. To innovate. To create or adapt.

However, this future period can't be too distant. If our vision is too far away, it will fail to create an urgency in the moment. The lure of comfort will not be matched against the excitement of accomplishment. Such a vision may create incredible possibilities but won't charge the team with its execution, leaving its fate to die on the paper in which it was written.

Start by identifying a date in the future. For some, it can be a decade. For others, it could be 5 years.

### Ambitious

A vision is not meant to only be a mechanism for clarity. It is also a mechanism for encouragement, enthusiasm, and motivation.

A vision should motivate you. The articulate of a future that includes your aspiration should provide you with the emotional energy that will enable you to sacrifice your present in anticipation of the future.

For that to take place, the vision has to vacillate between two concepts: real and ideal. On one hand, it has to be idealist and ambitious. It should challenge you to reach higher. It should paint a future worth sacrificing for. On the other hand, it needs to be realistic. It needs to be attainable and achievable, or your rational mind won't allow you to give it enough credibility. It should be realistically ambitious.

The key is to not be bound by your current constraints. Allow yourself to move to heights that are beyond what you normally think, beyond what you typically envision, but make sure there is at least some possibility of actually getting there, even if that possibility is remote.

That possibility, if articulated correctly, should be a source of motivation.

### Expression of a Deeper Purpose

A vision is not merely an articulated path to a material pursuit. For us to be motivated to work tirelessly in pursuit of our vision, it needs to express something much deeper.

Great companies are not in existence to just make money. They aspire to make a difference. They don't have to be a nonprofit to make a difference. A company can build a product or deliver a service with great commercial success while aligned to a deeper purpose.

Great entrepreneurs understand that their organization reveals its consistent identity, which extends way beyond the service or product. It's the central glue that holds the organization together. It's the foundation of a system of guiding tenets or enduring principles that bonds people from different places.

It's essential, enduring, and intrinsic. It is independent of the environment, competition, or market. It needs no external justification, and a company would hold on to it, even if they were penalized for doing so.

Why is this so important? Why not just get started and you'll iterate as you go?

Because you need to leverage your most powerful resource, your mind.

## Neuroplasticity Explained

Our mind is made of billions of neurons, forming complex neural maps that enable us to function as human beings. Some of these neurons were interconnected from birth, enabling us to survive. No one has to teach a newborn to breathe or cry or suck. They are born with those skills and have the corresponding neural connections to go with them.

There are, however, neurons that are not connected. They are separated by a space called the synaptic cleft. They exchange information by sending electrical or chemical messages, or neurotransmitters, across the synapse. When one neuron connects to another, it triggers an electrical impulse that causes the neuron to "fire." As

neurons fire repeatedly, molecular alterations occur in both of them, and their relationship strengthens. Their connection grows stronger, and they eventually become wired together.

This concept, introduced by famed Canadian neuropsychologist Donald Hebb, is known as Hebb's Law, and it's summed up by the phrase, "Neurons that fire together, wire together" (Ferrández et al. 2013).

Thought is the building blocks of your mind. They connect neurons to each other, remapping our brain to adapt to new knowledge, language, and skills as we navigate through life. The more you reinforce those thoughts, the stronger those connections get. So, the simple act of thinking either makes new connections or fortifies your existing ones. But thought doesn't require experience. Thought can replace experience. Since our brain can't tell the difference, by imagining a scenario repeatedly, it can have a similar impact on our brain as experiencing it.

For an entrepreneur, a well-articulated, realistically ambitious, clear vision is not a luxury; it's a necessity. The more engaging a vision is, the more it gets repeated, and the higher the likelihood that it gets "wired" into the minds of its team. As thought leads to new neuro-connections, the vision feels more and more familiar. This cognitive familiarity impacts not only the decision-making of the group, but belief in its occurrence rises significantly (Carroll 1978).

The envisioned future, when repeated, creates an emotional connection to the image and plays a key role in behavioral responses in the present, enabling the team to believe in its possibility and work more efficiently to its achievement. Because such simulations allow individuals or even groups to imagine or "pre-feel" their place in a future scenario, repeated future imaginings might be linked strongly to long-term strategy or decision-making (Gilbert and Wilson 2007).

This emotional component, or lived future experience, could play a key role in any behavioral responses in the present, despite the context of the future imagined event being different from that of today. In fact, the research shows and states that an organization with a well-articulated vision can achieve sustained competitive advantage over those organizations lacking such a vision (Hamel and Prahalad 1989). In fact, that vision is ultimately a cognitive construction or specifically a mental model, a conceptual representation used to both understand system operations and guide actions within the system (Mumford and Strange 2005.

## Exercise

Set aside a block of time, when you are least distracted – on a plane, in a coffee shop, at the office after everyone else has left, or at a quiet time in your house, maybe after the kids have fallen asleep.

Take out a piece of paper, open your laptop, or use a notebook. Pick a date in the future. Make it a specific date. It could be 5 years out, maybe a decade, or maybe at your 50th birthday. Find a date and make it specific. Then visualize yourself on that date in the future.

Imagine as if you have, outrageously enough, created the project or company you desired. What do you see that is happening around you?

Here are some questions to consider: (1) What are you doing during the workday? (2) What have you accomplished? (3) Who is affected by your work? (4) What is the impact of the larger community?

Start to write out exactly what that day looks like as if you are observing yourself as if you were given a time machine to go to that date in the future and watch yourself. Really try, as if you're writing it as an observer, to get as much of that day as possible.

What have you brought to the world? What does your product look like? Who is it servicing? What does your company do? What impact is it having on the world around you?

Use these questions to start stimulating ideas and don't stop writing. Don't edit. Don't judge. Don't wait for the right answers. Just write. Get underneath what you want to build so you start seeing what it is that you really want to do.

## Goal Setting

The late Dr. Stephen R. Covey, famed author of the international bestseller The 7 Habits of Highly Effective People (1989), once illustrated his approach to success in front of a packed convention hall. He called up a volunteer, who was asked to attempt to fit various rocks into a clear plastic bucket. The rocks differed in size, ranging from larger rocks down to pieces of gravel, and each was affixed with a different label, such as family, work, spirituality, and exercise. The volunteer surveyed the group of rocks on the table and instinctively picked up the smallest stones first and placed them in the bucket and then picked up increasing larger rocks. As he advanced, the volunteer experienced increasing difficulty finding room in the bucket for the remaining rocks. Ultimately, despite all effort, there was simply not enough room in the bucket for all the rocks to fit.

After the volunteer gave up, Covey produced a new, empty bucket and suggested that the volunteer start again, this time placing the larger rocks in first. Following instructions, the volunteer began placing the larger rocks into the bucket. After all the big rocks had been placed, the volunteer then added the smaller rocks and finally the gravel. They all fit into the bucket. The crowd applauded.

Covey then commented on the lesson they had just learned. Life is complex, he explained, filled with a plethora of goals, needs, and interests. One might think that success is limited to those who either limit their aspirations (don't have so many rocks) or simply find more time in the day (get a bigger bucket). There is, however, a third route to success, and that is to prioritize wisely. The big rocks represented one's most important goals and values, and the lesson was simple: Those need to go in first, they need to be prioritized. Once they are in, there will be room around them for everything else.

## Prioritizing as Integral to Success

The first step of entrepreneurial success is crafting a compelling vision. Vision will bring clarity and an expression of new tasks and goals. However, there is a potential trap. Not all goals are created equal, and some tasks can actually detract from the mission. That is why execution is not enough. You need an execution strategy.

At the core of an execution strategy is the determination of the relative "sizes of the rocks," identifying which are the "big ones" – one's primary goals and values – to ensure they go in the bucket first. Unfortunately, it is all too common that we instinctively try to take care of the "small rocks" first, eventually discovering that the big ones got left out.

The great shock of an entrepreneur is recognition of the plethora of details that one must focus on to effectively launch, manage, and run a company, and all against the backdrop of an incessant bombardment of messages, texts, emails, and calls.

It is no wonder that he feels as if he is jamming rocks into an already filled bucket. It is almost inevitable that he will become extremely frustrated and, in many instances, unfulfilled.

So how is one to do it all? How does one achieve success while simultaneously retaining a semblance of peace of mind? How are we to fit so many big rocks into our limited-capacity buckets?

## Setting Priorities by Refining Goals

It is an all-too-common malady that people tend to adopt de facto goals that do not reflect their vision. Such a disconnect will almost inevitably result in frustration, even if the goals are spectacularly achieved. It is, therefore, critical that each person review the connection between their deeper aspirations and the goals they have set for themselves, as well as how they measure success.

Although there is no magic formula for setting appropriate goals, below is a suggested process:

### Articulation

Life choices must be guided by goals. The first and perhaps most challenging exercise is identifying the goals one has already chosen – consciously or not – and that are already guiding one's day. Many people make daily choices

instinctively or without thorough consideration of the underlying goals and values that ought to influence these choices.

Most people do not have the tools to explore the reasoning behind their goals and how it connects to their actions. They are running too fast and are too busy for such an activity. For them, and many others, busyness can be a comforting feeling. While they may be busy, they are not being productive, in that they are not moving meaningfully to their vision. To see this disconnect, actual articulation of the goals is a helpful effort that often triggers a deeper understanding of motivations and aspirations.

Most people, at least deep down, have a good sense of what objectives they should and should not pursue. By failing to articulate their goals, however, they lack the perspective necessary to allocate their time and effort properly. Moreover, if the goals are not clearly and deliberately articulated in advance, neither objectives nor actions will be deeply grounded, possibly resulting in ill-advised changes in direction or focus as a response to some new inspiration or idea.

By failing to spend the time to articulate our goals to achieve our visions, we subject ourselves to the allure of any new and exciting opportunity that shows some promise. We are then at risk of jumping from objective to objective, with no long-term stability. True success and satisfaction, however, are typically achieved through a long-term commitment to substantial and meaningful objectives. Goals are the directional flags of your life. If you want to achieve success, then start by investing time articulating your goals.

### Identify the Motives Behind the Goals

Once goals are determined in a thoughtful and fulsome manner, the next step is actually to question one's own motivations in selecting these specific goals. One must ask, "What made me choose these particular goals and leave out others?" "How does this goal get me closer to achieving the overall vision?"

The exercise of connecting goals with their true motivations is not intended as a judgmental process, nor does it necessarily reflect how proper any actual motivations may be. The exercise is necessary because curiously, success in achieving goals is dependent on the underlying motivations in pursuing those goals in the first place.

Since your vision is linked to who you and how you see the world, it provides an anchor for your day. Our days are bombarded with messages, emails, and images sent to us by someone else. Our emails are the checklist of the questions and problems of other people, and our smartphones are the billboards of brands and products. If we are not vigilant to protect our time, we will find ourselves busy but unproductive for most of our day.

Entrepreneurs are uniquely challenged in this area since most work in a less structured environment. They lack the usual management found in more bureaucratic institutions. They tend to not have, or do well with, quotas or time sheets. The freedom that an entrepreneur has can be his or her Achilles' heel. With an imposed structure, distractions can be more tempting. This could lead to disastrous consequences as tight timetables and resources threaten the viability of a startup, and without consistent, productive work time, the likelihood of success starts to dwindle.

However, even when the entrepreneur is working, the goals set forth may not be on target. A misplaced goal may have a greater negative impact than a social media post. Such a goal may consume hours, or days, leaving little impact on the ultimate vision. The hours were dedicated to working but the work done was not properly aligned with the overall objective.

If you extend such misalignment to a team of people, you begin to understand how even smart, ambitious, hardworking people can fail to accomplish their ultimate goals, and not even realize why. The reason is first the prioritization of goals, and then the unification of each goal to the overall vision.

### Adjust Your Goals to Envisioned Obstacles

Two researchers from UCLA, Lien Pham and Shelley Taylor (1999), conducted an interesting experiment exploring the impact of visualization and goals. They took through groups of students and gave them three distinct instructions about their exams.

The first group was instructed to visualize themselves getting an A in the class. All they had to do was picture that result on a daily basis. The second group was instructed to visualize the process leading up to the exams. This included not only studying and test-taking but potential distractions and challenges and ways that they would overcome them. The third group was given no particular instructions.

While the first group envisioned the result, the second envisioned the process. That made all the difference. When the results came back, the first group, who pictured their goal, scored the same as the group that made no change. The second group, who pictured the process scored 6–10 points higher: a full letter grade. This research gives light to the interplay between vision and goal setting. It shows how not only must we know where we are going (vision) but how we plan to get there (goal setting).

When you are establishing your execution strategy, spend the time envisioning the process toward your vision. What obstacles do you anticipate facing? What challenges do you expect to come your way? How do you plan on dealing with them? It's from these ideas can you create a stronger execution plan. From these thoughts can you build paths to navigate around blocks that will emerge in months or years later.

By merging these three areas, (1) articulation, (2) motive, and (3) adjustment, you can create a dynamic process of execution that enables you to see what's behind your actions and connect them to what you need to be doing to achieve your goals.

Dr. Robert Spetzler (Oyesiku 2019) is one of the world's greatest neurosurgeons. Spetzler has treated more than 5,000 aneurysms and has performed surgeries as daring as the "deep hypothermic circulatory arrest," a surgery which puts patients through a managed clinical death, deliberately halting their heartbeat and brain function while on the operating table.

Dr. Spetzler uses visualization before every surgery. He calmly walks his mind through every aspect of the entire surgery ahead of time, so by the time he gets to the operating room and gets inside his patient's head, he feels like he's performing the surgery for the second time. When Spetzler finds himself in uncharted territory in the middle of a surgery, he goes back to his visualization. He creates a mental image of what should happen and transfers that into the operation. He knows where he's headed. And should anything go wrong, he's able to handle it without panic because he's already thought everything through – kind of like a Navy SEAL getting ready to get into the water.

## Conclusion

It's hard to launch a product or service. It's hard to build a company. With all the necessary time and resources, the one thing that is in your control is clarity. Building a strong vision and an execution strategy is critical for success in whatever area you are engaged in but especially if that area is as an entrepreneur.

## Frontline Bureaucrat

Roberto Falanga
Instituto de Ciências Sociais, Universidade de Lisboa, Lisbon, Portugal

### Synonyms

Administrative training; Bottom-up approach; Bureaucracy; Discretionary power; Field-level practice; Local governance; New governance; Policy implementation; Policy networks; Politicization; Public administration; Public officials; Public participation; Public policymaking; Street-level bureaucrat

### Definition

Frontline bureaucrats work daily in the field with the wider public in service delivery. According to recent transformations in policymaking processes, frontline bureaucrats are increasingly required to interact with a wide range of social and economic agents.

### Introduction: Political and Administrative Powers

Bureaucratic organizations were set up within the political-administrative and legal framework of the nineteenth century to prevent civil society from arbitrary political actions. The central premise of the Weberian ideal type of bureaucracy was the establishment of standardized codes of behavior and legal rights for public officials with lifelong careers, in contrast to elected officials who are democratically and cyclically mandated to provide political directives. The autonomy of bureaucracy was, thus, conceived as a key feature that could be used to separate powers between elected and public officials. However, the rationalization of administrative work has been criticized for having brought ineffective influence over the ways bureaucrats relate each other. Where bureaucratic formalism provides a greater level of control for political representatives to exert power over public officials, there exists a basic tension between the hierarchical downward flow existing in bureaucracies and the unequal accumulation of political and technical expertise.

Convergences and divergences between political and administrative powers have characterized the ways democratic states have designed and performed public actions. In summary, while citizens were addressed as mere "beneficiaries" of the state after the Second World War, the shift towards a more customer-oriented conception of citizens from 1980s onwards led to the reconfiguration of public administrations under new like-market values (Osborne and Gaebler 1992). The externalization of public services was fostered through new public-private partnerships between the state and economic agents while both managerialism and political loyalty was promoted for top-level public officials. New forms of "politicization" of the top-level officials, however, questioned key values of neutrality in public administration.

As De Montricher (2008) defines it, politicization concerns the "appropriation of public agencies by a specific political coalition or the strengthening of the top level of an administration to implement the commitments of the electoral campaign." (ibid., 296). Even though several public officials have always been legitimately involved in politics, although stay clear of party politics on occasion, Peters and Pierre (2004) acknowledge the emerging politicization of public officials in two forms. The first is top-down and involves an increased level of control exerted by

governments over bureaucrats, in an attempt to ensure that the behavior of public officials is compatible with the political preferences that exist under new public managerial reforms. The second is bottom-up and regards the spontaneous increase of political activity of public officials.

Bottom-up forms of politicization recall the long-standing debate on the identities of bureaucrats and the multiple relations that they can establish with both policymaking and the political system. Accordingly, the idea that political input should be merely operationalized by public officials through policy implementation is incorrect. Considering policy implementation as not simply "putting policy into action," Hudson and Lowe (2009) argue that bottom-up approaches to policymaking shed light on how political actions are conducted and reciprocally generate new input. The shift from clear-cut definitions of political and policy powers in policymaking, towards the (re)placement of the policy process within the wider realm of political action, has contributed to the reconsidering policy implementers as key contributors of democratic governance.

Increasingly, the coordination with new policy agents has inevitably become the new battleground of policy implementation. The interaction between public officials and the plurality of agents, interests, goals, and strategies invited to influence decision-making, has considerably broadened policy networks. At the end of the 1990s, scholars and international organizations celebrated a new generation of network-based and multilevel governance aimed at empowering emerging policy networks and ensuring higher degrees of transparency and accountability from governments (Rhodes 1996). New types of skill are becoming critical for public officials, namely, social skills, business management, and language skills. Notably, the new public service model proposed by Denhardt and Denhardt (2007) provided a case in point on the need to pass from mere concerns about policy design performance and attainability, towards new skills and forms of interaction among agents "making" policies, including citizens. In contrast with both standard bureaucratic ideals and new managerialist reforms, citizen-centered reforms have become decisive for the deployment of administrative functions (Bryson et al. 2014).

## Who Are the Frontline Bureaucrats?

In the last few decades, different forms of politicization have had different impacts on public officials according to their level in public administrations. Beyond visions of top-level officials as "long-hands" of political directives, or lower level officials as mere "executors," contemporary democratic governance requires empirical knowledge on the distribution of power within public administration. Most frequently, civil service is structured in administrative units (departments, divisions, etc.) where public officials' roles respond to the hierarchy, comprising top, middle, and lower levels. Public officials at all levels can diversely deploy back-office and frontline functions, although it is more frequent to see public officials at the lower levels of the administrative chain working in the frontline. The creation of extended networks of decision-making and, on occasion, the implementation of policymaking processes with the participation of civil society, corroborates that the fact that top, middle, and street level officials are often mandated to work in both back-office and frontline positions is a key factor (Rhodes 1996).

Policymaking processes that reshape the borders of power of decision-making require public officials to perform frontline functions that scholars have explored by considering a wide range of factors. Focusing on the degrees of administrative accountability in policy implementation has led Lipsky (1980) to identify risks in the use of discretionary powers by "street-level" bureaucrats which will eventually undermine the legitimacy of policy actions. Along the same lines, Hupe and Hill (2007) argue that frontline bureaucrats should be accountable both internally (with political, administrative, and other professional agents) and externally (with social and economic agents) to prevent the uncontrolled use of discretionary powers.

On the contrary, Bovens and Zouridis (2002) advocate that street-level bureaucrats may help

to lessen the effect of bureaucratic impediments so that tailored procedures can be implemented which will, in turn, increase administrative accountability. In this vein, the interaction with lay citizens and the gathering of local knowledge have been seen as strategic for success in policymaking. From a UK-based research, Durose (2009) argues that frontline bureaucrats may hold "entrepreneurial" skills that will allow them to carry out administrative work with marginalized groups of local communities. Civic entrepreneurialism reflects the nature of local governance actions that necessarily represent contested sites for policies, and frontline workers are required to use their local knowledge and know-how to provide public administration with the necessary information for effective service delivery. The variability of policy action in the field means that the imperative for action of frontline bureaucrats is also aimed at accommodating some degrees of disorder in local governance. In the same vein, Lowndes (2005) argues that frontline bureaucrats can be understood as "institutional entrepreneurs," who help improve service delivery in local governance by sharing, borrowing, and remembering daily practices with local communities in the "muddle and mess" of governance. Accordingly, the need for a new "civic enterprise culture" in civil service should originate in the frontline to meet the needs of changing environments.

Despite acknowledging the key role played by frontline bureaucrats in democratic governance, Maynard-Moody and Musheno (2006) found that street-level workers rarely describe themselves as policymakers, decision-makers, or even government workers. By seeing their work as intimately linked to their activities with citizens and other street-level workers, the authors approach them as "citizen agents" (ibid.). These findings corroborate what Denhardt and Denhardt (2007) advocate as the current extension required by public officials in democratic civil service. Accordingly, public officials should help other citizens to negotiate priorities by reducing centralized decision-making. The reframing of frontline functions, in addition, also implies acknowledging that local knowledge is always filtered by frontline bureaucrats' subjective interpretations, requiring adequate tools of analysis and understanding in this field of study.

As Peters and Pierre (2007) state "there is an empirical question about the relative power position of civil servants in reformed administrative arrangements under governance regimes. Also, even if the civil service remains a source of steering and control, we need to remind ourselves that this to some extent is less a control that comes from public office in a narrow sense and more a matter of control that is derived from an ability to coordinate and engage other actors. [. . .] Law and legal controls will to some extent have been de-emphasized so that the discretion of the street level bureaucrat, or the "street level negotiator" will be enhanced" (ibid., 238).

## Frontline Bureaucrats and Beyond

Multiple forms of politicization of public officials and increasing place-based engagement in frontline work should be understood within the reorganization of roles in current public administrations. The extensive use of performance indicators introduced with new public managerial reforms has often contrasted with the fair articulation among public officials, and rather reinforced the separation between top and lower levels (Peters and Pierre 2004; Page 2007). While, in some cases, solidarity within civil service is likely to be downsized by these measures, new forms of recruitment in the public sector has further contributed to transforming the organizational setting of public officials. The plurality of administrative figures that, today, deploy frontline functions has grown exponentially. Frontline bureaucrats, more often than not, collaborate with a new wave of short-term contracted collaborators, experts, as well as temporary employees and agencies assumed by public authorities to deliver public services.

Against this backdrop, an up-to-date approach to the role of frontline bureaucrats is seeking to make sense of the emerging and unclear set of experts and practitioners required to deliver public services via different forms of contract

with public administrations. The recruitment of managers from outside the career system and the use of external agents to implement public policies means that public decision-making is being conducted, on occasion, by people who are not socialized into the career values of the public service. While scholarly debate has dealt with the complex system of public and private experts influencing policy implementation in a wide variety of fields, common is the postpositivist view on current patterns of governance, which have developed new sophisticated mechanisms of networking and raised new questions about the multifaceted definitions of expertise in policymaking.

Frontline bureaucrats are currently required to be the mediators of new collaborative settings, where the creation of new knowledge relies on the participatory dialogue between different forms of expertise, knowledge, and interests. Frontline bureaucrats operate within differing perspectives of public agents because policymaking processes themselves have embraced new modalities of interaction with social and economic agents. The ways through which frontline bureaucrats and workers are deploying functions attached to those described above, or those who are collaborating with private agents that deploy the abovementioned functions, reinforce the need for further research.

## Conclusion

Frontline bureaucrats are the primary implementers and interpreters of public services that can reciprocally feed new policy cycles. The day-to-day contact with social and economic agents allows them to reveal problems arising in the field in connection with public administration. Accordingly, further research should address emerging configurations of frontline bureaucrats in both standard and collaborative settings. Whether frontline bureaucrats rely on either long-career employment in the public administration or short-term contracts should be taken into consideration. Beyond shedding light on the varying combinations of structures, recruitment, and promotion policies, research should contribute to understanding how current frontline strategies substantively work with social agents and relate with governments. In particular, the research needs to look at which strategies are being adopted to engage a wide variety of social agents, some with more expertise in the official political game, and some others who are more concerned with the everyday making of and problem solving linked to concrete policy problems.

The identification of the variable functions deployed by frontline bureaucrats should further provide insights for practical training and help, on occasion, to overcome reluctance in engaging with citizens who lack a specialized knowledge of administrative procedures and to ensure effective advancement of public service. As stated by Cornwall (2001), "Field-level workers whose work often involved telling people what to do, or enforcing rules, were suddenly cast in an entirely different role: for some this unleashed their creativity and energy, transforming their practice. Yet old habits die hard. [. . .] Training courses proved to have other uses: providing new opportunities for horizontal and vertical linkages within institutions and across sectors, bringing managers and bureaucrats into direct contact with the people whom their decisions affect, and giving confidence and voice to lower level workers" (ibid., 46).

# Frontline Bureaucratic Accountability

Kwangseon Hwang
Department of Public Administration, Gachon University, Seongnam, Republic of Korea

## Synonyms

Accountability demands; Managing diverse expectations; Managing diverse task requirements

## Definition

*Accountability* is a social relationship in which an actor feels an obligation to explain and to justify his or her conducts to some significant other.

## Introduction

Coping with accountability has been well developed from the social psychological perspective (Tetlock et al. 1989). Tetlock and his colleagues have found cognitive, emotional, and behavioral strategies of coping with accountability. For example, conformity, preemptive self-criticism (to think in more self-critical, integratively complex ways in which they consider multiple perspectives on the issue and try to anticipate the objections that reasonable), and self-justification are feasible strategies (Tetlock et al. 1989). Facing contradictory demands, people respond to those by decision-evasion tactics, by plunging into controversy and aligning oneself with one or another constituency or by mediating the dispute between the conflicting constituencies.

This chapter is mostly based on the author's article titled "public caseworkers' strategies coping with accountability demands" which was published in the *Journal of Public Affairs* (Hwang and Han 2017).

The chapter explores how street-level bureaucrats manage multiple accountability requirements. Multiple accountability requirements are identified in the child welfare service context (Hwang 2016). Caseworkers acknowledge the importance of coping with diverse accountability requirements, which come into conflict with one another in their daily practice with some variations. So, how do child welfare caseworkers manage or cope with these conflicting accountability requirements? The case in this chapter is *public child welfare caseworkers*, which are relevant to personnel in the areas of adoption, child protective services (CPS), family preservation, and foster care. Child welfare systems are often managed through a steadily expanding regulatory framework that sets forth procedures, timeframes, documentation requirements, and review processes. These management practices encourage caseworkers to look for other careers, and they are contrary to a culture of responsibility and professional growth. Correspondingly, there has been a movement to balance compliance with a regulatory framework and an emphasis on professional commitment (Casey Family Programs 2011).

## Coping with Accountability

A variety of accountability frameworks for understanding accountability and its relationships have been developed (Romzek and Dubnick 1987; Kearns 1994; Koppell 2005). A majority have talked about a conflicting nature of accountability to which managers have to respond. The important implication is not *solving* the tension inherent in the demands to address conflicting expectations but rather *managing* to "fulfill the public's expectations" (Cooper 1996, 604), which provides a more realistic picture of today's organizations and their environments (Acar et al. 2008).

Public child welfare case staffers have been challenged by multiple accountability demands while they accept and decide on the validity of reports of child abuse or neglect (Hwang 2016). They are challenged by the children and families they serve, quality service, themselves, court decisions, supervisors, state policy, coworkers, agency rules, and so on. Local cost of providing services, state legislative oversight and budget, and interest groups all turned out to be less important to caseworkers. The most frequent and important conflicts reported by the child welfare caseworkers were conflicts between policy and practice. Courts, budgets, and administrative procedures might also conflict with caseworkers being held accountable to families and children.

This web of accountability is well represented where a caseworker remarks, "Accountability to my supervisor includes staffing with my supervisor on a regular basis and I report to her information that must be accurate in order to make accurate decisions about children and families. I am accountable to children when I do my job to ensure their safety. I am accountable to families when I am honest about expectations, concerns, and what it is that I do. I have to be accountable for case procedure in that I have to meet certain mandates for entering data. Agency rules would include appropriate conduct and use of company vehicles. State policy would include me meeting state mandates for how many face to face contacts I have with a client and how often." Another interviewee adds, "Regarding budget/local costs, document specific example of why I need services I ask for and how it will help this family or child. In terms of court, write detailed service plans to show the court what progress and barriers each case has to inform their decision for these children." In this complex context of accountability demands, caseworkers' role relies on their accountable relationships. One denotes, "In order to do a good job in this field you have to remember it's all about relationships. Being accountable to supervisors as well as state and federal guidelines is of the utmost importance. Each customer and coworker must be able to see that

you take your job seriously and value each person you serve."

In order to address multiple and competing expectations, bureaucracy has its own discretion with respect to behavior not determined by legislature, which implies "purposive behavior" (Simon 1997, 359). As Simon (1997) describes, purposive behavior indicates deliberate behavior based on actors' knowledge and experience. Bureaucracy has "rational" features such as rules, means, and ends (Weber 1990). Since Weber, there has been an attention toward rational administration (Stinchcombe 1959), which is now defined as professionalization. Mosher's (1982) thoughtful formulation illustrates professionalization like this: "Our dependence upon professionals is now so great that the orientations, value systems, and ethics which they bring to their work and which they enforce on one another are a matter of prime concern to those who would strengthen the democratic system" (p. 12). As the bureaucracy emerged as a policymaking force to tackle complex issues, Friedrich's emphasis on a professional public service has prevailed in most Western democracies (Jackson 2009, 74).

Managing diverse accountability requirements, which is based on the concept of managing expectations, purposive behavior, and professionalization, can be supported by the theory of street-level bureaucracy which argues that discretion motivates the street-level workers. As seen in the changed nature of accountability from solving to managing the tension, how to manage accountability expectations became a crucial part of rational professionalism in bureaucracy. As Friedrich (1940, 10) recognizes, bureaucracy exists to deal with needs identified by political process, and the challenge is to make those functions effective, not to take power away from administrators for fear of bureaucrats making mistakes or doing wrong. Hence, worker's discretion to deal with the accountability demands is expected to help the performance improvement (McDermott 2011).

## Frontline Bureaucrats' Strategies to Manage Accountability

Interview with public child welfare caseworkers in Virginia State provides with us profound understanding of frontline bureaucrats' strategies to manage accountability.

### Following Guidelines

The bottom line that caseworkers should stick to is following guidelines. Without keeping the rule, no other accountability activities can be admitted. The child welfare field entails a dynamic accountability context, which mainly comes from both the laws and policies of the government (federal, state, and local) and stakeholders and citizens. In the design and delivery of child welfare services, local and state governments face mandates to improve service performance from many sources, ranging from federal requirements to court decisions.

Our work is to follow policy and law; without those two things, we have no structure for existence. We are accountable for insuring that policy and laws are followed, so everything we do must be in line with those major areas.

When there is a conflict, what is in the best interest of that child and the child's safety is the standard I use to guide my actions.

Social workers are accountable for their services to the board (clientele, budget, state, agency, community, etc.). Although their direct work is with their clientele, that work is greatly influenced by guidance and policy which hold them accountable to the client as well as the state government, agency, and community.

### Talk and Discussion

Talking, discussing, or consulting with coworkers, supervisors, friends, and regional specialists is a crucial strategy for caseworkers. Supervisor helps caseworkers talk the conflicting issues through and weigh them out so that they can balance accountability requirements. CPS supervisors serve as a critical focal point for the successful performance of agency and caseworker practices that strengthen

families. When they are confusing about the implementation, consulting from regional consultants gives them guidance to make the decisions. One says, "If it is a policy issue, I discuss it with the appropriate regional specialist or program manager, often unsuccessfully. If it is a local issue, I discuss it with the workers/directors and come to some resolution." Caseworkers also find a solution by talking to their close friends or coworkers.

Talking to supervisor is critical since they help caseworkers to identify the positive aspects of the policy, procedure, or directive and to specify the benefits to caseworkers, clients, and the agency, as well as the potential problems that may occur. However, sometimes talking to supervisor can bring out a problem of trust among team workers.

I tried talking to my supervisor and her supervisor but I got nowhere. I was to go and do a home visit on a foster family as a part of their reapproval. The foster mother called saying that she did not want me in her home – that I had offended her when I had been there last. I told my supervisor that if there was any truth to this, why had she waited several years to make this complaint. My supervisor forbid me to go to the home. Another worker was sent. I continue to invite the foster mother to training but have no contact with her and did not sign off on her reapproval form. I felt then and even now that a trust was broken between me and my supervisor on a personal and professional level.

Nevertheless, talking or discussing with supervisors or coworkers is a great way to express frustration which leads to a positive turnaround. Caseworkers communicate not just for gaining some insights for the implantation but also earning a time for a breakthrough after releasing their stress. Increased caseloads, conflicting priorities, and problems gaining judicial acceptance of CPS recommendations, for instance, are just a few of the themes that could be spoken by caseworkers.

### Learning and Gathering Information

Caseworkers need to continue to learn and grow. They may need to learn state law and policy, how to assess risk and safety, or the dynamics of abuse and neglect. Practical knowledge is needed regarding the layout of family homes, the immediate surroundings, and typical activities that occur there to provide a baseline from which to judge potential danger. Caseworkers apply these knowledge and skills to their job. As most caseworkers inevitably make errors and miscalculations, these errors should be viewed as learning experiences rather than as failures.

It depends on the type of conflict, subject matter, and who the conflict is with; however generally my strategy is to gather all of the information that I need (do my homework), schedule a meeting to discuss the issue, review all options/action plans, and develop a plan or solution that everyone can live with.

### Transparency and Honesty

Interviewees have used the strategy of transparency or honesty. The supervisor trusts caseworkers and sees them as dependable and honest, as a positive force in the organization, and compatible with organizational goals. As caseworkers talk to their supervisors to solve the problem when they manage accountability requirements, they need to be transparent about the reports and documentation.

Whatever documentation that you provide needs to be honest and accurate because some cases are not only heard in court, but my job is to ensure the safety of children.

### Professional Judgment and Ethical Code

Child welfare social caseworkers respond to multiple accountabilities using their professional judgments or ethical code they have. As the theory of street-level bureaucracy argues, the caseworkers entail discretion to implement the policy. One foster care interviewee puts it, "I have to live with the choices and decisions I make and I want to ensure that I am doing what I deem in necessary and appropriate in a case." The National Association of Social Workers Code of Ethics also provides guidance regarding the professional

conduct of social workers, including child welfare caseworkers.

Sticking to the facts and professional judgment is the best route in direct contact with individuals, families, and professionals involved in a case.

Interviewees agree that they must hold themselves to the highest standard in order to provide quality care, constant self-reflection, and growth in order to be able to help children and families. Yet, CPS caseworkers should be alert to and avoid any conflict of interest that may interfere with the exercise of professional discretion and impartial judgment.

## Conclusion

Public caseworkers are primarily accountable for ensuring the initial and ongoing safety of children identified as being at low to very high risk of current or future abuse and neglect. Also, they may be held accountable for preserving families. Caseworkers have to manage these conflicting accountability dimensions because they may matter to work performance. The reason that social workers have difficulties in the web of accountability is that they meet with people – children and families – for their safety and well-being. A respondent illustrates that "So many of the regulations are arbitrary and set only because someone at some time felt that a standard must be set to define activities. We deal with people not things and there is no exact science to helping people improve their lives."

This study of managing accountability from a caseworker experience has implications for how practitioners should act in the face of accountability requirements. Although practitioners have known what they should do to achieve better performance, knowledge of accountability has been an area that is rarely acknowledged as important for performance. Moreover, this study will offer implications for managers at the street-level about the importance of frontline bureaucrats' strategies for managing accountability in the social service delivery.

# Functional Classification of National Accounts Systems in Korea

Jeong Seongho
Korea Public Finance Information Service, Seoul, Korea

## Synonyms

Classification of the functions of government; Function-specific expenditure

## Definition

The COFOG is a detailed classification of the functions that general government units seek to achieve through various expenditures.

## Introduction

The COFOG, produced by the Organization for Economic Cooperation and Development (OECD) and published together with three other classifications in the United Nations (UN) is a detailed classification of the functions or socio-economic objectives that general government units seek to achieve through various expenditures. It is one of a family of four classifications referred to as classifications of individual consumption, according to purpose (the Classification of Individual Consumption According to Purpose (COICOP); the Classification of the Purpose of Nonprofit Institutions Serving Households (COPNI); and the Classification of the Outlays of Producers According to Purpose (COPP)).

The South Korean government's Classification of the Functions of Government (COFOG) is grounded in the System of National Accounts (SNA) and Government Finance Statistics (GFS). In Korea, COFOG that is based on GFS only compiles total expenditures neither by divisions nor by groups, while COFOG based on SNA compiles functional expenditures by divisions. This study proposes the use of second-level COFOG data. Because of function-specific expenditure, this classification can contribute to expenditure efficiency. GFS-based classification may be beneficial to South Korea for the purposes of fiscal management and the comparison of government expenditures with other countries. Toward this end, the current budget framework (16 divisions, 69 groups) must be reorganized into a COFOG framework (10 divisions, 69 groups). The first-level COFOG data based on GFS should initially be compiled, and then the second-level COFOG data should be compiled from a long-term perspective.

## COFOG Framework

COFOG describes the classification of outlays according to the functions of general government units. It provides a classification of government expenditures by function that is useful to a wider variety of analytic applications. For example, they can be used to analyze the effectiveness of fiscal expenditures in divisions or groups. All expenditures of a particular function are aggregated into one category of COFOG, regardless of the economic nature of the expenditure. Also, COFOG is used for making international comparisons of the extent to which governments are involved in particular economic and social functions. For particular analyses, COFOG provides key aggregates as indicators (Jeong 2018; IMF 2014: paragraph 6.126~6.132).

As explained in Table 1, the specific classification system of the COFOG is as follows: the COFOG consists of 10 divisions, 69 groups, and 109 classes. The 10 divisions are as follows: general public services; defense; public order and safety; economic affairs; environmental protection; housing and community amenities; health care; recreation, culture, and religion; education; and social protection. These divisions are further broken down into 6–9 subdivisions (69 groups in total, second-level data).

The coverage of COFOG is a general government unit (central government, local government, and Social Security fund). COFOG-compiled standards vary from country to country (see Appendix Table 1). The standard is divided into

GFS-based standards, compiled by the government (primarily the central budget office), and the SNA-based standards, compiled by the Central Bank (e.g., the Bank of Korea). However, the criteria employ the same UN COFOG. Most countries only compile first-level COFOG data (by division) for GFS and SNA standards. On the other hand, EU countries and some other countries compile both first- and second-level COFOG data. EU countries are compiling first- and second-level data (groups) of GFS and SNA standards. In particular, EU countries use second-level COFOG data to compare fiscal expenditures and to monitor the directions of fiscal policy across countries. EU countries established the European Central Bank, agreed on by the Maastricht Treaty (Dec., 1991) and based on the Delors Commission's report, and founded the European Monetary Union as well as introducing the euro as unit of currency in an EU summit in Madrid (Dec., 1995). Also, EU countries provided a manual for using government finance statistics based on standard of unity, through which they monitor the state of finances between countries (Eurostat 2011). In particular, EU countries compare and analyze government expenditures across nations using first- and second-level COFOG data (Eurostat 2014).

In Korea, the GFS-based COFOG (organized by the Ministry of Strategy and Finance) compiles only total expenditures (7), and the SNA-based COFOG (organized by the Bank of Korea) compiles first-level COFOG data (by divisions, 701–710). South Korea did not report GFS-based COFOG data for FY2014. Fortunately, the Korean government reported total expenditure from FY2015. The reason is that South Korea made government financial statements based on the accrual basis from FY2011, but it was concerned about problems with consistency when compiling COFOG data (Jeong 2015, 2017).

## Why?

The COFOG data is composed of first- and second- level data (although there is also third-level data, which is not addressed here). The first-level COFOG data can be used to monitor function-specific expenditures by general government units. However, the second-level COFOG data can monitor the first-level subcategory data in more detail. As mentioned above, EU countries are monitoring fiscal expenditures by using the second-level COFOG data in addition to the first-level COFOG data. That is, second-level COFOG data is utilized as a mechanism for monitoring fiscal conditions between countries (Eurostat 2014).

As mentioned above, the Korean government reports only total expenditures (7) of GFS-based COFOG data and first-level data (701–710) of SNA-based COFOG data. This study proposes first-level COFOG data compilation at the general government unit (GFS standard) and also suggests second-level COFOG data compilation from a long-term perspective (including GFS- and SNA-based COFOG). Let's discuss this further because the argument of the COFOG compilation is directly related to the budget and settlement framework. The current Korean budget framework consists of 16 divisions (69 groups), benchmarking COFOG (14 divisions) on a cash basis GFSM 1986 (IMF 1986). The budget framework, which comprises 16 divisions, including the budget system and the settlement system, differs from the mid-term expenditure framework (hereafter MTEF) and budget plan (bill), which consist of 12 divisions. Therefore, 12 divisions and 16 divisions do not precisely match, and the total expenditure by function is also inconsistent. South Korea is compiling first-level COFOG data manually based on the budget framework (16 divisions), reporting only total expenditures in the case of IMF. Currently, GFSM 2001 is being used, and GFSM 2014 is in the pipeline.

After experiencing the IMF crisis, Korea pursued fiscal reforms, referred to as the 3 + 1 fiscal reforms (MTEF, top-down budgeting, performance-oriented budgeting, digital budget, and accounting system). These fiscal reforms played a major role in raising the sustainability of public finance. However, due to the lack of linkage between fiscal systems, the expected

effect of fiscal reform has been somewhat halted (Jeong and Kang 2019). In particular, the inadequacy of the linkage between fiscal systems remains an external reform, representing practices that are not significantly different from those of the past. For example, MTEF is low in effectiveness and consistency. Top-down budgeting is not significantly different from the traditional bottom-up approach. Performance-based budgeting has become a means for budget cuts rather than performance evaluations (Jeong and Kang 2019). The MTEF is not compulsory, and top-down budgeting is limited to formal and perfunctory autonomous budgeting by ministries and agencies. Also, the performance-oriented budget is simply employed as a method for cutting exaggerated budget requests (Jeong and Kang 2019).

Furthermore, despite fiscal reforms, the MTEF and the budget plan still utilizes 12 divisions, and the budget and settlement framework utilizes 16 divisions. Because the existing budget framework is utilized, 16 divisions are valid. The mismatch of the budget framework limits the expenditure ceiling, which is the basis of sustainable fiscal management: that is, the amount of departmental expenditures. In particular, the link between the MTEF and the top-down budgeting system is limited. Recently, the government has employed a spending review mechanism to allocate the budget. However, it is doubtful whether expenditure efficiencies such as spending reviews are possible under the current budget system. This is because the current budget framework doesn't allow for spending review. The performance-based budget has likewise been criticized for its lack of performance. More specifically, the performance report based on the performance goal management system (hereafter PGMS) has been criticized as a soulless financial statement (Jeong 2017; Jeong and Kang 2019). The priority in budget plans (bill) and MTEF should not be changed in a broader view, although it is just a rolling plan. MTEF should not remain as a map plan because it is a foundation of fiscal operations.

Fortunately, beginning in 2018, the government abolished meta-valuation and introduced core program assessments to strengthen autonomy and accountability in line ministries. The introduction of core program assessments may contribute to a certain degree of soundness. However, the effects cannot be realized unless they address the linkage constraints between the fiscal systems discussed so far. This study suggests the use of the COFOG system (first- and second-level COFOG data) from an alternative viewpoint. This is because the COFOG system is a suitable solution to the problem of linkage between fiscal systems (e.g., MTEF, top-down budgeting, performance-based budgeting), and as a coordinator of the segmental (structural) problems with the budget system and the settlement system. In addition to this, the linkage between digital budget and the accounting system (hereafter DBAS, sometimes called the "digital Brain" or "dBrain"), which was established for supporting fiscal reform, and the linkage between fiscal reform and DBAS is essential. The DBAS should not be used just as a means for expanding the budget.

## What and How?

The basic structure of COFOG is expenditure by function, not by department. The Korean government must establish the following agenda. First, the government should set expenditure ceilings for each function (beyond the department) and set departmental expenditure limits (hereafter DELs) for each department at their current status. The order should clarify the total expenditures of the MTEF, and it should then establish the functional limits and the DELs in the budget process. It is necessary to break away from the existing exclusive department-oriented budgeting system. In addition, the budgeting system should be changed to the functional expenditure structure, which should then be employed as basic data for spending reviews and linked with performance management. Further, it should be embodied in an integrated financial management information system (IFMIS) that supports these systems. The argument for supporting this is based upon the reform of the budgeting framework (16 divisions)

to be consistent with the COFOG framework (10 divisions).

1. Linking Functional Expenditure Limits with DELs

   The Korean government sets a DELs based on MTEF and top-down budgeting. The line ministry is budgeted based on the DELs. The DELs are limited to monitoring similar duplications of spending by function. Therefore, the budget allocation should keep the DELs consistent, and the budget authority should set an expenditure ceiling for each function. However, the current budget framework doesn't coincide precisely (12 divisions in the budget plan (bill) and 16 divisions in the budget system). Firstly, it is necessary to harmonize the field of financial expenditures (divisions) (Jeong 2018).
2. Linking Spending Review with Strategic Review, etc.

   A spending review (including a strategic review) is possible only if the spending structure by function is clear. As previously explained, the divisions of the budget bill are limited due to the inconsistency between the divisions of the budget and the settlement framework. Even if the spending review is completed, it is only a budget allocation between functions in a large budget framework. In other words, it cannot be clarified to what degree the efficiency of expenditures through spending review is due to the inconsistency in the budget framework. It is important to clarify function-specific expenditure limits while maintaining the DELs. The expenditure limits for each function can be monitored for duplication, overlap, and fragmentation, whereas DELs represent an impossible structure that cannot be accurately monitored. In other words, it is necessary to clarify the expenditure ceiling set by function in order to make a spending review.
3. Linking Performance Management

   The Korean government has been pursuing performance management through introducing a performance-oriented budget system. In particular, line ministries should report performance plans and reports based on the PGMS. The government has introduced self-assessment (self-assessment, meta-evaluation) of the financial program and has benchmarked the US Program Assessment Rating Tool (PART) and conducted an in-depth evaluation (Jeong and Kang 2019). Since 2018, it has introduced a core program assessment (abolishing meta-evaluation) to strengthen the autonomy and accountability of line ministries. Performance management presupposes feedback regarding the budget based on financial statements. Current performance management is problematic due to limitations in the budget and settlement framework (16 divisions) and the budget formulation (12 divisions), although there are problems related to feedback between the budget and settlement systems (69 groups in 16 divisions). In other words, there is a constraint on the linkage between the budget and the settlement systems, but the problem is managed separately from the fiscal mechanism and the budget system, as well as the MTEF. Therefore, the feedback about the budget based on the performance evaluation should be linked to function-specific expenditure limits, the DELs, and the MTEF.
4. Linking the Integrated Financial Management Information System (IFMIS)

   Korea's IFMIS is a DBAS. The DBAS was built with the purpose of supporting fiscal reform. It is globally renowned for winning the 2013 UN Public Service Awards. However, it is necessary to seriously consider whether it is systematically linked to the changed fiscal system. Building an IFMIS does not guarantee accountability or transparency. Fiscal systems and the IFMIS should be recognized as one process and should operate in conjunction with one another. Therefore, it is necessary to support new fiscal reforms (including existing fiscal systems), and it is also necessary to utilize various forms of logic to accomplish this.

In the current DBAS, the budget and settlement framework logic operates relatively well, but it is somewhat limited in terms of working in conjunction with the fiscal system in a large framework.

## Expectation of the COFOG

Sustainable fiscal management is a prerequisite as long as the state continues. Most countries are using the DELs and the function-specific expenditure limits for soundness. Functional expenditure management alternatives include function-specific expenditure classification (COFOG). Therefore, the Korean government must explore various alternatives from the viewpoint of functional expenditure management. The expected effects of utilizing the COFOG framework are as follows. First, it is possible to manage spending by function as well as DELs. Functional expenditure management can be monitored for duplication, overlap, fragmentation, and inefficient management expenditures in the government unit. Second, it can effectively support a spending review as well as a strategic review. Currently, spending reviews are limited in the form of spending structure by department, and it is more suitable for a spending review in a functional classified COFOG. Third, it can be applied to the management of fiscal soundness based on functional expenditures. Functional expenditures by general government units can be used for comparative analysis of soundness between countries. Fourth, it is easy to compile government finance statistics. The Korean government involves additional costs (due to manual work) in compiling the COFOG. Fifth, efficient financial management is possible through the linkage of IFMIS with all budget processes (e.g., life-cycle management). In particular, budgetary processes, budgets, and settlement systems as well as government finance statistics should be fully linked in the IFMIS (Jeong and Oh 2019).

## Conclusion

This study explores assuming the utilization of the COFOG. First, it supports the utilization of divisions and groups of the COFOG (see Table 1). We recommend that first-level data be initially utilized, and that second-level data be utilized from a long-term perspective. This is meaningful because it allows for the accurate monitoring of function-specific expenditures of the general government. It is necessary to reform the government budgeting framework to an international standard (COFOG). In addition, this study supports the concept of connecting the budget and settlement framework. These changes can achieve the expected effects when linked with functional spending management, expenditure reviews (including spending reviews), performance management, and the IFMIS. The use of the COFOG framework for sustainable fiscal management should take precedence over anything else.

## Fund Accounting

Aldo Pavan and Paola Paglietti
Department of Economics and Business Administration, University of Cagliari, Cagliari, Italy

### Synonyms

Besta's accounting theory; GASB's standards; Nonbusiness accounting

### Definition

Fund accounting is a practice that shows preliminary and final accounts of a single organization divided into diverse self-balancing accounts systems related to various activities or organizational units.

### Introduction

Fund accounting is an almost universal practice, particularly used in the public sector of Anglo-Saxon countries. It shows preliminary and final accounts of a single organization divided into diverse self-balancing accounts systems related to various activities or organizational units. The fund concept had been in use in Italy for centuries, particularly in nonbusiness organizations, as revealed by the early authors Angelo Pietra (1550–1590), Lodovico Flori (1579–1647), and Fabio Besta (1845–1922). According to them, the fund can express the entire or partial wealth of an organization, and this is anyhow the subject of a single set of accounts; thus, we have as many sets of accounts needed as there are. With reference to his time, Besta asserts that accounting in modern states is based on the principles of the money custody separation from the power of disposal, as well as the unity of the treasure; the second then gave rise to the uniqueness of the budget and final accounts. The fund accounting practice is then considered to be outdated; it should perhaps be taken into consideration as being more effective in preventing the natural growth of spending. According to Anthony (1980), until the 1920s, nonbusiness accounting was approximately the same as business accounting. In the 1920s, nonbusiness organizations became enamored of the fund accounting practice, and this led to the schism that has subsequently stated. Within approximately 40 years, the considered practice seems to have moved from one country to another. The analysis of contemporary accounting practice benefits from the comparison with the early Italian one. As a matter of fact, fund accounting aim and scope seem to have evolved from the second case to the first in line with the environment's complexity (Pavan et al. 2017).

### Fund Accounting in US GAAP for Governments

The fund accounting practice is founded on the belief that the enactment of only one accounting system is inadequate when dealing with very large organizations, such as central states. The establishment of specific funds can be free or required by law. In the second case, reporting entities with independent accounting systems are defined in terms of identified information needs. It follows that any organization may establish a variable number of funds on the basis of the information considered to be of use; consequently, the whole administration is divided into corresponding self-balancing sets of accounts. Referring to the United Kingdom, Jones and Pendlebury (2000) present a local authority whose accounting system is divided into a general fund, a municipal housing fund, and a fund for the trust management of bequests and donations. The general fund is

related to wide-ranging operations and to everything that does not fit into other funds. Every fund has its assets and liabilities, as well as its operating income and expenses. Revenues pertaining to the general fund come from taxation and governmental assignments without specific purpose, the housing ones from rents and specific grants. A transfer from the general to the housing fund, for instance, is a burden for the former and a gain for the latter. A fund can be related to an organizational unit or to a wealth finalized to a specific intent.

The fund accounting technique shows an unprecedented development in the USA; its theoretical basis is deep-rooted in the thought of William Joseph Vatter (1947). The fund concept includes the segregation of assets for given purposes, the operations, and the service potentials that pertain to those assets. The emphasis of establishing funds is upon the definition of areas of operation, not upon the legal personality. Two reasons are given in support of fund accounting: the inadequacy of business principles for nonprofit organizations and the need to ensure compliance to restrictions that characterize the public sector administration. This technique was considered by its critics to be a useful tool for internal control purposes, but unable to provide a general overview of the financial position (Anthony 1980). Accounting standards for the US public sector are currently issued by the Governmental Standard Board, GASB, which is continuing the work of the previous National Council on Governmental Accounting, NCGA. The first collection of accounting principles for municipalities was published in 1934. The Generally Accepted Accounting Principles (GAAP) for Governments are addressed to states and local governments, various public authorities, and so on. Although not directly applicable, they also form the foundation on which standards for the federal level are defined (Tierney et al. 2007).

The Concept Statement 1, Objectives of Financial Reporting (GASBCS 1), issued by the GASB in 1987, deals with public environment features, public report users, and purposes. Public environment is characterized by electoral representation, so that the government has its ultimate foundation in the citizenry choice. The relationships between the services rendered and their financing are unfamiliar for those who usually deal with business enterprises, in that the former are based on taxation and are not directly related to the second. In the political process, citizens would like to maximize the received services and minimize tax levying. These conflicts are handled by politicians whose relatively short terms in public office encourage the use of short-term solutions to long-term problems. In particular, they have an interest in providing services immediately and postponing or deferring payment of any expenses incurred. For this reason, it is appropriate that the accounts show clearly whether the running costs are funded with nonrecurring income or long-term debt. In this context, the use of fund accounting, mandated by law or voluntary, is grounded in the need to control the use of resources and to inform the users of financial statements.

The GASBCS 1 identifies three groups of users of financial statements: (1) the citizenry – who are at the same time taxpayers, voters, and service recipients – media, advocacy groups, and public finance researchers; (2) members of elected assemblies, officials of the executive, and oversight bodies; and (3) investors, lenders, rating agencies, and financial institutions. The role of citizens and elected assemblies is obviously very peculiar when we compare the public with the business environment; this has relevant implications with the reporting process that is heavily affected by the needs of the users. Due to the peculiar relationships between public organizations and the citizenry, financial reporting in the public sector is heavily characterized by the accountability and interperiod equity concepts. The former is strictly related to the right to information that citizens have as voters and taxpayers; it is the leading tool towards efficient and effective operations. The GASBCS 1 describes accountability as the cornerstone of all reporting government activities which have to justify the use of resources. The second indicates that the current generation of citizens should not be able to shift the burden of paying for current-year services to future-year tax-payers. Yet the particular relationship with the public requires that the information

provided by the statements be easily understandable and useful.

The GASB Statement 14 is entitled "The financial reporting entity" (1991). The starting point to identify those that have to give an account is the legal entity. State and local governments exist by themselves, but very often they establish autonomous business units with which they have relationships not necessarily based on shareholding. This makes it clear that the fundamental concept is accountability: the elected officials are accountable to citizens for operations carried out by the government and the connected component units. The report users should be able to distinguish between the results of the two. The financial reporting entity consists of (a) the primary government, (b) organizations for which the primary government is financially accountable, and (c) other organizations for which the nature and significance of their relationship with the primary government are such that exclusion would cause the reporting entity's financial statements to be misleading or incomplete (Ruppel 2013).

The definition of fund accounting dates back to the NGCA Statement 1. A fund is defined as a fiscal and accounting entity with a self-balancing set of accounts recording cash and other financial resources, together with all related liabilities and residual equities or balances, and changes therein, which are segregated for the purpose of carrying on specific activities or attaining certain objectives in accordance with special regulations, restrictions, or limitations.

The fund is therefore a separate accounting entity, which does not express an independent legal organization, but is used only for accounting and reporting. It is the subject of a self-balancing set of accounts, which ends with the final state of the fund – balance sheet – and an account of fund changes – operating statement. The balance sheet does not always present all the usual items typically present in private sector business financial statements. As we will see in more detail later, when dealing with governmental funds we do not find both fixed or capital assets and long-term debts. The difference between assets and liabilities is the fund balance.

Fund accounting implements the wealth segregation according to different wealth purposes, so as to allow better control over the collection and proper use of resources. It is an opinion that in this way it is possible to minimize the risk of overspending and unclear information. According to these principles, in the past different bank accounts were used, but this practice is considered no longer compatible with the complexity of contemporary administration. We have already said that fund accounting can be free or mandatory, according to laws or regulations related to specific resources: organizations can have few or many funds, depending on their information sensitivity or control needs. American public sector organizations have been characterized by huge fragmentation and a lack of overall vision for a long time. Thus, in 1999 the GASB Statement no. 34, GASBS 34, was issued; the fund accounting general approach having been confirmed, it gives an overall picture that is now secured in the government-wide financial statement.

Funds are classified into three major groups: (1) governmental funds, (2) commercial funds, that is, proprietary or business-type funds, and (3) fiduciary funds. Regarding the former, the general fund is unique to each administration as it holds resources for the general business and, as a residual, all those who have no specific destination. Special revenue funds pertain to distinctive purpose resources; very often they come from the federal or state level of government. Proprietary funds relate to publicly owned enterprises or to internal service activities. Fiduciary funds pertain to resources that are administered on behalf of third parties, such as those relating to the social security treatment of employees.

The United States fund accounting is founded on two main recognition criteria: the basis of accounting and the measurement focus. The former refers to when a transaction is detected. The modified accrual basis of accounting is a criterion intermediate between the cash and the accrual ones and is of great relevance for the present analysis. It is peculiar to the governmental activity and its features. Its main characteristic is that revenues are recorded when they are susceptible to accrual, that is, when they are both measurable

and available to face current outflows. The measurement focus concept, connected to the modified accrual basis of accounting, is related to the flow of current financial resources. The balance-sheet of governmental funds typically exposes the currency available in the near future, which means cash, receivables, inventories, prepaid items, payables, deferred revenues for payments received for future tax levying; as we already said, we do not find fixed assets and long-term liabilities. The operating statement discloses variations in every item of the fund; revenues are made up of increases of net-assets available to spend, expenses by decreases. It is noteworthy here that the purchase of a capital asset diminishes currency, while a new long-term debt increases it. Proprietary funds are accounted according to the accrual concept; the measurement focus is on the flow of economic resources. The accrual basis of accounting and the related flow of economic resources are used in the government-wide and business-type financial statements. The modified accrual basis and the related flow of current financial resources are used in governmental funds.

## The Fund Concept and Its Accounting in the Italian Tradition

Fund accounting is particularly used in the USA, the today most powerful state in the world; its setting is politically and economically advanced; public sector organizations are large and complex. American governments have to face domestic pressure for transparency and involvement – accountability – and external pressure, both competitive and military. The available technical tools are made by the most sophisticated telematics technologies. The fund accounting concept was well known and the practice in use in Italy, starting from the Middle Ages and the Renaissance until the beginning of the twentieth century. The economic world was characterized by a slow economic development, small business enterprises, early municipalities, monasteries, and the different administrations of the Italian states. Available technology was elementary and accounting records were kept by hand. Investigating the Italian early practice can shed light on the American present one and help in understanding its motivations and rationale.

The Italian history of accounting is mainly connected with that of the monasteries, located at that time throughout Europe. In fact, if Luca Pacioli (1445–1517) was a Franciscan friar, the major Italian authors of later centuries were also religious: Angelo Pietra a Benedictine and Lodovico Flori a Jesuit. For centuries monasteries were centers of spirituality and culture; they also had to meet the needs of large communities of religious citizens and to manage their vast estates and related agricultural production. Unlike what usually happened in small businesses in the Middle Ages and the Renaissance, where the owner was at once the administrator, Angelo Pietra faces the problem of how to control organizations not based on single or few persons and to give account to superiors. The book *Address of Bursars* – in Italian *Indirizzo degli Economi* (1586) – has an educational aim; in it Pietra describes the kind of Double Book named *Noble Book* – in Italian *Libro Nobile* – only used by those living from their annuities and namely by monasteries. Finally, he also proposes the extension of the described accounting system to a public entity, such as the Duchy of Mantua. Three inventories have to be used; the first is focused on real estate and related herds; the second on movable property and its consignees; the last one on notes, namely, cash, receivables, payables, and goods in stock. Just the inventory of notes is dealt with in the *Noble Book*; in other words, the subject of the double-entry accounting system is the working capital. Conversely, movable and immovable property are not recorded at all in that book.

Lodovico Flori explicitly continues the work of Pietra; similarly to the latter, he turns his attention to the administration of the religious establishments and, more precisely, to the houses and colleges of the Society of Jesus in the Kingdom of Sicily. In his Treaty of how to take the home book with its sample – in Italian *Trattato del modo di tenere il libro doppio domestico col. suo esemplare* (1636) – he states that the overall goal of the accounting practice is to see how our affairs are and to give an account of them. Flori focuses on the noble book whose upkeep is the responsibility of the bursar father. The latter updates the

ledger monthly, drawing on the daily entries from the journal. Following Pietra's example, Flori proposes an incomplete accounting system, whose subject matter is made up only of the working capital, and where the fixed capital is not taken into account.

Besta develops his accounting thinking at the end of the nineteenth century. He spent most of his life in Venice, between his academic chair and the archives of the Most Serene Republic. He studied the early accounting books, as of the end of the fourteenth century, relating to both public and private organizations and investigated their evolution.

Fabio Besta's argument builds on the whole entity concept – or organization, in Italian: *azienda* – that is defined as the sum of phenomena, businesses, or relationships to be managed, connected to an amount of capital that stands alone, or to a single person, or to a family or to any kind of associations, or even only a separate category of those phenomena, businesses, or relationships. With regard to the theory of accounts, an entity is viewed as a wealth to be managed; the self-balancing set of accounts has firstly to disclose the status of this wealth and its variations deriving from operations related both to market exchanges and internal production processes (Besta 1922, vol. I, II).

The fund concept has a historical foundation as the most serious concern of the honest rulers of the public finances, at all times, was to get that the funds were never lacking to pay the costs, which were considered more relevant for the dignity, honor, and the welfare of the state. And it seemed that the best way to achieve this intent was to constrain to each of such payments the funds from certain annuities or taxes; this was achieved by guarding those funds in separate cases (Besta 1880). In the Republic of Venice, each case was assigned to an official; payments were authorized even taking into account the expected revenue for the related funding; specific estimates and final accounts were thus kept. It was observed that the large amount of records and checks that they needed was a source of confusion; thus, the Senate ruled in 1724 to study ways, if possible, of reducing to one the many cases relating to public finances. The resolution was not performed due to the Venetian government's fears of a great accumulation of authority in the hands of a single official.

Besta defines the fund as a complex subject of a system of accounts. In fact, there are many accounting systems; in each of them its complex subject can be regarded as a fund, in its general meaning. When the fund is the whole wealth of the entity, he speaks about a comprehensive set of accounts; when the fund is a part of that wealth, the set of accounts is incomplete. Such a fund can always be viewed as being made up by elements, one or more, that can be just assets or just liabilities or partially assets and partially liabilities (Besta 1922, vol. II).

As an entity is a sum of phenomena, but also solely a separate category of those phenomena, its wealth can be regarded as a whole or in its parts. The fund is thus defined as the set of items of the whole wealth of the organization or of a part of it. The modern reader could be surprised when considering that the author continues by asserting that entities that do not have comprehensive accounting systems are much more numerous. In this case, it is possible to talk about incomplete or partial equity systems that can have a diverse nature and extent. An entity can have just one of them or several at the same time. In general terms, the subject of the set of accounts is the whole wealth; when the organization runs a few incomplete systems, the whole capital fund has to be split up into many segregated funds. This action is framed by the author in a broader technique called differentiation of the accounting systems, by which a complex system is divided into two or more having a lesser extent. In this way, it is possible to have a better understanding of the changing of wealth as a management base. Differentiation of accounting systems means to divide a complex system into two or more of a lesser extent; such a division is advisable whenever the fund can be divided into two or more funds, each of which has a separate operation, and it is opined that the segregation of the sets of accounts can give to management faster and more reliable information on each fund and related operation. Differentiation of accounting systems is very common when the central state, large municipalities, the greatest public bodies, and

some big private enterprises establish new distinct businesses or autonomous enterprises that utilize separate sets of accounts. An interesting class of incomplete accounting records ignores the fixed asset value, for example, farms and homes; it opens accounts just for money or even stocks, receivables, and payables. Examples of this type, related to the so-called changeable or working capital, are proposed by Besta explicitly working on previous accounting theories by Pietra and Flori. While it is always possible to decompose a given self-balancing set of accounts into two or more smaller systems also self-balancing, it is also possible to put in place the reverse, called integration. In fact, one could consider it appropriate to merge two or more incomplete sets of accounts that are similar into just one.

## Conclusion

The Italian early tradition helps in explaining the present American fund accounting practice. The first has developed over a period of about four centuries, from the late fifteenth to the late 1800s. GAAP for Governments has continued to evolve and to be implemented. The identified concepts and techniques are so close as to be considered variants of the same idea; they can be considered as part of an evolutionary perspective. Similarities in conceptual categories coexist with very dissimilar environmental features. The economy of the fifteenth to the early twentieth centuries is characterized by slow development; public and nonbusiness entities are small in size and operate simple economic activities; accounting is oriented towards internal control and accountability to superiors. The highly developed US society requires information and transparency; fund accounting advances for both internal control and external, democratic, accountability purposes. In Italian tradition, fund accounting is useful for management and control purposes, in GAAP standards also, and maybe especially, for reasons related to accountability towards citizens. We can say that in both the US and Italian cases, the ideas and techniques specifically under consideration are very similar but do not overlap.

Primarily the definitions and scope of the "organization" and of the "reporting entity" are analogous but not identical. And yet, in both cases, a need for an entity emerge, to which it is possible to relate a wealth, a set of operations, a management, and reporting activity. Besta's notion of a "changeable" fund is of special interest: the subject of the set of accounts is what we now call the "net working capital"; this concept was already presented in the sixteenth and seventeenth century by Pietra and Flori. Reasonably, control needs in monasteries were not connected with properties and other fixed assets, while they did not make use of long-term liabilities. Looking at US governmental activities, only the changeable part of the wealth is focused on; in business activities, all the entity's wealth is under observation. GAAP for Governments deal particularly with the recognition of revenues deriving from tax levying. This is a very peculiar topic, unknown in the business world and not dealt with by the Italian authors. GASB's standards define later the "measurement focus" concept and apply it to the "accrual" and "modified accrual" environments. The dynamic notions of economic resources flow, in the first case, and flow of current financial resources in the second, can be related to those of complete and changeable funds and their variations. Despite the significant difference in the recognition of revenues, the North American relationships between assets and liabilities of the current period seem to be very similar in its own essence to the changeable fund described by Besta as typical of the previous Italian accounting tradition.

In light of the above observation, the fund accounting practices of the Italian tradition and the contemporary US public sector ones show surprising similarities. They may have been formed in a completely unconnected way, in response to similar needs to curb the increase in spending and to protect the entity's wealth. In the US case, concepts and techniques have evolved, according to different environment features. We cannot even exclude, however, that there could have been a historical continuity between the early Italian and the present North American practices. Bearing in mind that double-entry

bookkeeping originated primarily in Italy and later spread all over the world, a historical relationship could have been occurring mainly through the accounting routine, but also via the international circulation of the works by Pietra, Flori, and Besta, or their summaries and other works in different languages which got lost.

## Synonyms

Administration – management; Legislation – act, law, statute; Rule – regulation

## Definition

Administrative law: A body of law pertaining to powers and controls on powers that may be exercised by public agencies.
Administrative state: A term referring generally to the aggregation of all public agencies.
De novo: A Latin term meaning "from the beginning" or "anew."
Public administration: All processes, organizations, and individuals acting in official positions to carry out laws or other rules adopted or issued by legislative bodies, executives or the courts.
Public agency: Any department, bureau, office, authority, board, commission or other similar body in the executive branch of government.
Red states: A popular term referring to those American states which are dominated, politically, by Republican voters.
Ultra vires: A Latin term meaning "beyond the power."

## Introduction

The growth of the practice of public administration in the United States has been nurtured by the enactment of many new government regulations and the creation of a massive administrative state to enforce them. Administrative law seeks to define the powers, limitations, and procedures of public administrators and government agencies. Currently, the emergence and importance of administrative law can best be understood as a political and judicial response to widespread public concerns about the enlarged power and pervasiveness of the modern administrative state and, in particular, the regulatory reach of many (federal and state) government agencies. As such, government regulation, public administration, and administrative law are inextricably interrelated.

In the foreseeable future, compelling political pressures may result in more government regulations (in such contentious areas as immigration policy, energy sufficiency, climate change, financial industry regulation, gun control, or environmental protection, just to name a few) and therefore a consequential expansion of the

administrative state. However, at the same time, conflicting political pressures for more restraint on regulatory policies and procedures may trigger important new developments in administrative law.

## Public Administration and Regulation

The term administrative agency refers to any government department, bureau, office, authority, board, or commission (Milakovich and Gordon 2013). Typically, enabling legislation creates the agency, specifies its jurisdiction, and authorizes it to promulgate rules and regulations that have the same force and effect as statutory laws (Cann 2006).

Some enabling statutes are very detailed, thus leaving the agency little latitude for regulatory discretion. However, others simply set forth the general policy that congress wants implemented, and the agency is given omnibus power to fill in the details with administrative rules. For example, the Occupational Safety and Health Act of 1970 (Public Law (PL) 91-596) delegated broad authority to the Secretary of Labor to "adopt or use" standards "reasonably necessary or appropriate to provide safe or healthful employment and places of employment," which standards most adequately assure, "to the extent feasible, on the basis of the best available evidence, that no employee will suffer material impairment of health or functional capacity. . . ." (Sections 3(8) and 6(b)(5)). Furthermore, the act created a new government agency in the Department of Labor, the Occupational Safety and Health Administration (OSHA), to implement and enforce federal workplace safety and health standards. In sum, enabling legislation for OSHA is about 17 pages long, and yet, given this statutory authority, OSHA has produced nearly 1700 pages of enforceable rules, regulations, and safety standards. In recent years some of the most contentious cases in administrative law are rooted in fundamental legal questions about proper interpretation of enabling statutes and the permissible scope of delegated legislative authority to regulatory agencies such as OSHA.

Congress and most state and local legislatures too have found it difficult to write all the varied and detailed provisions that are needed to govern an increasingly dynamic, technical, and complex society. Indeed most legislatures lack the time and technical expertise required to establish detailed rules and regulations in a large number of highly complex subjects, such as monetary policy, air safety, nuclear energy, and exploration, transmission, and marketing of oil and natural gas. As these and other areas of public policy became more important – especially in crisis situations – it has become increasingly necessary to create regulatory agencies that are able to competently deal with them. Moreover, even if legislatures had the time and skills, a large, collective decision-making body typically lacks the flexibility needed to adjust existing rules and regulations to changing conditions, again justifying creation of other administrative entities to concentrate on each area (Milakovich and Gordon 2013, p. 463).

For many years the enactment of extensive federal regulations was stymied by conservative lawmakers and strict constructionist justices on the US Supreme Court who broadly construed the Tenth Amendment as a limitation on the exercise of congressional power in matters dealing with both federal and state commerce (Kommers et al. 2010). However, starting with the New Deal in the mid-1930s, a new Supreme Court majority more broadly interpreted the Commerce Clause (Art. I, Sec. 8, Cl. 3) and the Elastic Clause (Art. 1, Sec. 3, Cl. 18), thereby sanctioning the enactment of scores of regulatory statutes by congress and the creation of dozens of new federal government agencies to implement them. Consequently, the national government now asserts primary responsibility for both controlling and promoting economic activity. Although the states are still primary regulators of a few industries such as insurance and secondary regulators of some other industries such as banking, Washington is now permanently entrenched as the center of most major regulatory activity in the United States. Indeed, administrative authority for most major regulatory programs now rests with the federal government.

Today, government regulations – and the agencies that implement them – touch almost every person and business in America in many different ways. Moreover, in the modern era, regulatory agencies do much more than merely execute the law through the usual processes of administration, investigation, and enforcement. Typically, they also make the law through the exercise of delegated legislative authority. In fact, in any given year, many more federal laws are created by government agencies in the form of rules and regulations than are formally enacted by congress as federal statutes (Hall 2015, p. 182; Kerwin 1999, p. 91). Likewise, in the modern era, government agencies also interpret the law. Federal courts, including the Supreme Court, accord great deference to agency interpretations of relevant federal statutes (Schwartz 1991, §10.34). And final agency orders from adjudications conducted by administrative law judges (who are not part of the judicial branch of government under Article III of the US Constitution) have the same legal effect as final judgments entered in federal district courts, because they are not typically subject to de novo review. Pursuant to Title IV, *Federal Rules of Appellate Procedure*, final agency orders, much like final judgments in district courts, receive judicial review in the US circuit courts of appeal. Moreover, by statute congress may specifically preclude judicial review of agency adjudications (5 USC §701). Today there are more than 1400 federal administrative law judges who hear cases in federal agencies – more than double the number of federal judges who preside over civil and criminal cases in federal district courts. "Certainly, the modern proliferation of administrative agencies has severely strained the Framers' pristine notion of separation of powers" *Federal Trade Commission* (*FTC*) *v. American Natl. Cellular*, 810 F.2d 1511, 1516 (ninth cir. 1987), cited in Schwartz (1991), p. 9.

Given the convergence of executive, legislative, and judicial powers in regulatory agencies and in response to growing concerns about the pervasiveness of government regulations, one can presage some new developments in public administration and administrative law to further militate against abuse (or at least the perception or potential for abuse) in the executive branch of government.

## Public Administration and Law

Administrative law governs the legal authority of administrators to control private rights and obligations of corporations, government, and individuals (Hall 2015, p. 2). It limits not only the scope of authority but also the manner in which that authority is exercised. All public administrators are governed in their operations by this body of law, as well as by legislative and chief executive directives, but administrative law is particularly significant in the regulatory process because the latter bears directly on private rights and obligations. Viewing the relationship between regulation and administrative law another way, regulation involves certain kinds of constraints that government places on private citizens, groups, and institutions, whereas administrative law is concerned with the constraints government places on itself.

Prior to 1936, there was no official source for information about federal contracts, grants-in-aid, administrative rules, or regulations, and administrators were free to make whatever decisions they choose, without accountability to congress or the American people. This caused a great deal of confusion as well as limiting access to small number of "connected" procurement contractors. In the famous "Hot Oil" case, *Panama Refining Co. v. Ryan*, 293 US 388 (1935), delegation of power to the president under Section 9(c) of the National Industrial Recovery Act, went all the way to the Supreme Court before the attorney general realized the case was based on a regulation that was no longer valid. To prevent another embarrassing mishap, congress passed a law authorizing the publication of the *Federal Register* (PL 74–220). Before adopting a rule, an agency generally must publish advance notice in the daily publication. This practice gives those who have an interest in, or are affected by, a proposed rule the opportunity to participate in the decision-making by submitting written data or by offering views or arguments in writing

(and sometimes also orally at a formal "on the record" hearing). Before a rule is adopted in its final form and 30 days before its effective date, the agency must publish it in the *Federal Register*. Formally adopted rules are published in the *Code of Federal Regulations* (CFR) that the government publishes each year so that rules are readily available to the public.

Congressional concern about the growing power of the administrative state led to enactment of the federal Administrative Procedure Act in 1946 (Hall 2015, p. 2). The act manifested political concerns and legislative compromises over administrative practices and procedures of the so-called fourth branch of government and especially with regard to agencies (in the executive branch) that are authorized to exercise quasi-legislative and quasi-judicial powers in the implementation of an ever-increasing array of government regulations (Shepherd 1996).

Today, the four main sources of federal administrative law are (1) relevant principles and provisions of the US constitution, as interpreted by the Supreme Court; (2) enabling statutes which organize, empower, and delimit the jurisdiction of government agencies; (3) executive orders, presidential memoranda, and other executive actions affecting government agencies; and (4) the Administrative Procedure Act which governs rulemaking and adjudication (and certain other requirements) in covered agencies. Future developments in each of these four major sources of administrative law will likely reflect growing concerns about the size of scope of the administrative state and the extent of bureaucratic power.

## Separation of Powers and the Nondelegation Doctrine

The nondelegation doctrine is a corollary of the separation of powers doctrine. It is a cornerstone principle in administrative law, because executive branch agencies have no inherent authority to exercise quasi-legislative power. As such, the viability of federal agency rules and regulations depends on both a constitutional source of power for congress to enact the overarching federal statute and also a constitutional grant of authority from congress to an executive branch agency (or official) to promulgate administrative rules, regulations, or executive orders in furtherance of the statute (Hall 2015, ch. 5; Sunstein 2000).

In the early 1930s, the conservative majority of Supreme Court justices, relying on a narrow interpretation of Commerce Clause coupled with increased emphasis on the Tenth Amendment as a limitation on congressional power, or a broad interpretation of the nondelegation doctrine, or both, managed (for a while) to interpose constitutional barriers to an impending expansion of federal government policies and programs in the aftermath of the Great Depression. *Panama Refining Co. v. Ryan*, 293 US 388 (1935) (the "Hot Oil" case); *A.L.A. Schechter Poultry Corp. v. United States*, 295 US 495 (1935) (the "Sick Chicken" case); *Carter v. Carter Coal Co*., 298 US 238 (1936). Simply stated, the Supreme Court adhered to a somewhat narrow view of congressional power under the constitution, which limited the size and scope of the American administrative state.

However, beginning in 1937, a new (5-4) majority on the Supreme Court adopted a more liberal interpretation of the Commerce Clause to uphold the constitutionality of legislation creating and empowering a new federal agency. *National Labor Relations Board* (*NLRB) v. Jones & Laughlin Steel Corp*., 301 US 1 (1937). Likewise, the Court soon returned to a traditional, and less effectual, interpretation of the nondelegation doctrine. For example, in *Yakus v. United States*, 321 US 414, 420 (1944), the Court upheld a provision of the Emergency Price Control Act that directed the Federal Price Administrator to fix prices that "in his judgment will be generally fair and equitable and will effectuate the purposes of this Act." In fact, subsequent to the "Hot Oil" and "Sick Chicken" cases in 1935, the Supreme Court has not invalidated any act of congress based on the nondelegation doctrine – opting instead to give great deference to congressional acts that delegate legislative authority to the president and agencies in the executive branch of government. Provided that congress articulates an "intelligible principle" to govern (and thereby

restrict) executive branch officials and agencies in the exercise of delegated authority, such acts – and agency rules promulgated pursuant to such delegated authority – have consistently been upheld as constitutional.

From 1937 to the mid-1990s, the Supreme Court adhered to a broad view of congressional power pursuant to the Commerce Clause and a limited view of the nondelegation doctrine. Consequently, during this period, the Court sanctioned the largest expansion of the federal administrative state in American history.

More recently, however, a conservative-minded majority on the Supreme Court began to put the brakes on congressional power pursuant to the Commerce Clause. In the *United States v. Lopez*, 514 US 549 (1995), Chief Justice William Rehnquist, writing for the five-person majority, held that provisions of the Gun-Free School Zones Act of 1990 were unconstitutional. This, then, was the first Supreme Court case since the New Deal to set limits to congress' power under the Commerce Clause. Five years later, in the *United States v. Morrison*, 529 US 598 (2000), the Court held that a critical part of the Violence Against Women Act of 1994 was unconstitutional. Again Chief Justice Rehnquist, a constitutional conservative, delivered the Court's opinion on behalf of the five-person majority which held that congress exceeded its Commerce Clause power.

In a nutshell, during the last two decades, conservative justices of the US Supreme Court have been less willing than their immediate predecessors and certainly much less inclined than their liberal counterparts on the Court, to extend carte blanche to congressional acts pursuant to the Commerce Clause. Moreover, a few (albeit not all) of the Supreme Court's constitutional conservatives have also shown some interest in reinvigorating the nondelegation doctrine.

For example, in *Industrial Union Department, AFL-CIO v. American Petroleum Institute*, 448 US 607 (1980), the Supreme Court, in a 5-4 decision, upheld a challenge by the petroleum industry against a new OSHA regulation setting standards for benzene in the workplace. Justice Rehnquist concurred with the Court's judgment that a new OSHA regulation was invalid. However, his opinion was based on a completely different line of reasoning than that expressed by the other four members of the majority. He considered the Occupational Safety and Health Act to be unconstitutional in part because it violated separation of powers by delegating legislative policy-making authority to the executive branch without "any guidance" to the Secretary of Labor.

The following year in *American Textile Mfrs. Inst., Inc. v. Donovan*, 452 US 490 (1981), the textile industry sought to invalidate a new OSHA standard limiting occupational exposure to cotton dust. Although the Court upheld the OSHA regulation, Justice Rehnquist, joined by Chief Justice Warren Burger, wrote a noteworthy dissent, which begins as follows: "A year ago I stated my belief that Congress in enacting 6(b)(5) of the Occupational Safety and Health Act of 1970 unconstitutionally delegated to the Executive Branch the authority to make the 'hard policy choices' properly the task of the legislature.... Because I continue to believe that the Act exceeds Congress' power to delegate legislative authority to nonelected officials,. . .I dissent." 452 US 490, 543. Simply stated, Justice Rehnquist argued that the insertion into Section 6(b)(5) of the words "to the extent feasible" rendered what had been a clear, if somewhat unrealistic, statute into one so vague as to be an unconstitutional nondelegation of legislative authority to the executive branch. The attempted delegation was plainly void because the power sought to be delegated was legislative power, but nowhere in the statute did congress declare or indicate any policy or standard to guide or limit the agency when acting under the delegation.

Moreover, it is noteworthy that several state Supreme Courts routinely invoke the nondelegation doctrine under state constitutional law to invalidate the delegation of legislative authority to the executive branch, absent-specific statutory standards to constrain the exercise of delegated authority by state government agencies (Rossi 1999).

In recent decades the conservative majority on the Supreme Court has revived the Tenth Amendment as a limit to congressional power pursuant to

the Commerce Clause. Perhaps, then, in the next few decades, if future presidents continue to stack the Supreme Court with justices committed to "original intent" and "limited government," the Court may also breathe new life into the moribund nondelegation doctrine. If and when this happens it will constitute a major development in administrative law. See generally, Schoenbrod (1985).

## Enabling Legislation and Ultra Vires Acts

Every federal agency is a creature of law, meaning that an agency's power to make enforceable rules and regulations – and conduct binding adjudications – must be authorized by congress. Consequently, enabling legislation constitutes a foundational source of administrative law (Cann 2006, p. 14; Hall 2015, p. 115). *Ultra vires* is a Latin phrase meaning "beyond the powers." When a federal agency (or agency head) acts without authority delegated by congress in enabling legislation, such acts are deemed to be *ultra vires* and as such, invalid (Hall 2015, p. 58; Schwartz 1991, p. 470). A recent example is *Gonzales v. Oregon*, 546 US 243 (2006) wherein the Supreme Court held that the attorney general lacked statutory authority under the Controlled Substances Act to promulgate an interpretative rule barring doctors from using controlled substances to assist terminally ill patients to commit suicide, as allowed by the Oregon Death With Dignity Act.

Enabling legislation constitutes both the source and also the limit of agency authority. A court must give deference to an agency's reasonable interpretation of its enabling legislation when the governing statute is ambiguous with respect to a specific issue. However, "when the intent of congress is clear, that is the end of the matter; for the court, as well as the agency…" *Chevron USA Inc. v. Natural Resources Defense Council, Inc.*, 467 US 837, 842–843 (1984). See also, *Massachusetts v. EPA*, 549 US 497 (2007) (holding that the EPA erred by not adhering to clear congressional intent). Therefore, when agency rules or regulations do little more than restate enabling legislation by enlarging or restricting authority clearly specified by congress, in the future conservative jurists are likely to invalidate these agency actions as *ultra vires*. See generally, *King v. Burwell*, 576 US 135 S.Ct. 2480 (2015), which upheld certain Internal Revenue Service (IRS) regulations implementing the Patient Protection and Affordable Care Act (ACA) over the objections of petitioners and the dissenting opinion of conservative Justice Antonin Scalia, joined by Justices Clarence Thomas and Samuel Alito, who claimed that the regulations were not authorized by a clear reading of the act. This decision cleared further legal obstacles limiting the expansion of the Affordable Care Act (ACA) but also spawned over 50 other lawsuits by conservative groups seeking to restrict the scope of federal agencies implementing the ACA.

## Unilateral Executive Actions

US presidents are increasingly apt to use executive orders, presidential memoranda, signing statements, and other unilateral executive actions to restrict or expand an agency's enforcement of statutory authority granted by congress in enabling legislation.

President Ronald Reagan often used unilateral executive action to achieve public policy objectives (Nelson 1987). For example, in 1988 President Reagan banned abortions at military hospital except in cases of rape or incest or when the mother's life was threatened. In response, one of President Bill Clinton's first acts after taking office in 1993 was to take unilateral executive action to lift the ban, thereby giving servicewomen access to a procedure that had been available to civilians for 20 years (HeraldNet 2004). Likewise, with the stroke of a pen, Democratic President Clinton ended a 5-year ban on fetal tissue research and he cleared the way for FDA approval of RU486 – known as the French "abortion pill" (Tumulty and Cimons 1993). In the aftermath of 9/11, President George W. Bush issued a number of orders giving the National Security Agency license to wiretap US citizens communicating with people overseas, despite the lack of specific statutory authority (CNN 2005).

So too President Barack Obama resorted to unilateral executive actions when his public policy initiatives were stymied by a recalcitrant congress. Most notably these executive actions affected immigration regulations administered by the agency for US Citizenship and Immigration Services in the Department of Homeland Security (Ehrenfreund 2014; USCIS n.d.) and gun control regulations administered by the Bureau of Alcohol, Tobacco, Firearms, and Explosives (ATF) in the Department of Justice (White House 2016).

President Obama's unilateral action to delay or prevent deportation of hundreds of thousands of undocumented aliens met with strong opposition from about two dozen "red states" which immediately filed suit to block enforcement of the president's executive action (American Immigration Council 2015). Likewise, President Obama's executive action to close the so-called gun show loophole on federally required background checks and other gun control measures (in response to an array of mass shootings during Obama's presidency) was met with fervent opposition by Second Amendment advocates who argued that President Obama didn't have the legal authority to instruct the ATF to "reinterpret" gun control legislation passed by congress and also that the president's actions circumvented the federal APA's rulemaking process (Forbes 2013; Lofti 2013).

These issues manifest an innate tension between the legally defensible doctrine of administrative discretion and the countervailing duty of all officials in the executive branch of government, including the president, to "faithfully execute" the law.

In the future the continued reliance by US presidents on unilateral executive actions, taken in the penumbra of constitutional and statutory authority, to redefine the scope, affected agency duties will eventually result in important new administrative law decisions by the US Supreme Court about the scope of executive and administrative power. Likewise, the limits of administrative discretion by government agencies, and especially regulatory agencies, will no doubt continue to be challenged through both the political system and the judicial process. Indeed, the exercise of administrative discretion – which at the highest level is manifested by unilateral executive actions by the US president – will continue to provide a fertile field for the growth of new strands of administrative law.

## Administrative Procedure Acts

In our political system, government reforms pertaining to public administration and administrative law are sometimes enacted in the states, long before they are eventually adopted at the federal level. For example, Florida began its tradition of openness back in 1909 with the passage of the state's Public Records Law (Ch. 119, Florida Statutes). In contrast congress first enacted a precursor to the present Freedom of Information Act in 1966, which was later strengthened and grafted onto the federal APA (5 USC § 552). Likewise, Florida's Government in the Sunshine Law, which requires open public meetings, was enacted in 1967 (Sec. 286.011, Florida Statutes). About a decade later, Congress amended the federal APA to add a federal Government in the Sunshine Act (5 USC § 552b).

Inasmuch as individual states, such as Florida, are veritable laboratories of democracy, perhaps a good way to prognosticate a future APA reform at the federal level (and in other states) is to briefly examine a couple of recent APA innovations in the Sunshine State.

The federal APA requires that agency rules (like federal statutes) be indexed for ease of public access. However, there is no similar requirement for indexing of federal agency orders. In 1974 Florida amended its APA to start requiring state agencies to index final their final agency orders (Shoop 2016). However, for many years most state agencies struggled with implementation. In 1992 the legislature went further by authorizing an electronic database to enable users to research and retrieve full texts of agency orders by means of an ad hoc indexing system employing logical search terms in common usage. Unfortunately, however, this amendment did not resolve agencies' struggles with correctly maintaining subject matter indexes (*Id*). In 2008, the Florida

legislature revisited the issue once again (Ch. 2008-104, Laws of Florida). It authorized agencies to transmit electronic copies of orders to the Department of Administrative Hearings (DOAH) for posting on DOAH's website in a format that uses a Google-driven text search and, more recently, in the 2015 regular legislative session, the Florida Legislature amended the APA again to require all agencies to electronically transmit a certified text-searchable copy of agency final orders rendered after July 1, 2015, to DOAH, so that going forward DOAH's website will be the official subject matter index for agency final orders (Ch. 2015-155, Laws of Florida). Consequently, for the first time in Florida, all agency final orders are required to be indexed and located in one central repository (Sec. 120.536, Florida Statutes). As such, the public will know where they are stored and will have convenient access to all of them (Shoop 2016).

With regard to the rulemaking, in 1996 Florida amended its APA to make it harder for agencies to promulgate and enforce administrative rules and regulations. This action was taken in response to growing concerns by state legislators (and affected interest groups) about the growing pervasiveness of state government regulations and the seemingly unbridled exercise of quasi-legislative power by nonelected officials in state government agencies. Section 120.536, Florida Statutes, now states that a general grant of rulemaking authority is necessary but not sufficient to allow an agency to adopt a rule. A specific law to be implemented is also required. Consequently, even when an administrative agency is broadly endowed with delegated legislative authority, it may not adopt a rule merely because the rule comports with general legislative policy, is reasonably related to the purpose of enabling legislation, and is not arbitrary and capricious. Such a statutory restriction on administrative rulemaking in Florida goes well beyond what is permissible for federal government agencies pursuant to the federal APA and prevailing Supreme Court precedents.

These are but a few of the many examples of how state innovations in administrative law could shape the future direction of public administration and law more widely throughout the country at both the state and federal levels.

## Conclusion

Future developments in public administration and administrative law will arise from the overarching tension between liberals who favor more regulation in areas of heighted public policy concern and conservatives who favor more restraint on regulatory practices and procedures of administrative agencies. Congress may initiate new statutory reforms (perhaps, emulating some APA innovations in the states) to reconcile the competing political points of view. However, in the final analysis, fundamental legal questions about proper interpretation of enabling statutes and the permissible scope of legislative authority delegated to regulatory agencies will hinge on the composition of the US Supreme Court. If the conservative faction retains a majority, the Court may reinvigorate the nondelegation doctrine and further restrict the exercise of regulatory powers by administrative agencies. On the other hand, a more liberal Court majority would likely sanction more regulatory powers and programs and thereby legitimate a further enlargement of the administrative state.

## Game Theory

Javier Núñez
Department of Economics, Faculty of Economics and Business, University of Chile, Santiago, Chile

### Synonyms

Incentives; Strategic Behavior; Strategy

### Introduction

Game Theory is the study of the ways in which *strategic* choices taken by *interacting* agents (or players) promoting their (potentially conflicting) individual preferences or utility lead to outcomes that may or may not serve their individual preferences. Arguably, Game Theory is one of the most significant and widespread theoretical contributions in the Social Sciences since the mid- twentieth century, which has deeply transformed our understanding of a wide array of phenomena in different fields such as Economics, Management, Political Science, Public Policy, Law, and International Relations, and it also has influenced other areas as diverse as Moral Philosophy, Sociology, Social Psychology, and Biology. An example of the large influence and recognition of Game Theory is the long list of Nobel Prize winners in Economics in recent decades awarded for their contributions in this large field (see www.nobelprize.org). Game Theory has also become a central part of teaching in many of these fields at undergraduate, postgraduate, and continuing education programs, becoming therefore an essential theory not only for theoretical and applied research, but also as a relevant toolkit and a shared language for professionals and practitioners.

This entry provides a brief introduction to the large literature on Game Theory, discusses some salient results and applications, and presents key references for further reading.

### Origins and Four Traditions of Game Theory

Many ideas on strategic thinking have been discussed by a large number of authors throughout history, including Homer, Plato, Hobbes, Hume, Rousseau, Shing Tzu, Coutnot, Condorcet, Bertrand among others. However, the origin of Game Theory as a formal and explicit theory is often linked to Von Neumann and Morgenstern (1944) *Theory of Games and Economic Behavior*. Since then, Game Theory has made great advancement in four main traditions. *Cooperative Game Theory* examines the patterns of coalition or group formation among *cooperating* players and the distribution of the collective benefits of group cooperation, based on the key assumption that "rational" members would somehow manage to cooperate in order to seek mutual advantage. The underlying reasons and incentives to adhere

to such cooperative agreements however remain a "black-box" in Cooperative Game Theory (Binmore 2007). On the other hand, *Non-cooperative Game Theory*, as the name suggests, focuses explicitly on individual incentives and rationality without assuming or imposing that cooperation among players will necessarily arise. In a way, it is an attempt to open the "black-box" of cooperative behavior assumed in Cooperative Game Theory. In this setting, cooperation among individuals can indeed potentially arise as a result of their incentives and strategic considerations, but they can also lead to outcomes of competition and conflict among players, expanding therefore the potential to understand a wider array of observed outcomes in human affairs.

*Evolutionary Game Theory* (Smith 1982) studies how strategies may evolve in time and thus gain or lose ground against each other in a given population of players, driven by mutation and selection in an evolutionary context. In Evolutionary Game Theory, strategies are therefore not the result of deliberate rational choice by individuals as in Non-cooperative Game Theory, but are instead driven by evolutionary pressures and replication mechanisms such as imitation, learning, experimentation, and, of course, genetic replication and mutation.

In spite of the large fundamental differences in these three traditions of Game Theory, there have been efforts to connect and reconcile the three with some success. For example, an Evolutionary Stable Strategy – a key solution concept in Evolutionary Game Theory – corresponds to a Nash Equilibrium in Non-cooperative Game Theory, suggesting that Nash Equilibria can (and often probably does) arise as the result of long-term evolutionary pressures (e.g., by experimentation, learning, and imitation) and by not by deliberate short-term rational choices by players. Another example of convergence is the so-called "Nash Program," which is an attempt to study how sequential bargaining among rational players in a noncooperative context can lead to the cooperative outcomes identified in Cooperative Game Theory (Samuelson 2016).

However, since Non-cooperative Game Theory has focused directly on individual incentives and rational choice, it is arguably the branch of Game Theory that has had the largest influence and volume of applications across disciplines, being also the one most widely taught and learned at all levels.

In recent decades, a fourth area of Game Theory has emerged, namely Experimental or Behavioral Game Theory, which is devoted to the understanding the *empirical* behavior of players often in controlled lab settings but also in the field, and the way in which observed behavior confirms or departs from the theory, for example, as a result of bounded or limited rationality, risk aversion, social norms, altruism, ethical values, or preferences for redistribution and equality (Camerer 2003). This forth area has allowed Game Theory to further develop in order to bridge the gap between theory and evidence, especially Non-cooperative Game Theory, which we discuss in the rest of this work.

## A Snapshot of Non-cooperative Game Theory

Standard Non-cooperative Game Theory is divided into four main types of games, which capture different salient strategic environments. Each of these types of games in turn has different solution concepts (theoretical predictions on how games "ought" to be played by rational players).

Games require (i) players, (ii) a set of available strategies for each player, and (iii) individual payoffs (or *"utility"*) for each player associated to each possible combination of strategies chosen by all players. Simultaneous Games of Complete Information are games where players choose their strategies simultaneously, that is, without knowing the strategies being chosen by the other players. What matters for simultaneity is not the chronology of the choices, but rather whether others' chosen strategies are known at the moment of choosing one's strategy. An example of such setting is the bids by participants in a seal-bid auction. On the other hand, dynamic games exist when some players have knowledge of (at least some of) the previous moves by predecessor players at the moment of choosing their own

actions, for example, in cooperation or retaliation games, in which players can condition their actions to their predecessors' past actions. In games of Complete Information, players know other players' payoff or utility structure (e.g., their motivations or characteristics). If at least one player knows little about other players' payoffs or utility functions, the game is one of Incomplete Information, for example, in reputation-building games. To fix ideas, a one-shot bidding game in a seal-bid auction among participants that know each other well from prior interactions (and thus know each other's values of the items in the auction) may be better captured by strategic environment of complete information, whereas a bidding game where participants are faced for the first time and know nothing of each other's private values of the item sold by auction is better captured by a game of incomplete information.

The previous taxonomy provides four basic types of games in noncooperative game theory: simultaneous games of complete information, simultaneous games of incomplete information, dynamic games of complete information, and dynamic games of incomplete information, as shown in Table 1.

## Nash Equilibrium

A cornerstone of Non-cooperative Game Theory is the solution concept of Nash Equilibrium. Consider an n-player game where player $i$ has a set of pure strategies denoted by $S_i$ where $s_i \in S_i$ is a particular strategy, and where player payoffs or utility are given by $U_i(s_i, s_{-i})$, where $-i = \{1 \ldots i-1, i+i \ldots n\}$ denotes all the players other than $i$. The profile of strategies $(s_i^*, s_{-i}^*)$ is a pure-strategy Nash Equilibrium if for all players $i$ and for all $s_i \neq s_i^*$, the condition $U_i(s_i^*, s_{-i}^*) \geq U_i(s_i, s_{-i}^*)$ is satisfied. This condition implies that each player must be playing their best responses to the other players' equilibrium strategies. Therefore, once a Nash Equilibrium is reached, no player has a strict incentive to deviate from the equilibrium and it is thus stable. Note that a Nash Equilibrium requires that all players correctly anticipate other players' strategies, which may happen by learning, social norms, preplay communication, adaptation among other reasons. Table 2 presents a series of two-player canonical simultaneous games, which describe salient strategic environments, where the strategies and payoffs of players "row" and "column" are presented in matrix form. In a given cell jointly determined by row's and column's strategies, the number to the left of the comma (,) is row's payoff or utility, and the right hand side number is column's payoff. The payoffs corresponding to the Nash Equilibria of each game are highlighted in bold.

Game (a) is a Coordination game, illustrated by the choice of keyboard, an assuming that an alternative keyboard (Dvorak) is better than the widespread Querty keyboard, as some evidence suggests (see David 1985). Other examples of coordination games are technological choices more generally, or driving to the left or right hand side of the road. Game (b) depicts Rousseau's famous Stag Hunt or Assurance game, which is essentially an association or collaboration game, where both players (hunters) are better-off collaborating in order to jointly hunt a

| Not confess | −15, 0 | −1, −1 | Slack off | 2, 4 | 10, 2 |

stag instead of a hare each. Game (c) presents the "Chicken" or Hawk-Dove game, well suited to describe situations of conflict, for example, over a territory as nesting grounds in birds, or the famous bridge-game as in Nicholas Ray's *Rebel without a Cause* (1955). In political economy terms, labor/workers and capital/elite classes have been claimed to face similar strategic environments. Game (d) describes the famous Battle of the Sexes game, where a couple must agree where to go on a date or outing, and they have conflicting preferences over the alternatives (concert or park), as it happens in many negotiation environments. Game (e) describes the famous Prisoners' Dilemma game, where two prisoners must simultaneously decide whether to confess or disclose information (or not) of a crime and get leniency benefits. This game captures a wide range of cooperation strategic environments, for example, cooperation within groups, arms/nuclear races among nations (like in the Cold War when this game was proposed by Von Neumann in the RAND corporation, see Poundstone 1993), the well-known Tragedy of the Commons over common property resources, the provision of public goods, and collusion in oligopolistic markets, among many other examples. Finally, game (f) presents a simple stylized vigilance game, where a principal or boss must decide whether or not to watch or be vigilant, and a subordinate must decide whether to strive or slack off, as, for example, in organizations, parenting, or tax and law enforcement.

The games in Table 2 reveal some salient features of Nash Equilibrium. First, games may often have *multiple* Nash Equilibria, as in games a, b, c, and d. This indicates that strategic situations with similar players, payoffs, and strategies may yield very different outcomes according to the specific context in which a Nash Equilibria is established. Secondly, a Nash Equilibrium often is not a Pareto or efficient outcome (or "win-win" outcome): in game (a), (Querty, Querty) is Pareto-dominated by Nash Equilibrium (Dvorak, Dvorak) (supposedly a better keyboard); in game (b), (Hare, Hare) is Pareto-dominated by Nash Equilibrium (Stag, Stag), and in game (e), (Confess, Confess) is Pareto-dominated by (Not Confess, Not Confess). Third, the Pareto-efficient outcomes of a game may not even be a Nash Equilibrium at all, as in game (e): (Not Confess, Not Confess) where both prisoners are better off is indeed not a Nash Equilibrium, suggesting that often individual incentives can lead to inefficient outcomes and collective tragedies in collective-action problems. However, such outcomes can sometimes be beneficial for society as a whole. For example, leniency programs to fight market collusion whereby firms that report collusive behavior get immunity or a reduction in fines is based on the expectation that individual incentives will lead firms to reveal evidence of collusion, as in the Nash Equilibrium of the Prisoners' Dilemma game. Finally, (pure-strategy) Nash Equilibrium may not exist in some games, as in Vigilance

game (f), suggesting that in these situations observed outcomes will be inherently unstable and seemingly probabilistic or random, (although mixed-strategy Nash Equilibria will exist if players are allowed to use mixed strategies, that is, play their pure strategies probabilistically, provided the game is finite in pure strategies and number of players (see for example Gibbons 1992)), without an obvious stable pattern or focal point.

## Dynamic Games of Complete Information

Dynamic games are often depicted using a multiple-player decision tree that captures the timing of choices of the players. Information sets are a collection of one or more decision nodes in the three in which the player standing on that node has an action to choose. Dynamic games of Perfect and Complete information are games where all information sets have only one node, reflecting that the players on every node know perfectly well where they stand in the tree. For example, Chess or Tic-Tac-Toe are examples of dynamic games of perfect information (provided that players have perfect recall of previous moves). On the other hand, a repeated game of Scissors-Paper-Stone is a dynamic game of imperfect information, as in every round players choose simultaneously among the three alternatives, and therefore, their information set associated with their choice in a given round has three nodes in this case.

One important result in dynamic games is that Nash Equilibrium is not a "reasonable" solution concept for these games, because often some Nash Equilibria may be supported by *"non-credible threats,"* that is, expectations about future actions by other players that they would not have incentives to implement. Consider, for example, the dynamic game of a potential entrant and a monopolistic incumbent shown in Fig. 1, which is a dynamic game of perfect information: both players know perfectly well where they stand in the tree at the moment of choosing their actions. In the first period, a potential entrant must decide between entering this market and challenge the

**Game Theory, Fig. 1** The two-period Entry Game

monopolistic incumbent, or stay out and invest elsewhere and get a payoff of 1. If the entrant stays out, the incumbent has a payoff of 4 (monopolistic rents). In the second period, only if the potential entrant has entered, the incumbent must decide whether to "Fight" the entrant (e.g., by strong price competition a la Bertrand, which fully dissipates both firms' economic rents), or "Accommodate" the entrant, for example, by reaching some form of soft competition or collusion where both firms obtain important rents (2, 2). The two Nash Equilibria of this game is {Not Enter, Fight} (since "Not Enter" is best response to the expectation of "Fight" by the incumbent if the entrant decides to enter), and {Enter, Accommodate}, since "Enter" is the best response to the expectation that the incumbent will accommodate if the entrant decides to enter, and Accommodate is best response to Enter in the first period. However, Nash Equilibrium {Not Enter, Fight} is "unreasonable" because it is sustained by a *noncredible threat* by the incumbent, namely that it will fight if the potential entrant enters, which the incumbent will not have incentives to implement (as $2 > 0$). For this reason, the recommended solution concept for dynamic games is the notion of *backward induction*, whose outcome is obtained by solving the game backwards: the entrant should anticipate that if she enters, the incumbent's best response is indeed to accommodate. And in this context the entrant is better-off by entering, and therefore, the "reasonable" Nash Equilibrium {Enter, Accommodate} is selected by backward induction. Therefore, backward induction refines the set of Nash equilibrium, removing the Nash Equilibria that are sustained by noncredible threats. The

generalization of this principle for dynamic games of imperfect information is that of Subgame-perfect Nash Equilibrium, which is defined as a Nash Equilibrium of the game that is sustained by Nash Equilibria in all future subgames of the larger game (parts of the larger game that lie ahead in the game tree). The idea again is that players that move earlier in the tree should anticipate that players moving in the future are rational and would therefore choose actions compatible with Nash Equilibrium in future subgames.

One salient result in dynamic games of perfect information is the first-mover advantage and the value of *commitment* present in many such games, in which the first-mover gains a strategic advantage by deliberately reducing his options in the future. Consider, for example, the well-known episode in the conquest of Mexico where Conquistador Hernán Cortés visibly destroyed his own ships during a stage of the conquest of Mexico against the Aztecs. By eliminating the escape routes, he would resort to if things got complicated for the Spanish in battle, he commits to fighting, thus turning the scenario into one of "kill or die," in which context Aztecs decide to negotiate to avoid a costly conflict. Another example of the value of commitment by first movers is the deliberate expansion of production capacity by a monopolistic incumbent in order to deter or restrict entry by potential entrants. The monopolistic incumbent can commit to keeping a large capacity over time by deliberately investing in specific assets (difficult to disassemble and resale) and by making long-term sales contracts (costly to breach), among other business strategies (Tirole 1988).

A well-known result in dynamic games of complete information is the so-called "Folk Theorems," because they were widely known by game theorists early on and were part of the folk wisdom.

**Two-player Folk Theorem**. Consider a two-player simultaneous game G that has a Nash Equilibrium with payoffs $(a, b)$ for players one and two, respectively, and in which there are non-Nash Equilibrium strategies that would yield payoffs $(c, d)$ for players one and two, respectively, where $c > a$ y $d > b$. Then, Pareto-improving payoffs $(c, d)$ can be reached by means of a Subgame-perfect Nash Equilibrium of a modified game where game G is infinitely repeated, provided that both players have an intertemporal discount factor $\delta \in (0, 1)$ sufficiently large.

Consider the Prisoners' Dilemma game in Table 1 (game e). The Folk theorem indicates that if both players play this game repeatedly with an infinite horizon, they can unfold strategies for the repeated game that would allow them to reach the Pareto (efficient) outcome with payoffs $(-1, -1)$ in every round of the repeated game, as long as both players value future payoffs sufficiently. An example of a strategy that would make this possible is the so-called "trigger strategy": "I will begin cooperating (not confessing) and will continue to do so as long as you also cooperate. However, if in a given round you do not cooperate, then from the next round onwards I will punish you by not cooperating in the remaining rounds of the game." If both players employ this strategy in the infinitely repeated game, the temptation to seek the largest possible payoff 0 in the short-term by confessing in a given round must be compared with the long-term loss of being punished and having payoff $-10$ instead of payoff $-1$ forever if they continue to cooperate. As intuition would suggest, only players that value future payoffs sufficiently would resist the short-term temptation and would continue to cooperate. Note that the punishment implicit in the trigger strategy is indeed a credible threat, because it consists of playing a Nash Equilibrium (not cooperate forever) of the subgame that begins after a player has stopped cooperating. That is the reason why this outcome is a subgame perfect Nash Equilibrium.

The Folk Theorems provide an "optimistic" perspective for the possibility that groups can find the way to achieve Pareto efficient (or "win-win") outcomes in collective-action problems, for example, in the provision of local public goods or in the management of common property resources, or in cooperation within organizations and groups. However, the bad news is that in some cases outcomes based on the Folk theorem would be detrimental to the welfare of society at large, for example, if firms in an oligopolistic markets manage to collude based on the disciplinary incentives of the Folk Theorem (Tirole 1988).

A one-sided version of the Folk theorem can be applied to markets characterized by contingent renewal, where on party can decide to renew the relationship based on past performance. For example, in labor markets, employers can renew an employee's contract if her past effort and performance are satisfactory, and the same can happen in service markets. In credit markets, banks can stop lending to clients with bad payment history. In such markets, an equilibrium can arise where the renewing party can offer a premium to the other in exchange for good behavior, but if bad behavior is observed, the contract is not renewed. Such equilibria are inefficient. For example, in labor markets, unemployment arises because it is needed to make costly the threat of being fired if past effort is unsatisfactory. In such markets, "power" is transferred to the renewing party, which can control the other party's behavior ("money talks, people listen"), a rather different situation from the symmetrical and impersonal textbook portrayal of competitive markets (Bowles 2004).

## Games of Incomplete Information

The games discussed above are all games of complete information, that is, players face strategic choices in a context where they know the motivations, characteristics, and ultimately the payoffs (or utility functions) of the other players. This is hardly a satisfactory assumption in many strategic situations. For example, the organizer of an auction often knows little about the bidders' private value of the goods to be sold by auction, and the bidders themselves probably know little about the other bidders' private value of the goods. In insurance markets, insurance companies know little about the profile and health risks associated with specific clients, and in labor markets employers know little about the ability and productivity of an applicant to a job. Similar situations would arise more generally in all markets with *asymmetric information* (Stiglitz 2000). Asymmetric information also arises in social groups and organizations, for example, when individuals are uncertain about the ethical predispositions, honesty, and intentions of other individuals.

Games of incomplete information capture the key elements of strategic environments when players know little about other players' preferences or utility functions. Games of incomplete information can also be simultaneous (or static) or dynamic (multiple periods). An example of a static or simultaneous game of incomplete information is a sealed-bid auction, where participants must simultaneously choose their bids and may know little about the private value of other participants (or the other firms' cost structures in a construction public tender, for example). A relevant application of such games is the literature of *mechanism design*, which has been successfully applied to design public auctions to allocate valuable public assets to private companies, such as batches of telecom frequencies sold by auction. Such auctions designed using Game Theory and mechanism design have very often succeeded in allocating important public assets to the most efficient companies, while raising large amounts of money in revenue (Binmore 2007; Milgrom 2004).

Other strategic contexts of incomplete information are better captured by *dynamic* games of incomplete information. One example of such games is the so-called *signaling games* in contexts of asymmetric information. In these games, a player called the Sender has private information about his or her "type." The Sender can thus take an action in order to send a signal to another player called the Receiver in order to reveal (or conceal) its type. For example, in labor markets, workers often know more about their own intrinsic abilities and potential productivity than employers. Suppose there are two types of workers: the high-ability types and the low-ability types. Of course, an applicant claiming in a job interview to be a high-ability type and to be very productive may not necessarily be believed by the employers, as such a statement would be considered "cheap talk." However, high-ability workers can attempt to send a credible signal to employers to convince them of their high ability. One way of doing it is to enroll into a demanding higher education program: if high-ability workers enroll in more difficult degrees and programs than lower-ability workers, then education would become a credible signal of high ability, which

would lead to higher wages and better jobs for the higher-ability workers. In order for education to work as a credible signal of high ability, achieving an extra degree should be more costly for low-ability workers than for high-ability workers, condition that is known as the *single-crossing condition*. If this condition is satisfied, such higher education degrees would receive (mostly) high-ability workers because it is not worth for lower-ability type to face the hardship of going through a degree for which they are hardly suited for. Therefore, in a separating equilibrium, the high-ability workers would succeed in separating themselves from the lower-ability types by enrolling in more selective and demanding programs and universities. Accordingly, the employers (the signal receivers) would resort to Bayesian updating to conclude that the posterior probability that an applicant graduated from a demanding higher education program is a high-ability type is close to one, and would be willing to offer her a high salary. Note that in this context workers with more years of schooling and/or graduated from more demanding programs and universities would, on average, have higher wages. However, this wage premium would not necessarily measure the real impact of the program on the students' productivity in the labor market, but it would also capture the effect of the ability-sorting effect. There is a significant empirical support for the idea that higher education partly exists as a device to signal innate high ability to the labor market, and not only to develop skills and knowledge for real jobs in the labor market (Weiss 1995).

## Further Reading

The literature on Game Theory is vast. In addition to the references quoted earlier, Binmore (2007) provides an excellent nontechnical introduction to Game Theory, as well as broad reading list on various dimensions of it. The appendix in Tirole (1988) provides an excellent and compact technical description of the essentials of Non-cooperative Game Theory. This textbook also presents many models of Industrial Organization based on Game Theory. Gibbons (1992) and Fudenberg and Tirole (1991) are widely used textbooks on Non-cooperative Game Theory. Gintis (2009) provides an interesting problem and example-centered textbook on Game Theory. Laffont and Tirole (1998) discuss applications to procurement and economic regulation. Nalebuff and Dixit (1991) discuss applications in a less formal way. Samuelson (2016) offers a discussion of the current state and future challenges of Game Theory. Camerer (2003) provides a review of *Behavioral Game Theory* and the way empirical evidence confirms and departs from the predictions of Game Theory. Binmore (2005) discusses applications of Game Theory to Ethics and Moral Philosophy. Ordeshook (1986) discusses applications to Political Science. Nasar (1998) is a best-seller on the life of Nobel-prize winner John Nash. This book and Poundstone (1993) describe the Cold War context in which Game Theory expanded rapidly after WWII, especially by the work of fellows of the RAND Corporation in the United States.

# Gaps and Transparency Challenges in Contract Outsourcing

Lina Vyas
The Education University of Hong Kong, Hong Kong Institute of Education, Hong Kong, China

## Synonyms

Civil service training; Contract management; Outsourcing; Principal-agent theory; Stakeholder analysis; Transaction cost theory

## Definition

Contract outsourcing is the private sector involvement (PSI) in the delivery of public services. Contracting out is a contractual arrangement between the government and the private sector for the delivery of services.

## Introduction

Outsourcing has become popular in the public sector because of the perception that governments are intrinsically inefficient (Huque 2005) and that the private sector is more economic, efficient, and effective than the public sector (Amagoh 2009). Government institutions have resorted to outsourcing primarily as an efficiency measure. Where government is inadequate in terms of expertise, personnel, and time spread across overlapping issues, the private sector can muster the necessary resources to achieve desired results. Outsourcing enables bureaucrats to implement plans without unnecessary strain on government departments that are already facing pressures to downsize and decentralize operations and further retool and capacitate personnel to meet evolving demands. But while outsourcing is an acceptable practice, it straddles on issues that question the extent to which processes are transparent and free of undue influence and selfish interests. And, although significant, oftentimes how these issues are viewed from the perspective of bureaucrats and contractors in the context of their appreciation of their roles vis-à-vis their capabilities is neglected. The paper seeks to expand current literature to cover gaps in terms of the requirements of outsourcing, as perceived from both bureaucrats and contractors, and the attendant processes of private service provider identification, contract development and management, contract implementation, and output evaluation. This paper argues that the perceptions of bureaucrats and contractors, particularly in Hong Kong, influence the efficacy of contractual relationships, which determine the success of outsourcing in the public sector.

## Theoretical Viewpoint

This study is pursued against two theoretical underpinnings: transaction cost theory and principal-agent theory. In sum, both theories explain the rationality of the relationship between bureaucrats and contractors from considerations involving costs and resources and the dynamics

between varied roles being utilized for common goals. Transaction costs theory suggests the viability of outsourcing in terms of the complexity of the contract and the resource requirements. It points to an indirect proportionality of both (contract complexity and resource requirement) to the viability of outsourcing. The principal-agent theory explains the relationship between the principal (bureaucrats) and agent (contractors), and how can compromise the other in the absence of certain features and mechanisms, and in the face of unmet expectations. In this study, both bureaucrats and contractors work within highly politicized Hong Kong where there is a growing demand from civil society for efficiency and accountability from government. Yet in the appreciation of the theoretical underpinnings of this study, we find out a gray area in the values of healthy competition and fair play that the Hong Kong government espouses from the situation on the ground as viewed by bureaucrats and contractors.

## Contract Management

Outsourcing is regarded as not only a means to reduce costs and increase efficiency through the use of the market but also as a mechanism to enhance innovation and flexibility in public service delivery. However, some scholars find that outsourcing may erode the ethos of the public sector. These critics fear that any mismanagement may result in higher costs in service provision and lower service quality, such as might occur with any improper handling of competitive tendering and outsourcing.

Contract management is frequently regarded as a practitioner issue in those contracting studies that focus on the relationships between governments and contractors, performance evaluation, and decision-making on contracting (Schick 2011). An aspect of recurrent critical concern is that the quality of service can be affected by the improper handling of competitive tendering and outsourcing. In such cases, interorganizational collaboration among principals for scarce resources may be undermined, intensifying rivalry among competing agents in contract bidding, thus causing longer-term accountability problems in service delivery (Huque 2005).

## Outsourcing Utilization

Outsourcing was initiated in the 1980s in Hong Kong and grew in volume and frequency during the period of the Asian financial crisis in 1997–1998 that brought the economy of Hong Kong to a new low, and unemployment rate was at a record low. This was also the same period when civil society was more vocal about the need for more efficiency, transparency, and accountability from the Hong Kong government. From that period, government bureaux and departments (B/Ds) have increasingly hired external service contractors to deliver public services.

Public procurement in Hong Kong is subject to scrutiny of the Independent Commission Against Corruption (ICAC) of Hong Kong, which is independent of the civil service and answerable directly to the chief executive. To assess the utilization rate of outsourcing as a strategy in public procurement in Hong Kong, the Efficiency Unit (EU) conducted biennial surveys of the government's outsourcing trends from 2000 to 2012. Covering the 2012 outsourcing situation, EU (2013) administered the survey to 81 government departments and 3497 service providers with active outsourcing contracts with the government. Survey results revealed a significant increase in both number of contracts and total contract value of 26% and 22%, respectively, compared to data in 2010.

Figure 1 shows an annualized outsourcing expenditure of HK$31.7 billion in 2000. This amount almost doubled to HK$62.9 billion in 2012, with 66% of the government outsourcing contracts involving capital works and construction and building and property management services.

Figure 2 shows an increase in the total contract value in 2012 over 2010, attributed mainly to start of major capital works projects, such as the Hong Kong-Zhuhai-Macao Bridge Hong Kong Link Road. EU (2013) adds that the increase in the

total number of contracts in 2012 over 2010 is largely due new IT projects and the procurement of more IT services, replacing non-civil service contract staff.

## Skills Requirement in Outsourcing

The contract administrators from the public sector indicated that the transaction costs incurred in outsourcing were nearly always ignored. These costs pertained to the resources required for arranging comprehensive trainings for public officials on contract management – developing, maintaining, and monitoring contracts. Without hands-on experience in managing contracts, most of the bureaucrats resorted to self-learning and made decisions based on personal experience. Operating in strained resource environments, the administrators found their capacity to provide adequate oversight and contain opportunism severely challenged. Contractors, on the other hand, stated that they were not informed of government rules and provisions, procedures, practices, and regulatory and government auditing standards and requirements, causing them to inadvertently violate without their knowledge. To avoid the risks, they had to exhaust additional resources to study government rules and regulations. To public managers, additional controls are required when contractors are unfamiliar with regulatory requirements.

Both the bureaucrat and the contractor agree on the necessity of improving professional techniques and skills of the contractor; however, both blame the other side for insufficient information or inadequate training. The bureaucrat expects the contractor to be equipped with knowledge of government rules, the necessary skills, and initiative to keep up with progress through self-learning. However, the contractor expects more assistance from the government in understanding the rules and protocols in the contract (e.g., explicit explanation about details in the contract). Clear guidance from the government would save the contractor time and effort from guessing and trailing by mistakes.

Based on the transaction cost theory, organizations compare costs between internal and external delivery modes before deciding on outsourcing

**Gaps and Transparency Challenges in Contract Outsourcing, Fig. 2** Distribution of annualized expenditure by outsourcing service category

activities. Thus, transaction costs related to managing contracts effectively should be taken into consideration because such costs can lower the net benefit of contracting out. Offering public managers the necessary tools will also help them mitigate contracting risks, stave off, and correct incomplete and even failed contracts (Brown and Potoski 2003). As Brown and Potoski (2003) point out, any increase in the percentage of public goods contracted increases the likelihood that governments will invest in contract management capacity. Ongoing contract management training may be provided during induction as well as regular refresher training for bureaucrats to assist them in dealing with other stakeholders.

## Lack of Communication

Both bureaucrats and contractors identified a lack of effective communication in the contracting process. The bureaucrats recognized the importance of communication in enhancing transparency, helping contractors compete, evaluate risks, and deliver stable services. Despite the importance public managers put on communication with contractors, they have been unable to achieve desired benefits. Contractors describe their communication with the bureaucrats as largely limited to reporting work progress or submitting deliverables.

The contractors were also frustrated at the failure of government to communicate their expectations and changes in contract requirements. As a result, some incurred losses. Majority of the contractors did not think that government contracts offered openness, fairness, and transparency. Obtaining information from government in the pre-contractual period and throughout the contracting process was difficult, even if the information requested was crucial for contractors to determine the extent to which they can fulfill the contract. With limited information "essential for determining the scope of bargains," the contractors lamented inability to draw up competitive offers.

The communication discrepancy is attributed to separate, incompatible systems adopted by the

bureaucrats and the contractors to communicate, which result in poor collaboration. Lack of constant and current communication channels also lead to failure in immediately arresting problems and potential crises.

## Transparency and Reliability of Information

Bureaucrats lament the absence of previous service records of tenderers, plan financial resources, and estimate expenditure to allow them to better assess contractors. The bureaucrats in the interviews were concerned about the price-based principle in evaluating bids and tenders. They suggested developing a system to help them track previous service records of tenderers, plan financial resources, and estimate expenditure. Hence, while the capabilities of contractors and their previous service records can be crucial to suitability in being granted an outsourcing contract, such factors are not taken into account in the tender evaluation stage.

Contractors are also not required to disclose certain background information in the pre-contractual period, so they are not known to the bureaucrats until the contract begins. Public managers shared that some contractors may offer extremely low prices to win the contract (adverse selection), but eventually exhibit opportunistic behaviors, offering substandard goods or services during the post-contractual period (moral hazard).

## Effective Monitoring System

Majority of the bureaucrats in the interviews considered it essential to establish detailed service standards to facilitate their assessment of contractors' performance. But due to lack of skills, they cited difficulty in designing and carrying out outsourcing programs for optimal results and measuring contractors' performance. To make up for this, government officials hire consultants and experts in information systems (IS) management, a cost concern that bureaucrats try to minimize.

Bureaucrats also expressed concern over the length of contracts, which hold implications on both market and effective monitoring. Long contracts could come with greater risks of inadequate performance and reduce the policy flexibility available to them. Public managers were also anxious that in limited competitive markets, long contracts would create a monopoly, causing contracts to control prices which in turn would encourage them to charge monopoly prices. Eventually, the government would incur high costs of tendering, monitoring, and evaluation to control opportunism, especially where the outsourcing activity is difficult to quantify.

On the other hand, contractors half-favored long contracts and preferred a number of small-scale and related contracts integrated into large-scale ones. Long and large-scale contracts offer better income opportunities, lower transaction costs, and more prospective planning.

## Compliance with Contract Requirements

To verify contractors' compliance with the contract provisions, government officials conduct regular and spot-check inspections. Contractors, however, resist openness and transparency, preferring to minimize costs of compliance. They indicated in the interviews that they did not favor spot-check inspections during the contracting process as they would be caught unprepared. Spot-check inspections refer to out-of-routine check that is carried out in the normal course of audit, which are intended to ascertain whether a system of internal control operates effectively. They preferred being informed of both details and frequency of monitoring and inspections in advance. Contractors were also upset to spend a great deal of resources completing numerous reports.

Spot-check inspections and regular reports and returns help bureaucrats track the progress of the outsourcing contracts. To ensure compliance and enhance transparency, the government can offer incentives to encourage voluntary adoption or impose sanctions for noncompliance. Some jurisdictions encourage contractors to self-audit

themselves by offering reduced penalties and technological audit resources (Madu and Kuei 2012). For discentives, according to the Hong Kong government (Legislative Council Panel on Public Service 2011), contract breaches are monitored through a service-wide demerit point system and can bar contractors from joining future government bidding.

## Limitations

The research data were based on interviews with the senior and frontline public managers with extensive contract management experience, as well as the contractors with extensive contracting experience with the Hong Kong government. However, due to the perceived sensitivity of the information required by some interview questions, majority of the civil servants invited to participate in the survey declined, further limiting access to quality respondents. In addition, the findings of this study are based on the perceptions of the interviewees; therefore, they may not be generalizable. The sample undertaken for this study was also limited to the senior contract managers, further reducing the population of the interviewees. Another challenge was selection bias, a common problem for snowball sampling when interviewing people who have relatively high homogeneity. Although previous interviewees were discouraged from discussing the research topic and questions with their referrals, the results of the interviews were still not as desired as those from random sampling. The nature of the study is also inductive; the exact number of interviewees was not conclusive until the research was in process.

## Conclusion

The success of contract administration in outsourcing depends largely on a two-way transparent relationship between bureaucrats and contractors. This kind of working relationship empowers both parties to ensure efficiency in the execution of the contract in the best interest of the public.

Outsourcing ideally reduces the role of government in delivering public services, but government retains control over the contracting process. There appears to be more interest in downsizing the responsibility of government in this area over increasing efficiency and quality, even if bureaucrats lack the necessary training and skills to effectively fulfill this particular role. Governments to address issues of transparency as regards contract requirements, background information, and scope and date of inspection, among others, demonstrate failure on the part of public managers to reconcile their decisions and actions with the expectations of contractors. It appears that Hong Kong can barely support the development of new roles and skills among bureaucrats. Bureaucrats still rely on a hierarchical control-based approach within a highly politicalized environment. Within a politicalized context where there are multiple actors and stakeholders with conflicting objectives, outsourcing then remains a severe challenge for public contract managers in Hong Kong.

# Garbage-Can Model of Organizations

Nancy S. Lind and Taryn Butler
Department of POL, Illinois State University, Normal, IL, USA

## Synonyms

Ambiguity; Flexibility; Organized anarchy; Organizational fluidity

## Definition

Garbage-can model of decision-making **is** a form of decision-making often used to explain choices made in higher education that views organizations as choices looking for problems and solutions looking for issues.

## Introduction

The Garbage-Can model of organizational decision-making was originally developed by Cohen et al. (1972) to describe organized anarchy. The model attempts to explain organizational decision-making anomalies. In particular, according to Maister (1983), this model is most relevant in decisions made by "organized anarchies," or those which attempt to conduct themselves on democratic, consensus-building principles. Cohen and March, in their book *Leadership and Ambiguity*, defined "organized anarchy" organizations as having some of the following characteristics:

First, an ambiguity of goals with inconsistent, poorly defined preferences and numerous objectives. Due to this aspect of ambiguity, very few problems are resolved by adhering to indisputable and universal (or prioritized) goals within the organization.

Second is an unclear technology, consisting of activities such as teaching, lawyering, consulting, and other professional services which have fairly ambiguous processes. In these activities, there are some consistencies or regularities in terms of standard procedures, yet the activities themselves are considered an "art" to be learned through various experiences, imitation, inventions which are born out of necessity, and trial and error.

The third characteristic is that of fluid participation within these organized anarchies. Members differ in the amount of time and effort they put forth into the concerns of the organization. Sometimes, one actor will focus only on his or her own personal work while leaving the goals and decisions of the organization in the hands of others. In other cases, some may be exceptionally concerned with the organization as a whole and wish to be involved in its affairs. Determining the degree of participation of each member cannot be discerned from an organizational chart, but rather on the basis of the issues being addressed, timing of the issues, and temperament of the issues and/or actors.

Fourth, many of the issues faced by these organizations have little significance to most people in a majority of situations. The decisions made are often only the product of partial, sometimes erratic, attention from participants. A majority of the support or attention given to a particular issue is more representative of the problem's symbolic significance or of the impact it has on the group's esteem than it is of the content of the problem.

As a result of this small significance of issues facing the organization, there is a high level of inertia present, meaning that it takes a great deal more effort and energy for anything to be changed. Typically, there is a minimum amount of effort being put into most decisions, problems, and choices within these organizations, therefore there is also a tendency to continue past policies, procedures, and patterns so as to avoid effort as much as possible.

Lastly, the final characteristic of organized anarchies is that most have a weak information base. The information and data needed to make an educated and informed decision is nonexistent more often than not. Most of the time, this information is not collected or properly disseminated. Perhaps this lack of collection is due to the unclear technology or it could be due to the fact that most

issues are of low participation and low significance to a majority of people within the organization and therefore there is no incentive or motive to collect the necessary information required for informed decision-making.

## Consensus-Based Organizations

These organized anarchies are political, consensus-based "democracies," whether they are law firms or national assemblies. Cohen et al. (1972) studied universities, which are a well-recognized example of organized anarchy. Their findings from this observation were that organizations such as these could be viewed as a collection of choices looking for problems to solve, decision situations in which issues and feelings might be aired, and various solutions looking for a problem to which it may be the answer as well as decision-makers looking for decisions to be made.

These organized anarchies relate to the garbage-can model of decision-making because this model is seen as a process which changes the actual problem facing the organization. Many claim that there are four basic components which can influence decisions: problems, solutions, participants, and choice opportunities. Within the garbage-can model, there could be any combination of the four components, and how they will be mixed is unpredictable. In garbage-can decision, situations, problems, solutions, and participants frequently move from choice to choice. In situations that fail to adhere to the conditions of more classical models of decision-making in some or all of three important ways: preferences are problematic, technology is unclear, or participation is fluid, the garbage-can model is found.

The "garbage cans" in this model are choice opportunities like meetings, committees, and any other decision-making forums. The four components mentioned above are also contained within the choice opportunities. Each of the components flow in and out of the garbage can, which results in solutions getting attached to problems almost solely by chance.

In the garbage-can environment, no obvious or clear rules exist for linking problems and solutions together so as to ensure the resolution of problems (Giesecke 1991). There is an overall theme of unpredictability associated with the garbage-can model which can be seen in the difficulty of discerning organizational goals, objects, rules, and regulations. It is also rather complicated to predict or determine which participants will be present at any given choice opportunity (such as a meeting, for example) where decisions on problems and solutions could possibly be raised or acted upon. As a result, decisions are rarely, if ever, made through the conventional method of "comprehensively rational" policymaking. In this traditional model of rationality, decision-makers or actors first identify the issues or goals facing the organization. These issues are then analyzed and studied so as to generate several diverse solutions or ways to reach their goals, followed by the decision-makers selecting the solution that best fits the problem. Instead of this traditional model, oftentimes the solutions may be present well before the problems ever present themselves to the organization. Any number of individual issues, solutions, and participants can be introduced into various choice opportunities. The process of making decisions in the garbage-can model is extremely unpredictable, and there are a few different methods typically used in this approach.

Within organized anarchical organizations, decisions can be made in three ways. The first is *by resolution*. This refers to the more traditional model of decision-making in which choices resolve problems after working on solving those problems for a period of time. The amount of time it takes to resolve issues can vary depending largely upon the number of issues the organization is facing at that particular time. The second method of decision-making is *by oversight*. In this method, a choice is made and put into action while problems are attached to other choices. This choice is typically made quickly and with as little attention to existing problems and as little energy spent as possible. Choices in this method are made quickly so as to avoid having problems drift over into the current choice that is being made. This

choice solves nothing, since the problems were attached to a different choice and therefore the choice is more symbolic than practical. The third method is to make decisions *by flight*. In these situations, choices are associated with problems for a certain period of time until a more attractive choice presents itself for the problem. The problem will leave the choice that the organization was sitting on, so with the problems no longer being attached to that choice, it becomes possible for the organization to make the decision. Like the oversight method, the flight method of decision-making also fails to resolve any problems, because the problems have moved on to another, more favorable choice (March and Olsen 1976: 8; Weick 1979, 21). Besides the first method of making decisions by resolution, the oversight and flight methods either try to make a choice before there are even any problems to deal with or simply wait out the problems and hope that they go away before a choice even needs to be made.

The outcomes that result from the decision-making methods within the garbage-can model are not always reflective of the intentions of the decision-makers. Leaders within organized anarchies can still play a positive role in decision situations. In the garbage-can model, leaders can make a difference in a variety of ways such as: carefully timing the creation of issues, remaining cognizant of the ever-changing interests and levels of involvement of participants, diagnosing the status and power implications contained within all choice opportunities, knowing when to abandon programs/projects/proposals when they become tied too closely with others, and appreciating that the planning process is merely symbolic in a majority of situations and is typically just an excuse for interaction within the organization.

Cohen, March, and Olsen's garbage-can model of organizational decision-making has been reconstructed by Fioretti (2013) into a more agent-based model. The original garbage-can model states that actors in organized anarchical organizations can delay making decisions. Fioretti (2013) builds on to this postponement of decisions by adding in another possible method to avoid making decisions: buck-passing, or passing difficult issues and problems along to colleagues to avoid having to make a decision. This method emphasizes the selfish nature of individuals within organizations, yet it does not suggest the fruition of dysfunctional consequences for the organization as a whole. Simulation experiments conducted validate and develop further some of the conclusions drawn from the garbage-can model of decision-making. These experiments demonstrate that a majority of decisions are made without resolving any problems, which has been stated as a defining characteristic of this model. The organization ends up creating a cycle by not solving these issues, continually making decisions which do not accomplish any specific goal or conquer any problems. Any problems which are actually solved are usually handled only at the lower levels of the hierarchy within the organization. The conclusions from these simulations identified a consequence that was previously omitted, or possibly overlooked, which was the idea that top executives in organizations do not need to be strong problem-solvers because many of the issues which are actually tackled are taken care of at lower levels.

An example of the garbage-can model can be seen in the actions which took place in Hazelton, Pennsylvania in 2006 through the local government's response to increasing numbers of unauthorized migrants in the community. While there was no way to determine the exact number of undocumented migrants living in Hazelton, estimates believed the Hispanic population was between 11,000 and 12,000, with roughly 1700–2400 of those suspected to be unauthorized migrants. Many migrants moved to Hazelton to find work, education, safety, security, and an overall better life (Bressler and Delaney 2002). This influx of migrants created debate among some who claimed that undocumented migrants were taking a toll on the economy while others believe this to be false (Lipman 2006). However, the American Immigration Law Foundation stated that while undocumented migrants may pay more in federal taxes, they are still costing *state and local* governments more in services (Paral 2005).

These migrants, then, are leaving local economies struggling to pay to provide services to their

communities. This point is validated by examining data from the City of Hazelton where it is found that in the years surrounding 2006, there was a continuous rise in services provided but no rise in revenue from local taxes on wages. Services such as health care and education became highly taxed and many businesses saw losses in income. The Hazelton Area School District increased tremendously in student population, resulting in overcrowding. The number of English as a Second Language Programs rose also, costing the district a substantial amount of money. The number of undocumented students was unknown but estimated to be high due to the lack of English spoken and lack of paperwork by many students.

City officials noticed the increase in unauthorized migrants in the area. A trend of violent crime committed by Hispanic individuals, most of them undocumented migrants, that began in fall 2005 prompted the Mayor and city council of Hazelton to believe there needed to be an ordinance. Having no other options, the Mayor searched online for a solution which would meet the needs of Hazelton and found an ordinance in San Bernardino, California which dealt with "illegal aliens" (Dorell 2006). The Illegal Immigrant Reform Ordinance was formed on the foundation of partial statistics, assumed information, and the need to act swiftly. Hazelton could be described as an organized anarchy during this time, which created the perfect atmosphere for the garbage-can model of decision-making. The city's lack of means to deal with the problems locally led officials to search elsewhere for answers. The shortage of information collected on undocumented migrant crime statistics and the unwillingness of the federal authorities to assist in the issue resulted in the Mayor searching for his own solution. The vague goal of reducing crime is characteristic of the garbage-can model, but the problem was not essentially solved through the created ordinance.

Hazelton was also accused of having unclear technology in the ordinance because there were no clear means of identifying undocumented migrants in the area. The ordinance faced legal issues and backlash from groups, mainly Hispanic organizations, which should have been included in the creation of such a piece of legislation. However, the Mayor stated that none of these groups spoke openly about the issues facing Hazelton or came out publicly against the violent crimes being committed. Local businesses and organizations, instead of taking positive action, used this ordinance to protest the actions of the Mayor and city council for discriminating against anyone they believed to be foreign (Hall 2007). Before many local groups had a chance to respond to the ordinance, national organizations stepped in, forcing the Hazelton community to argue their cases on the national level. A court case was filed then heard in the US District Courts where the ordinance was ruled unconstitutional. Both sides continued to fight over the policy in court.

The focus of this issue is the local government's responsibility to protect its own citizens versus the federal government's right to handle immigration policy. Hazelton was a community experiencing transition in their increasing numbers of immigrants, which led to the inability of local government to make an effective decision regarding the reduction of violent crime. The Mayor and city council sought answers to the problem elsewhere, yet the solution was ineffective. This is representative of the garbage-can model where decisions are made, yet problems are rarely solved. There was unclear technology on how to implement such an ordinance and there was a lack of sufficient research and data gathered to make a decision. The Mayor's choice of using the San Bernardino ordinance as a model is reflective of a choice being plucked by a participant and pasted onto the problem as a band-aid solution. The actions of Hazelton's government are a prime example of the garbage-can model in action.

## Conclusion

The garbage-can model is used to explain discrepancies in decision-making within organizations. This method is found most often in organized anarchies with poorly-defined goals, fluid participation, and problems which hold little significance to a majority of participants. It has been shown to be an ineffective method in which decisions made rarely solve any problems. Though it

seems to be counterintuitive for organizations to engage in this form of problem-solving, or lack thereof, organizational studies continue to find the persistence of the garbage-can model within organizations.

To sum it all up, organizations operate on the basis of inconsistent and ill-defined preferences. Various kinds of problems and solutions are dumped, and the mix of garbage depends on the mix of labeled cans available.

Board of directors; Corporate governance; Gender diversity; Group dynamics

## Definition

Gender and corporate governance within public organizations represents a relevant topic in organizational research related to the female representation in boards and top management positions in local administrations and state-owned organizations.

## Introduction

Diversity represents an important research domain for organizational studies, especially because of the greatest phenomena that occurred in the world, that is, the globalization, the internationalization of enterprises, the financial and economic crisis, the demographic changes in the workforce, and the increasing complexity of jobs. In many countries, the diversity debate is

mostly focused on the role of women in the workforce, as outlined by the spread of "affirmative actions" and "equal opportunity programs" to support the role of women within organizations. Despite their relevant socioeconomic progress in the last decades, women still face inequalities in compensation and status, and they are underrepresented in top management positions.

In European countries, the percentage of women in leadership positions was dramatically low until recently, both in public and private sectors. In many European countries, the improvement process is underway thanks to the introduction of government laws to promote women's representation in the boards of companies listed on the Stock Exchange and in companies owned by the public administration.

Although the increasing gender balance at board level was more than doubled from 2,8% in October 2011 to 7,1% in April 2015 (European Commission 2015), there is still an intensive public debate in research and practice on the concrete participation of women to board of directors' processes. Thus, it seems that women directors do not really play a relevant role in decision-making process of board of directors, also because maybe the qualification and merit criteria are not merely applied.

## Women Progress Driven by Regulatory Pressures: State of Art

In recent years, numerous European States passed a legislation that requires a gender quota for board of directors (Terjesen and Singh 2008; Francoeur et al. 2008). As first mover, in 2003 Norway prescribed a minimum target of 40% gender quota on board of directors in all public companies, as well as state-owned enterprises, becoming mandatory since 2006. Subsequently, Spain and Iceland followed Norway's footsteps. In Spain, this legislation was applied in 2007 to publicly listed companies and companies with more than 250 employees, to be completed by 2015. Iceland passed the law to all publicly listed companies and companies with more than 50 employees, which were required to have at least 40% of each gender represented on their board, starting in 2013 (Teigen 2012). In 2011, France, Netherlands, and Belgium adopted the corporate board quota legislation for private companies. In Italy, the quota law was approved in 2011 for publicly listed companies and state-owned companies where one-third of the seats on boards and supervisory boards were reserved for women since 2015. Indeed, the Golfo-Mosca was approved in Italy requiring the equal representation of women, at least one-third of the members of corporate boards, in public companies. Recent data from the Bellisario Foundation calculate that in 2016 there are about 800 women in the corporate boards and 200 in the boards of auditors. Furthermore, since 2015, with the second term, the mandatory gender quota will become 30%. According to estimate reports by the Bank of Italy, without a binding law, we would achieve gender parity in 2075 (Bank of Italy 2012; Bianco et al. 2013).

These values have been changing the mind of many skeptics, contrary to quotas because they feared that the choice on the basis of the gender would not depend on meritocratic criteria. But it is difficult for women to prove their worth if they cannot reach the positions to do it. The idea, outlined in Europe and the United States, is that companies, where there is more women not discriminated based on gender, are more open to work-life balance. According to a study recently published by Aspen Institute Italia (2014), companies with more women at the top positions have better withstood the economic crisis. The Bellisario Foundation wants to extend the threshold of 20% even at 4000 companies controlled by local authorities.

However, only few countries have adopted penalties for violations about gender quotas. For instance, Norway and Italy adopted a system of progressively serious penalties for noncompliance companies, including the payment of a pecuniary penalty, the cancellation of board members' compensation, or the revocation of board membership.

In 2012, considering the limited success of this legislation (the percentage of women on corporate boards increased from 12.5% to 20.7%), the European Commission proposed a mandatory directive to apply to executive and non-executive

directors of listed companies in private sector and state-owned companies. The overall goal was to achieve a minimum representation of 40% of women by January 1, 2018, for state-owned listed companies.

A central point of the proposal is the requirement of a transparent and objective recruitment process which requires specific details about "clear, neutrally formulated, and unambiguous criteria" for board selection (European Commission 2012, p. 1; Oliveira and Gondek 2014, p. 5). The law stipulates that if two candidates are found to be equal according to the criteria, the member of the underrepresented gender must be chosen. In addition, the proposal establishes an audit system; the companies must provide annually information and specific data about the gender representation in their boards, as well as measures applied for ensuring a transparent recruitment process. This information must also be published on their website to ensure that it is accessible to anyone interested. Each member state would determine which sanctions could be imposed on companies that do not comply; these measures must be "effective, proportionate, and dissuasive" (Oliveira and Gondek 2014, p. 7).

## Group Dynamics in Board of Directors

Board of directors represents the most important governance mechanism, with the relevant purpose to support management through counseling and advice and to protect stakeholders against managerial misconduct. According to Forbes and Milliken (1999), boards of directors are large, elite, and episodic decision-making groups that face complex tasks pertaining to strategic-issue processing. Because boards mainly produce a cognitive output, such as strategic decisions, they require a high degree of specialized knowledge and skills to operate effectively. Drawing from the literature on group dynamics, most empirical studies suggest that demographic diversity in these groups – many persons with different backgrounds, experiences, competencies, and culture who meet together to deal with complex problems – may be advantageous to the decision-making process, because the greater range of perspectives and specialized knowledge and skills provided by heterogeneous members promotes more information search, the identification and critical examination of major decision alternatives, creativity in decision-making tasks, and performance gains (Watson et al. 1993; Jackson et al. 1995). In this perspective, the presence of female directors, as minority group, may contribute to board decision-making process by providing alternative perspectives and prompting divergent thinking among the majority group (Torchia et al. 2011). However, women could play a crucial role in making diversified boards more effective and contributing to better decision-making processes, depending on the board ability to tap available knowledge and skills and to guarantee active participation of all members in bringing their perspectives to the group debate (Buonocore et al. 2017; Huse 2007).

## Gender Stereotypes in Boards' Processes

Dysfunctions in board decision-making processes may depend on the existence of gender stereotypes that hinder the effective participation of women in decision-making processes. Although the workforce is increasingly becoming diversified, male attributes, such as competitiveness, dominance, and aggressiveness, are still considered crucial for enhancing managerial career success. Traditional gender stereotypes refer to beliefs that women are less able than their male colleagues for top, executive, and non-executive managerial positions, because they do not have masculine characteristics that are traditionally associated to effective and successful managers (Powell et al. 2002). As a consequence, women are considered as less effective leaders even if they behave in exactly the same manner as men.

Gender stereotypes have a significant impact on the majority group represented by male directors, who tend to consider their female colleagues as less effective in the role of directors, to distrust their judgment and expertise, and marginalize them adopting discriminating behavior, with negative consequences on the board ability to cooperate and combine their contributions in creative

and synergistic ways. For example, some scholars argue that individual differences in communication behaviors might determine much of the subtle bias against women. Indeed, women tend to show more socioemotional communication behaviors, compared to men who seem more dominant and assertive (Wood and Karten 1986). Because communication behaviors are presumed to be an indicator of competence, and communication styles of women are perceived as nonstandard and unconventional, the majority group of men tends to underestimate women's capabilities excluding them from the group's activities.

The presence of gender stereotypes may produce another dysfunction in board of directors' processes due to the phenomenon of stereotype threat, which directly involves women's behavior. The stereotype threat is conceived as the "psychological experience of a person who, while engaged in a particular task, is aware of a stereotype about his or her identity group suggesting that he or she will not perform well" (Roberson and Kulik 2007, p. 26). Individuals who are members of a negative stereotyped group fear to be seen and judged according to a negative stereotype, especially if they are performing a type of tasks regardless of which the stereotype exists, such as women in leadership positions are familiar with the common stereotype that "women are not good leaders." This awareness creates anxiety and apprehension in individuals exposed to stereotypes with a disruptive effect on their performance, ironically resulting in individual confirming the stereotype he/she wants to disconfirms (Roberson and Kulik 2007).

One of the most interesting issues concerns the application of the stereotype threat theory to explain women's behavior when they operate as a minority group in a board of directors. Task difficulty, personal task investment, and characteristics of the context are identified in research as relevant variables making workers vulnerable to stereotype threat (Roberson and Kulik 2007). Individuals involved in difficult challenging tasks and feeling personally invested in their job tend to really care about their performance and to experience anxiety and apprehension in their tasks, exposing themselves to stereotype threat. An additional condition needed for stereotype threat to emerge is the context, where some individuals are considered different from others on a salient demographic dimension, race, sex, or age (Kanter 1977).

In this perspective, boards of directors provide a fertile ground for women's stereotype threat, with relevant consequences on board processes. First, women directors are involved in complex and challenging tasks that require concentration and cognitive resources (Freidson 1988); thus they are likely to experience frustration with task accomplishment. Second, given the prestige of the role, women directors tend to experience a high level of psychological engagement and job identification, believing that doing well in the task domain is important for their self-esteem and identity. Third, despite the women improvements due to the multiplicity of regulatory acts in the last decades, there is still a small minority of women in board of directors, who are labeled as "tokens." Because of their high visibility, women feel a high pressure in performing, which creates anxiety and apprehension in making tasks, needed conditions for stereotype threat.

## The Role of Personal Networks for Accessing to Board Positions

The boards of directors in Italian public companies are composed of executive directors, such as the CEO and large shareholders, and non-executives or outside directors, who generally represent the majority of the board. Non-executive directors cannot have personal ties to the company or to anyone with ties to the company, because of their main tasks to provide protection to stakeholders by guaranteeing objectivity and independence of judgement to control the insiders but also to enhance heterogeneity of point of views and debate among the different members of the board (Corbetta and Minichilli 2006).

Public organizations generally engage in public board director individuals who hold top

positions in other large corporations, such as retired CEOs, in order to give clear signals to the community that the top managerial positions are headed by reputable people, specialized in easily attracting and managing resources (Korn and Ferry 2000).

The main improvements for women at board level, following the government acts of the last decades, include non-executive positions, while the proportion of women among executive directors is still very low. Focusing the attention on public sector in Italy, data show that in 2012 women public sector leaders compared to the 64.7% of women across total public sector represent the 27%; also, the 17% of women are in Italian ministerial positions against the 22% of the total of women in parliament (EYGM Report 2013). In the last years, this percentage is growing thanks to the recent reforms about gender discrimination act (the gender quota act), allowing Italy to be ranked in fourth position in terms of total percentage of women across the public sector (27%) and in seventh position among the G20 countries with the 27% index of women as public sector leaders (EYGM Report 2013), but despite this growth of women at top positions in public organizations, their presence is still limited for several reasons, such as the recruitment criteria mainly depending on personal opinions of majority groups.

Indeed, the recruitment of candidates is generally based on personal opinions of the chairman of the board of directors or nominating committee, who tend to select candidates drawing on their personal connections. Thus, people may access to board seats for large and prestigious Italian companies thanks to their informal network connections, while limited network relationships reduce this opportunity, because of restricted information and difficulty in finding a sponsor. Personal recommendation and networking encourage the tendency to select people who are similar to them, mainly represented by male members.

Researchers have emphasized the benefits of informal networks for individuals in the organizational hiring processes, explaining that managers tend to target their recruitment choices on the basis of whom they know personally or who share their loyalties and personal values (Galaskiewicz and Shatin 1981). Homophily is the concept used to describe the degree of interaction among individuals who are similar in identity or organizational group affiliations (Marsden 1988). Interpersonal similarities produce common interests and worldviews, which increase easy communication, improve predictability of behavior, and foster relationships of trust and reciprocity (Kanter 1977). This explains the arising of spontaneous ties based on interpersonal attraction (Marsden 1988; McPherson and Smith-Lovin 1987), leading to create or reinforce informal network relationships. Scholars explain that, under conditions of environmental turbulence and organizational uncertainty, individuals are more likely to pursue these networking strategies, which allow assuming more defensive behaviors (Ibarra 1993). In fact, they tend to attract individuals of their informal networks, because trust and loyalty in these relationships ensure reliability under conditions of uncertainty (Kanter 1977).

According to this perspective, the changes following the equal opportunity laws for board of directors tend to distort the traditional power relations creating uncertainty and concern among the members of overrepresented groups, who fear losing their traditional position of power. These concerns tend to favor the recruitment of women directors who are already known and have personal ties with the CEO or the group of shareholders, so to ensure trustful relationships and loyalty and avoid contrasting opinions in board decision-making processes. As a consequence, competences and professional expertise are not a condition for women to be appointed as a director; they often do not offer a real professional expertise that makes difficult for them to guarantee an active participation to a board debate and provide an effective contribution to group's problems. Moreover, the absence of autonomy from the overrepresented groups creates conformism among board members because women do not bring divergent perspectives from the higher-status men, and this can hinder effective group decision-making processes.

## Concluding Remarks

During the last two decades, most studies in the literature focused on diversity tend to underline the difficulties faced by women in ranking very top management levels within organizations, which remain still mainly dominated by men especially in public organizations. Despite the increasing attention paid by scholars to the structural barriers for women to access to very top positions within organizations, still limited studies investigate the reasons and limits faced by women in being members within boards of directors.

Indeed, the female representation in corporate boards within public organizations, specifically local administrations and state-owned companies, is very low, depending on environmental, political, social, and cultural factors related to each country. More specifically this underrepresentation of women in decision-making processes and positions stems from traditional gender roles and stereotypes, the lack of support for women to balance care responsibilities with work, and the prevalent political and corporate cultures (Sheridan 2001; Zona and Zattoni 2007; European Commission 2017). Also, women perceive to be discriminated in public corporate boards, and, consequently, numbers about women in public corporate boards still follow an inverse direction showing an alarming female discrimination.

This study aims to "open the mind" in public organizations, in order to think about and evidence how the group dynamics affect the concrete participation of women to decision-making processes of boards. Indeed, because of the existing gender stereotype threat in board processes, many dysfunctions still characterize the boards' decision-making processes by hindering the effective participation of women. Being part of gender majority groups plays a crucial role in being actually involved in decision-making processes of boards, because of the impact derived from the personal networks. Male directors tend to create a closed network, where personal interactions tend to support mostly men in accessing to board positions.

This analysis mainly outlines the limitations of gender quotas laws and interventions and, consequently, the need to introduce some initiatives, like diversity training programs, for creating and developing a different way to see women at workplace in top managerial positions, overcoming any gender stereotypes, and, at the same time, for trying to formalize personal connections going beyond the gender discrimination. All the organizations, especially public organizations, receive many benefits in having an increasing cross-gender workforce, especially at top positions in the boards of directors, but they also need to promote training and educating initiatives for both, men and women, at leadership positions for involving women in being "role models," becoming positive examples for all females at workplace, and, creating, in the future, "successful personal networks" for women by promoting their access to board positions.

Gender equality; Gender policy; State feminism; Woman question

## Introduction: Gender Discourse in Public Administration

The main goals of gender policy are elimination of gender-based discrimination and establishment of egalitarian society founded on the principle of equality for all people. National gender and development strategies as well as integrated approaches toward promotion of gender equality have been implemented in recent years in most countries. Evolution of approaches toward gender equality can also be witnessed in international documents as well as economic and social programs.

In the 1990s, the legal framework for gender equality was already conceived and reflected in resolutions of international conferences such as the Women's U.N. Conference in Nairobi (1985) and the Fourth World Conference on

Women in Beijing (1995). The Beijing Declaration and Platform for action is the most comprehensive legal document providing recommendations for promotion of gender equality. Among the International Labor Organization (the U.N.) conventions, the most notable are the United Nations Convention on the "Elimination of All Forms of Discrimination against Women" (a.k.a. CEDAW, 1979) and the Convention №156 concerning "Equal Opportunities and Equal Treatment for Men and Women Workers: Workers with Family Responsibilities" (1998).

What is more, a number of documents promoting gender equality underlie gender and development strategies of international organizations, as well as of different countries and regions. A clear example is the "Recommendation of Gender mainstreaming" by Council of Europe, published in 1998.

At present, elimination of gender inequality in education and deficit of women's parliamentary representation are major concerns for the entire global community. Gender-related research with in-depth view of status roles of men and women in societies at different stages of development has now become particularly topical. However, considering all the imperfections in the policy toward women, it is possible to say that the twentieth century allowed, for instance, the Soviet and now Russian women to obtain political rights, as well as participate in policy-making and influence political decisions.

## Gender Issues in Historical Perspective

The idea of "natural destiny/vocation of genders," which divided social roles between men and women, has been common for many years. This idea also underlies the patriarchal model, according to which family is primary for a woman, while other aspects of life are secondary and are not that important for her self-actualization. As for men, their social role includes working outside the house and taking care of financial security of the family. According to many researchers, such division of roles was historically established due to women's childbearing capacity.

This traditional approach has existed for many years, explaining the absence of women's labor market. Later on, a number of new theoretical concepts explained gender-based division of labor from the point of view of economic rationality. The concepts are based on the idea of opportunity costs. According to it, each spouse should perform work that provides the highest rate of return. If a woman is considered to be more productive and effective in dealing with household tasks and if she is paid less than a man in the labor market, then it is more rational for her to choose family and household as her priorities (Mal'tseva and Roshchin 2007). In fact, nowadays in many countries, this traditional model is confronted by the idea of gender equality.

In Russia, a shift to gender equality occurred during the Soviet period. First of all, it brought changes to the constitutional order. Thus, the principle of equality between men and women was anchored in legal norms since the very first Constitution of the USSR in 1918. The Russian Soviet Constitution safeguarded civil and socioeconomic rights for women. Secondly, from economic perspective, industrialization demanded extra labor force, which could be enriched by female employees. The "New Soviet woman" was legally independent; she had civil rights and was paid equally (to men) for equal work. To establish this new concept in the USSR, the term "working mother" was introduced. The "working mother" would create both material and demographic (population) recourses for her country. In other words, a woman had to learn how to combine work and family responsibilities. As a result, over 70 years of the Soviet power gender equality had become a political slogan.

However, a general "patriarchic" idea, as well as some gender stereotypes about the place and the role of a woman and a man in economic life of the country, still remained in people's minds. Furthermore, the constitutional norms about gender equality were not always respected. Equality was formal rather than real and hidden discrimination existed (Pushkareva 2008). In particular, in public administration, there were almost no women in high-rank positions. Women's representation in

government offices was also minimal. For example, A. Kolontai was the only woman in the first Soviet Government of 1917–1922. Similarly, only two women were included in the USSR Council of Ministers during the period of its existence (1923–1991). However, there was also a bureaucratic system of quotas for the nomination of women within the framework of the administrative command system of management. The proportion of women among the deputies of the Supreme Council of the USSR was set at 30%. For example, in the elections to the Supreme Council of 1984, 492 women were elected of the total number of deputies, which amounted to 33%.

Given the patriarchal way of life, which in many respects was reproduced in the Soviet period, not many women strive for a career in public administration. However, those who aspired had the opportunity to break through. Soviet power also gave women self-actualization through communist party organizations: they ran for office and were elected to the local party's chapter. Taking into consideration that there was a one-party system in the country, women tangential became participants in the political process.

During the Thaw of 1960–1970, women's organizations were widely spread, and women of various income levels and social strata were accepted: from milkmaids to pop stars. Such organizations served not only as interest clubs but allowed for a variety of types of mutual assistance to their participants. Later in the 1990s, due to political and economic changes, some of those organizations started to transform into NGOs as a result of the difficult situation (lots of women lost their work places, most of previously promised social guarantees were abolished, etc.). All this has led to the fact that many nonprofit organizations have become politicized.

Nevertheless, some legislative attempts to develop gender equality were later carried out in Russia. The first legislative action in 1993 was a presidential decree on "the priorities of the state policy on women." That document officially confirmed the importance of provision of conditions for women's participation in the activities of state bodies. Another step toward women's participation in public administration was a presidential decree of 1996 on "strengthening the role of women in the federal public authorities and in public authorities of the entities of the Russian Federation." The main goal of those regulations was an implementation of the constitutional principle of equal rights and equal opportunities for men and women. Most importantly, due to those regulations, the official gender statistics, which provided an estimate of the ratio of men and women in public service, was introduced. However, that was the only positive outcome. This brief historical reference demonstrates that women never outnumbered men in high-ranking positions of public service in Russia. The situation has not changed much by now.

Returning to the issue and current status of gender inequality in public service, it should be noted that in spite of the general trend of feminization in public civil service in Russia, the level of women's representation in senior positions still remains relatively low, similar to the ratios in the Soviet time. Standard stereotypes and employers' gender preferences in certain jobs and positions partially explain the existing trend. For instance, women in general should not qualify for management positions. Moreover, women are prone to do more work and less prone to lay claim to a high share of the income. These common stereotypes based on the idea of "natural" differences between men and women reinforce gender inequality. Government service is not an exception and is directly affected by all the aforementioned stereotypes.

Two other groups of stereotypes can explain the existing situation with the higher ratio of men over women in senior positions in public service. The first group consists of discriminating stereotypes of employers, who might think that female employees are less efficient and that they make less labor effort. The reason for this way of thinking is the fact that female employees might have more family obligations, which can interfere with their work.

The second group is represented by the behavioral stereotypes, which are typical concerning female employees. Particularly when being flouted, women often tend to compare themselves

with less competitive employees, which devalue their own achievements.

Thus, still existing in the society, "natural female and male norms of behavior" influence the formation of personnel structure in public service. According to these norms, men are considered to be more active, confident, and persistent leaders. This perception lets men more easily fit into the "status and role system of gender relations of the government service." As a result, men still prevail in superior positions of public administration in Russia. However, Russian women have been increasingly taking on many roles that were previously considered just for men such as top management executives, political figures, or simply bread winners, but females have been increasingly adding more stress on themselves through multitasking at home and professional roles (Nguyen et al. 2014).

## Gender Aspects in Public Administration

Compared to Weber's model of bureaucracy, New Public Management (NPM) model offers women a more important role in politics. Thus, considering changes in public administration in Sweden and England, the scholars argue that the NPM reform processes in these countries were heavily affected by women's movements (Barry et al. 2007). Addressing special features of the NPM, these movements managed to influence the countries' policies and promote gender equity.

Meanwhile, more flexible work conditions and changes in management instructions can be traced in the actions of the Norwegian authorities: traditionally, masculine gendering of management was replaced by more neutral gendering. Gender inequality in management in Norway found appearance of new forms of organizational procedures. The scholar mentions that a transformation to the NPM was accompanied by the emergence of the notion of "state feminists" (the term was introduced by Herness H. in 1987), i.e., female public servants who actively support a policy of gender equality and try to establish it in public institutions.

Consequently, it can be argued that in the age of the new public management, women's representation in public offices is increasing (Eisenmann and Thomas 2002). However, women had not managed to spread the idea of essential elimination of gender inequality widely enough. They also had not introduced radical changes to rigid bureaucracy of their workplaces (Isupova and Utkina 2016). After appearing on the political agenda for a while, the gender equality issue quickly became secondary to other political concerns. Scholars explored gender segregation by evaluating women's representation in public sectors of different countries. They also viewed the notion of gender at two levels. The first level is about vertical segregation, i.e., a promotion of officials within the civil service. The second level is represented by horizontal segregation, which means assigning men and women to similar positions.

## Gender and Good Governance

Thus, it is possible to consider gender issues in the framework of public-state management/partnership (Groverman 2005). The elimination of gender inequality in public service is a long and multistage process. Firstly, it requires articulating a vision of the gender issue. It is necessary to set a long-term target of solving the problem and to analyze the situation. Secondly, based on the analysis, a concrete plan of the legislation and on social perception improvement has to be developed. Importantly, a position of the gender issue in Good Governance concepts should be taken into account. Finally, it is recommended to implement measures that will contribute to an increase of women's representation in decision-making, as well as elimination of gender inequality.

Sufficient representation of women in public office and in decision-making is a crucial point in the issue of equal opportunities and human rights. In (some) developed countries, women have equal access to public office on par with men nowadays. However, it is questionable whether all women in the political life of the society want to promote gender asymmetry elimination. It is quite possible that some of them, like men, accept the existing

situation. Therefore, direct relevance of gender equality to female civil servants problem will be one of the main mechanisms for the formulation and the implementation of new legislation that would solve the problems. The legislation would include such aspects as development and promotion of female associations and committees, more detailed in-depth view on existing gaps in legal status of a woman, support of women's interests, and better addressing their needs.

Based on the main principles of the Good Governance theory, it considers women's participation in resolving a problem of gender inequality (Brush 2003):

- *Gender and a public sector reform* (administrative reform). The proposal implies that introduction of results-based management, performance indicators, new incentives, staff selection, and reporting systems as well as of new educational and promotion policies will help achieve gender equality. Importantly, understanding of the term "government service" helps to see how government authorities contribute to or undermine the principle of gender equality.
- *Gender, responsibility, and anticorruption measures*. Establishment of new accountability and oversight institutions, setting up of human rights and gender equality commissions. A need for more transparent government control of anticorruption measures is also emphasized. The civil society, including women, will participate in this mechanism.
- *The rule of law*. The new legislation, which would more effectively regulate and suppress situations of women's discrimination, should be developed.
- *Decentralization* emphasizes that it is important to raise the voice of women at the local government level.

## Contemporary Gender Policy in Russia

Nowadays, terms "gender policy" and "gender equality policy" are accepted in Russian official documents. Their adoption happened due to the "second-wave feminism," which raised the issue of women's discrimination and initiated reflection on the relationship between two big social groups, namely men and women, in the context of human rights.

The Convention on the "Elimination of All Forms of Discrimination against Women" (CEDAW) of 1979 became the so-called "Women's Bill" of Rights. It was the first document, which provided a definition of discrimination against women: "any distinction, exclusion or restriction made on the basis of sex which has the effect or purpose of impairing or nullifying the recognition, enjoyment or exercise by women, irrespective of their marital status, on a basis of equality of men and women, of human rights and fundamental freedoms in the political, economic, social, cultural, civil or any other field".

The USSR was among the first countries that ratified the Convention. The ratification occurred with hardly any discussion and reflection on the core provisions. As a result, the work to implement the major statements had never begun. Studies on women's social problems were rarely carried out, and their outcomes were known in advance. However, it is noteworthy that some researchers documented, for example, the problem of the "double burden" of women, which was perceived/assessed as a nonadversarial contradiction of socialism. USSR pursued its own special policy with regards to women, which, from the state's perspective, would enable it to deal with the "women's issue."

Quite a lot has been written about the gender policy. A historic approach is most often used and it distinguishes "state policy with regard to women" and "gender policy." Under this approach, the following types of gender policy with regards to women are identified:

- a *patriarchal* approach (a.k.a. "traditional"), when the State acts in accordance with traditional attitudes of a patriarchal gender order,
- a (historically) more recent *paternalistic* approach, conducted as a policy "to assist women" though protectionism or paternalism,
- a *liberal* approach (a.k.a. "gender policy"), based on livelihood provided by both genders. This approach considers more actors, as it is

G

guided by market rules to a large degree. It includes not only the State, but also private sector and civil society organizations.

It is hard to say unequivocally which policy is being pursued today in the Russian Federation. Following the Conference in Beijing, Russia has taken several steps to demonstrate its commitment to the letter and the spirit of the Beijing Declaration and Platform for action. However, at the AWID International Forum "Beyond Beijing From Words to Action," it was pointed out that the Government had not taken adequate action to provide resources for the Concept of "strengthening of the role of women in the Russian Federation" (1996) and for the National Action Plan (1996–2000).

In the first years after the Beijing Conference, Russian national gender equality mechanism included executive and legislative branches (features) of government. A roundtable of women's nongovernmental organizations was operating under the auspices of Ministry of Labor and Social Affairs. In other words, the national gender equality mechanism generally was consistent with the letter and the spirit of UN documents. From the experts' perspective, it was strong enough to conduct national gender policy.

Later the situation was reversed. In 2002, the Presidential Commission on Women, Children, and Demography (population) was eliminated, the second National Plan for the Advancement of Women was not implemented, and the next one was not adopted, as well as the "Gender Strategy of the Russian Federation" (Federal Act on State Guarantees of Equal Rights and Liberties of Men and Women in the Russian Federation and Equal Opportunities for their Realization).

At present, almost all real advances in implementation of modern gender policy have been abolished.

The old government policy relating to women is a general trend for resolving gender problems by today's government. The "Conception of a demographic policy of the Russian Federation for the period to 2025" (2007) and a more hardline approach to abortion rules government bill devoted to the changes to be made in the Federal Act on Basic Guarantees of the Rights of the Children in the Russian Federation (2011) support this conclusion.

What is happening now is an emulation of (the imitation) the Soviet family model, where a woman is responsible for the upbringing and education of children. The legislation against abortion continues this trend. Simplified understanding of the national population policy and unsuccessful methods of exerting pressure on women suggest forgetting about the gender equality policy. It is well known that gender and population policies weaken each other if solutions to demographic problems increase gender inequality. This is precisely what's happening now.

As during the Soviet times, modern political authorities are too technical (formal) in approaching the issue of gender equality and do not manifest a political will for resolving it.

On the one hand, government authorities are trying to resuscitate the "natural" male and female social roles and to idealize traditional power relations in the family and society. On the other hand, there are actors in the society that promote gender policy. The middle class and the young support this policy.

The trend toward empowerment of women including their enhanced opportunities to be elected as President or Prime Minister is gradually becoming a symbol of our time. All developed states are moving toward new and modernized functions of the government. This shift is due to the increase in requirements of the society for the quality of life and the transition to a new level of development particularly in gender equality. However, in modern Russian history, so far only one woman ran for the presidency of the Russian Federation – in 2004, Irina Hakamada gained 3.84% of the vote.

## Conclusion and Discussion

The general trend is set by the federal government of Russia in addressing gender problems of society – the old track "State policy in relation to women." This conclusion is confirmed by the

"Concept of the Russian Federation population policy for the period up to 2025" (2007) and the draft law "On Amending the Federal Law "On Basic Guarantees of Child Rights in the Russian Federation"" (2011) that would tighten rules for abortion. The bill is a gross invasion in privacy of citizens for the purpose of increasing the birth rate on the national level.

However, on March 8, 2017, "National Action Strategy in the interests of women in the years 2017–2022" prepared by Ministry of Labor and Social Protection of the Russian Federation under the instruction of Russian President and the Government was signed by Prime Minister of the Russian Federation. The strategy acts like a fundamental document defining the priority directions of the state policy for women in the medium term. It spelled out the tools that will ensure the effectiveness of the involvement of women in the economy, and increase their representation at various levels of decision-making, as well as measures to fight stereotypes against women.

To date, the problem of achieving gender equality of women and men in politics is one of the priorities in the political development in many countries. Events of modern political history and theoretical basis of important "female" transformations in contemporary politics are of great scientific interest that goes far beyond a single state. There is an objective need to explore previously unclaimed women's political potential in identifying internal and external factors affecting women's political participation and shaping it as an active subject of political activity.

## Synonyms

Gender-responsive budget; Gender-sensitive budget; Women's budget

## Definition

Gender Budgeting provides approaches and tools for introducing gender perspectives into the budgetary process. It assists decision-makers who are involved in the allocation of public resources in *uncovering* and *utilizing* the different effects that a budget can have on women and men, i.e., analyze and revise public revenues and

public expenditures with the aim to promote gender equality.

## Gender Budgeting: An Overview of the Concept

Gender equality and the empowerment of women have been long debated in public policy, not least due to the socioeconomic challenges tailing the two (e.g., employment, education, fertility/demographic development). Governments across the globe have therefore increasingly aimed at introducing gender perspectives in their decision-making – for example, by uncovering how public policies and ways of delivering public services may affect women and men differently and by designing policies and programs to mitigate or alleviate possibly arising gender inequalities. In this context, a government's budget may be regarded as a key instrument mirroring policy priorities as well as shaping administrative actions by controlling and evaluating the sources and the use of (financial) resources (see, e.g., Lee et al. 2013). At first sight, the budget merely reflects the source, the type, and the volume of public revenues and the type and the volume of public expenditures and therefore has often been considered as "gender-neutral." However, the way in which public funds are raised and spent has a different direct and indirect effect on different citizen groups and hence also on women and men. Neglecting the latter in the design of public budgeting systems and in the preparation of government budgets (on different governmental levels) means carrying forward economic disparities and traditional gender roles in society. As such, budgets that do not purposely take into account living conditions of women and men cannot be considered as gender-neutral but rather as "gender blind" (Elson 1998).

This proposition may also explain the general impression that Gender Budgeting is mainly associated with specific documents, e.g., the gender-responsive budget, women's budget, and gender-sensitive budget which in different country contexts (and as such in different budgetary systems) may look differently or contain specific details, but tap into the same general notion of a budget that incorporates gender perspectives. Gender Budgeting however encompasses not only "the budget" but a range of tools and instruments that assist (political as well as administrative) decision-makers in analyzing and revising public revenues and public expenditures to address gender gaps and inequalities. In other words, Gender Budgeting provides approaches and tools for *uncovering* and *utilizing* the different effects that a budget can have on women and men with the aim to promote gender equality (see also Directorate General of Human Rights 2005; Sarraf 2003).

Gender Budgeting has been developed as an initiative of introducing *women's budgets* in the federal government in Australia in the 1980s (Sharp and Broomhill 2002). The concept gained momentum with the World Conference on Women in Beijing in 1995 (e.g., Stotsky 2016). In developed countries, it has mainly been supported by feminist economics, a field that has pushed toward overcoming gender-blind economic theories and policies, as well as by the women's and feminist movement that advocated for integrating gender perspectives into fiscal and financial policies. In developing countries, international organizations like the IMF, OECD, or UN set requirements to promote gender equality alongside more general budgeting and accounting reforms in exchange for international capital (see Holvoet 2007). Today, reports show that a majority (90%) of OECD countries have at least initiated if not fully implemented Gender Budgeting to promote gender equality (Downes et al. 2016).

Still, Gender Budgeting initiatives differ substantially across countries and governmental levels (Fragoso and Enríquez 2016; Kolovich and Shibuya 2016; Stotsky 2016). Over the last years, the IMF published the results of several surveys on Gender Budgeting efforts in different countries and regions around the world – in Asia (Chakraborty 2016), Europe (Quinn 2016), the Middle East and Central Asia (Kolovich and Shibuya 2016), and sub-Saharan Africa (Stotsky et al. 2016), as well as in the Western Hemisphere more generally (Fragoso and Enríquez 2016). These reports show that countries in the Americas,

e.g., Brazil, Chile, Mexico, and Peru, have approached Gender Budgeting rather peripherally, and mainly in the course of implementing performance-oriented or participatory budgeting reforms. European countries, e.g., Austria, Belgium, and Spain, in contrast, have implemented more progressed forms of Gender Budgeting (Stotsky 2016; Quinn 2016). The latter may be a result of the EU Commission highlighting the concept of Gender Budgeting as a means toward achieving gender equality and increasing the overall welfare of EU member states in 1999 (see Mayrhuber et al. 2007, p. 49).

## Aims, Purpose, and Benefits of Gender Budgeting

In a general sense, Gender Budgeting aims to assist decision-makers in "tak[ing] a gender perspective in all areas of budgetary policy" (Mayrhuber et al. 2007, p. 49) and in the "reprioritization of both expenditures and revenue-raising methods in order to promote social justice" (Cagatay et al. 2000, p. 14). In practice, this means that actors involved in public budgeting engage in a discourse about priorities in the distribution of public expenditures and of the burden in raising public revenues in light of striving for gender (or social) equality. Depending on the country context, Gender Budgeting may be implemented with different aims: in some countries it may be seen as a means to achieving legal equality between women and men, whereas in other countries (which have already achieved legal equality), it may be rather used to achieve social and economic equality in society, e.g., by making visible parts of the economy that often are excluded from macroeconomic figures given that they come from unpaid work (e.g., child care, elderly care for relatives, household work) which is still predominantly attributed to the social role of women (Mayrhuber et al. 2007, p. 49).

In addition to the aforementioned goals, Gender Budgeting may help in increasing accountability and mitigating corruption, as budgets become more transparent (Budlender and Hewitt 2003). The concept bears also the potential to increasing the quality, efficiency, and effectiveness of public sector organizations, as it questions existing structures and processes in administrations and may assist in preventing wasting resources by introducing an output- and outcome-oriented approach to resource allocation (see Jauk and Kronberger 2012) (in this case, e.g., balanced distribution of financial support for women and men, reducing the discrimination of women, supporting an independent livelihood of women). Gender Budgeting therefore may not only be considered useful in achieving gender-related equality. The considerations behind the concept may also be translated to achieving equality for, e.g., the elderly, people with migration background, or people with disabilities or special needs (Jauk and Kronberger 2012). As such, Gender Budgeting may support approaches to performance-oriented budgeting in general. In contrast however, prior experience in practice suggests that Gender Budgeting may be easier to implement in governments where performance-oriented budgeting has already been designed and implemented (see Holvoet 2007; Sharp 2003).

## Typology of Gender Budgeting Initiatives

Gender Budgeting initiatives, activities, and tools vary widely across different countries and administrative levels. Although, in general, scholarly work on Gender Budgeting is rather scarce and information about the diffusion of the concept and distinct approaches to as well as the level of its implementation mainly come from single-case or comparative case studies by the UN, the OECD, and the IMF (see also above), there exist criteria that allow a comparison of the different approaches and content of Gender Budgeting initiatives (Table 1).

The table shows that Gender Budgeting initiatives can be located inside or outside the governments, but can also connect government with international organizations, civil society organizations, or citizens (*political location and actors*). While some initiatives focus solely on gender equality, others include multiple themes, including health and environment. Gender Budgeting

**Gender Budgeting, Table 1** Typology of Gender Budgeting initiatives; see Holvoet (2007) and Bamanyaki (2016)

| Criteria | Features |
|---|---|
| Political location and actors | Inside government:<br>Executive arm of government<br>Legislative arm of government<br>Outside government:<br>Civil society, nongovernmental organizations<br>Academic institutions<br>Combined:<br>Government with international organizations<br>Government with civil society organizations<br>Government with citizens (in participatory budgeting initiatives) |
| Goals | Adhering to international commitments (gender equality)<br>Distributive justice and equity:<br>Challenging economic and social policies and macroeconomic policy frameworks<br>Challenging and correcting for gender bias in policies, programs, and budgets<br>Efficiency and effectiveness of government policy and implementation<br>Transparency and accountability<br>Enhanced citizen participation and advocacy<br>Empowerment of specific groups (girls, women, marginalized groups)<br>Enhanced democracy and good governance |
| Focus/coverage | Themes<br>Single theme (gender, poverty)<br>Multiple themes (gender, poverty, social inequalities, health, environment, etc.)<br>Coverage<br>Entire budget (all revenues and expenditures, across sectors/entities)<br>Specific items (sectors, programs, categories of revenue and expenditure)<br>Budgetary processes |
| Phase of the budget cycle | Planning and appraisal phase (priority setting, formulation and enactment of budget)<br>Implementation and monitoring phase<br>Audit and evaluation phase |
| Approaches, processes, and tools | Approaches<br>Three-way categorization framework<br>Five-step approach<br>Budget cycle framework<br>Processes<br>Participatory<br>Technical<br>Tools<br>Gender-aware policy appraisal<br>Gender-disaggregated beneficiary assessments<br>Gender-disaggregated public expenditure incidence analysis<br>Gender-disaggregated revenue incidence analysis<br>Gender-disaggregated time use studies<br>Gender-aware medium-term expenditure framework |
| Outputs | Social impact analyses<br>Gender-aware budget statement<br>Gender-responsive budget guidelines or call circular<br>Public sector performance audit reports<br>Alternative (gender-sensitive) budgets |

can address the entire budget, i.e., all revenues and expenditures, or cover only selected items (e.g., health and education) (*goals*, *focus/coverage*). Furthermore, it may be implemented in the entire budget cycle (covering planning and appraisal, implementation and monitoring, and audit and evaluation) or only in one of the budget phases (*phase of the budget cycle*).

Sharp (2003) discusses three *approaches* to Gender Budgeting: (1) the three-way categorization

("the Sharp framework") in a first step categorizes expenditures in three types, then uses tools of gender-disaggregated expenditure analysis to assess the gender impacts of the expenditures, and subsequently develops a budget statement that includes information on gender issues and gender impacts; (2) the five-step approach ("the Budlender framework") begins with describing the situation for women and men, followed by an assessment of whether public policies address these gender issues, a check of budget allocation, a check of budget execution and service delivery, and lastly an assessment of the impact of the policy and the expenditures; (3) the budget cycle framework ("the Elson framework") examines financial inputs, activities financed, outputs delivered, and impacts on people's well-being for a selected ministry or program budget with the aim to uncover gender gaps and then integrates the results with the aim of bringing changes to budgetary and policy decisions.

From a *process* perspective, Gender Budgeting can follow a participatory process where citizens or particular interest groups are involved in the budgetary process, or a technical one. Gender Budgeting is conducted by professionals within the administration and legislature, or by experts on behalf of the latter, and thus is less focused on empowerment than on equity of budget policies and allocation (Cagatay et al. 2000). There are several *tools* that are key to the concept of Gender Budgeting. In a *gender-aware policy appraisal*, policies and programs are analyzed for their impact on gender inequalities. In a *gender-aware beneficiary assessment*, the beneficiaries of public services are asked to indicate whether (particular) public services meet their needs (e.g., via qualitative interviews or focus groups). The *gender-disaggregated expenditure incidence analysis* basically consists of an assessment of the distribution of public spending by gender. The other side of this coin is the *revenue incidence analysis* – an assessment of the manner in which governments raise revenues. *Gender-disaggregated time use studies* inform a gender-aware budget strategy by monitoring the time that women and men spend on different tasks, particularly the relation of paid and unpaid work.

The *outputs* of Gender Budgeting (the documents produced in the course of introducing gender perspectives into the budgetary process) vary depending on the approaches that are followed and the tools that are applied. The outputs may encompass social impact analyses, gender-aware budget statements, guidelines, audit reports, or alternative budgets, i.e., gender-sensitive budgets. In the general debate, gender-aware budget statements appear as the most popular aspect of Gender Budgeting. In contrast to an initial presumption that gender-aware budget statements comprise separate budgets for women and men, they rather supplement the expenditure side of the budget by gender-aware indicators, which can be used to monitor changes over time and to inform budget allocation decisions.

## Conclusion and Outlook

Gender Budgeting initiatives have played a crucial role in promoting gender equality for several decades. Gender Budgeting provides the opportunity to connect different aims of gender equality with a government's prioritization of topics and programs and the allocation of (financial) resources. Focusing on public budgeting (i.e., the process of planning and appraisal, implementation and monitoring, and audit and evaluation of the allocation of public resources), the concept of Gender Budgeting looks at how public funds are raised and distributed and how they affect women and men differently. As the public budget has an important steering and control function, Gender Budgeting can contribute to a fairer distribution of public funds and thereby contribute to equality between women and men.

Various Gender Budgeting initiatives have been implemented across countries and governmental levels, particularly in the course of designing and implementing public budgeting and accounting reforms. The present chapter presented a typology that covers different types, approaches, and tools found in practice. While Gender Budgeting has been subject to practice-oriented reports by professional bodies, it has only seldomly been the topic of scholarly research. Thus, relatively little is known about the sustainability of the concept once it has been implemented in the public budgeting process and systems.

Similarly, there exist only a few insights on effects and outcomes of integrating gender perspectives into the budgetary process, such as whether and how it fosters gender-sensitive thinking within financial ministries or the use of gender equality objectives in the administration for internal management purposes, whether and to what extent Gender Budgeting objectives are defined and controlled in legislature, and whether and how it changes political decision-making toward a more gender-sensitive debate and, in consequence, whether it achieves the overarching aims of decreasing gender gaps (e.g., social, economic, health) and increasing gender equality in general.

Crises like the global financial crisis in 2007–2009, and health crises like the currently ongoing global pandemic, substantially affect governmental resource allocation. On the one hand, they result in higher unemployment rates and a significant decrease in public revenues. On the other hand, they lead to an increased demand for public services and transfer payments like unemployment benefits or welfare. Austerity measures and budget cuts, which are often introduced in response to such crises, affect women and men differently. Budget cuts, especially in the social sector, are likely to increase gender inequalities, as women are more dependent on social services than men and thus suffer more from budget cuts. Furthermore, wage or salary reductions weaken the labor market position of women (see Addabbo et al. 2018). These events as well as an observable political trend toward a right-wing-conservative spectrum across the globe may have a negative impact on the effective implementation of Gender Budgeting in the near future, accounting for postponements or complete retraction from Gender Budgeting initiatives. The efforts of introducing gender perspectives in the budgetary process and their long-term success in the political and administrative arena will therefore depend on incentives and sanctioning mechanisms, external reviews of the achievement of goals, as well as mandatory evaluations, similar to what we have learned from the implementation of public budgeting and accounting system reforms in the past.

# Gender Differences: Male Officers' Perception Toward Women's Occupational Barriers in Federal Law Enforcement

Helen H. Yu
University of Hawai'i at Manoa, Honolulu, HI, USA

## Synonyms

Federal law enforcement; Gender differences; Gender inequality; Occupational barriers

## Definitions

Gender differences in public administration are gendered norms and practices that make clear distinctions between agentic (i.e., masculine) and communal (i.e., feminine) attributes in the workplace. Examples include both organizational and occupational elements such as employee representation, organizational culture, social rules and structure, gender bias and stereotypes, gender roles, and physical and mental differences. Occupational barriers are impediments that negatively impact women's recruitment, retention, and promotion in the workplace.

## Introduction

Since the passage of the Equal Employment Opportunity Act of 1972, the changes in employee demographics continue to make gender an important issue in public administration. For example, women's labor force participation increased from 43.9% in 1972 to 57.0% in 2017, and overall, women account for 46.9% of all working Americans (U.S. Bureau of Labor Statistics 2018). However, not all occupations have seen an increase in women's participation. Federal law enforcement is one of those occupations. According to the U.S. Bureau of Justice Statistics, women account for just 15.5% of all full-time federal law enforcement officers authorized to carry firearms and make arrests (Reaves 2012). Although women have worked in federal law enforcement for almost 50 years, the scholarship on their experiences – aside from local and state local law enforcement – has only grown in recent years. This chapter focuses on women's occupational barriers in federal law enforcement and highlights gender differences, specifically male officers' perceptions, to those challenges women face in the workplace.

## Background

### Gendered Norms and Practices in Law Enforcement

Although women have made great progress in policing, the public continues to view law enforcement as a heavily male profession, creating gender stereotypes of occupational roles that are not useful for women in policing (Wells and Alt 2005). For example, women tend not to possess agentic (i.e., masculine) traits that are valued in policing such as objectivity, aggressiveness,

bravery, suspicion, and strength required to fight crime and apprehend individuals (Miller 1999), but rather communal (i.e., feminine) traits that are disregarded but perhaps better suited for today's law enforcement such as communication and conflict resolution (Swan 2016). While judicial and legislative efforts to diversify law enforcement agencies have had some success, sex-based discrimination to include sexual harassment and exclusion from certain tasks associated with masculinity is part of the daily lives of women in law enforcement (Tougas et al. 2005). Therefore, it comes as no surprise that many male officers continue to believe that women cannot handle the job physically, and they tend to view their female colleagues as emotional, untrustworthy, and in some instances, resentful toward women for advancing in the organization, highlighting the continual gender roles and stereotypes that are seen in organizations that are traditionally male dominated (Hale 1999; Martin and Jurik 2006; Rabe-Hemp 2008). This places artificial occupational barriers, both deliberate and through unconscious bias, that negatively impact the recruitment, retention, promotion, and evaluation of women in law enforcement.

## Gender Differences to Women's Occupational Barriers in Federal law Enforcement

Decades of research have shown that men and women experience workplace matters and interactions, as well as gender issues differently. Since law enforcement is a male-dominated occupation, the perceptions presumed by male federal officers provide a majority viewpoint that emphasizes stereotyping and gender roles, adversely impacting women's value and acceptance in federal policing. To illustrate, in their study on perceptions to women's occupational barriers in federal law enforcement, Yu and Rauhaus (2019) found that gender differences exist between the experiences encountered by female officers and the perception of male officers to those experiences for all occupational barriers.

First, the perception of federal law enforcement as an inclusive organization varied widely among gender (Yu and Rauhaus 2019). An overwhelming majority of male officers (92.3%) perceived an organizational culture of gender equity, whereas only 59.3% of female officers felt the same. These perceptions can be interpreted in two ways. While 40.7% of female officers perceived an unsupportive culture, lending credibility to prior research on the continued existence of the masculine culture in law enforcement (Dick and Jankowicz 2001; Franklin 2005; Hughes 2011; Paoline 2003), the latter suggests that the organizational culture in federal law enforcement is changing – albeit slowly – to reflect the diversity of modern law enforcement agencies and the communities they represent. Although federal law enforcement does not display the extreme gender prejudices as noted in many state and local law enforcement organizations (Martin and Jurik 2006; Rabe-Hemp 2008), mild traces are still visible.

Second, perceptions of negative attitudes from male colleagues and sex-based discrimination to include sexual harassment also varied widely among gender (Yu and Rauhaus 2019). Over a quarter (28.6%) of the female officers perceived experiencing pervasive negative attitudes from their male colleagues, whereas less than a fifth (18.2%) of the male officers perceived women experiencing workplace resentments by male colleagues. While the overwhelming majority (75.6%) of male officers appears supportive of their female colleagues, remnants of an organizational culture that celebrates masculine values and the belief that women cannot handle the job physically or emotionally still exist (Hale 1999; Martin and Jurik 2006; Rabe-Hemp 2008). In addition, the federal government's efforts with eliminating sexual harassment appear to be working (e.g., Notification and Federal Employee Antidiscrimination and Retaliation Act of 2002). Despite the gender disparity – 12.2% of the female officers reported experiencing sexual harassment, whereas only 3.2% of the male officers' perceived women experiencing sexual harassment – the overall trends are positive. The percentages were much higher in previous studies on women in federal law enforcement (Schulz 2009; Yu 2017). Unfortunately, the same cannot be said for sex-based discrimination. Almost a third (29.3%) of the female officers reported experiencing sexual discrimination in

regards to job assignments, training opportunities, or promotions, whereas only 4.2% of the male officers perceived women experiencing sexual discrimination. As mentioned previously, this is consistent with male officers' belief that federal law enforcement is an inclusive organization (92.3%) that promotes gender equity. As a male-dominated occupation, the disparity is not surprising since gender differences in perception are based on personal and workplace reality. Women often perceive greater sex-based discrimination in masculine agencies, and occupational barriers are often invisible to most men, since they are not exposed to them in the same manner as women (Kerr et al. 2002).

Third, a perceived glass ceiling to promotions and lack of female role models also varied widely by gender (Yu and Rauhaus 2019). Almost a third (29.8%) of the female officers perceived a glass ceiling to promotions, whereas only 19.4% of the male officers perceived a glass ceiling to promotions exist for women in federal law enforcement. The disparity is interesting because far more male officers (54.5%) had supervisory experience than the female officers (35.2%) in their study, despite both having near identical tenure at their current agency. Likewise, an overwhelming majority (75.9%) of the female officers perceived a lack of high-ranking female role models in federal law enforcement, whereas only half (51.8%) of the male officers perceived the same. The disparity is again particularly interesting because there are actually more male officers (17.8%) occupying higher grades (GS-14 and higher) than female officers (13.5%) in their study. In addition, there was not one single female in the Senior Executive Service at this organization, a recurring complaint among female officers. However, unlike the other occupational barriers discussed in this chapter, the masculine culture of law enforcement likely contributed to male officers believing there are too many female leaders due to perceived preferential or affirmative treatment.

Lastly, perceived presence of work-life balance initiatives was notable among gender (Yu and Rauhaus 2019). Almost a third (30.2%) of the female officers perceived their agency had adopted family-friendly policies in the workplace, whereas over half (51.6%) of the male officers perceived the same. The disparity is again interesting and likely as a result of those who actually utilize these types of policies and programs. Although work-life balance initiatives are available to both male and female officers, women tend to take advantage of these policies far more than men, and would notice if certain programs are offered or not (Feeney and Stritch 2017).

Occupational barriers will continue to be factor for recruiting, retaining, and promoting more women in federal law enforcement; however, recognizing the marginalization of women's occupational barriers by male colleagues should be helpful for organizations facing a similar problem propel leaders to move beyond awareness to action. Recent national and international developments have brought renewed attention on gender equality in the workforce. For example, the United Nations campaign identified as *HeForShe* believes that gender equality is not a women's issue but a human rights issue that requires equal participation and commitment from men. The campaign incites high-ranking men to accelerate the achievement of gender equality by advocating for the removal of workplace barriers that prevent women from achieving their potential. Until then, organizations cannot create the systematic and sustainable change needed to achieve gender equality. This is especially important for male-dominated occupations such as law enforcement, as men are more likely to hold executive-level management positions and can implement change. All leaders must advocate zero tolerance in regards to sex-based discrimination to include sexual harassment, as well as the old boys club mentality that adversely impact women at work and promotion boards. Eliminating even one barrier is a step toward gender equality in the workplace.

## Conclusion

Gender differences will continue to exist in federal law enforcement as long as policing is seen as a masculine occupation. However, any effort for increasing the presence of women in federal law enforcement should take the perceptions of male

officers into account to gain insight into women's mistreatment in this nontraditional occupation. Although federal law enforcement does not exhibit the extreme gender prejudices noted in many state and local law enforcement organizations (Martin and Jurik 2006; Rabe-Hemp 2008), mild remnants of a masculine culture are still visible. And since organizational cultures develop over time, creating a new culture is often met with great resistance; however, existing research suggests that the culture in federal law enforcement is changing – albeit slowly – to reflect the needs of a modern law enforcement agency and the communities they represent.

# Gender Equality in Public Procurement

S. N. Nyeck
Vulnerability and Human Condition Initiative, Emory School of Law, Atlanta, USA
Critical Studies in Higher Education, Mandela University, Port Elizabeth, South Africa

## Synonyms

Gender Equality; Gender Equity; Gender-Responsive Procurement; Governance; Public Procurement; Social Values; Vulnerability; Vulnerable Subject; Women-Owned Business

Public procurement reform has been celebrated as a "global revolution," (Arrowsmith and Davies

1998) and in many aspects it has been. The collapse of the Soviet Union in the late 1980s, and the subsequent entry of former Soviet states into the European Union, provided a regional and global momentum for the harmonization of public procurement mechanisms to ease the way government does business with the private sector. Contracting being at the heart of public procurement, it was not surprising that early conversations (1990s onward) about global reforms significantly benefitted from the contributions of legal scholars perhaps more than from any other academic field. Almost by default, global public procurement has been seen as a natural extension of governance, a term that speaks of a multi-stakeholder (Kaul and Conceição 2006) approach to public administration, a management system of rule without government (Rosenau 1992) (at least the idea of government as the sole providential provider of public goods and services). Governance, an approach that aims to capture the actual performance of public administration in the delivery of services, has also been treated as "a broad and demanding concept [that] *trumps* 'democracy,'" where the challenge is exclusively posed in terms of modeling performance through the deployment of "sophisticated quantifiable criteria" to measure outputs, not subjective inputs (Rotberg 2016). Aversion to conversations about inputs in global public procurement reform and emphasis on harmonizing mechanisms of governance only leave one wondering where, if anywhere, concerns about gender equality fit with government outsourcing schemes. Furthermore, one may query about the sorts of substantive engagement with gender equality that remains peripheral or unexplored in global public procurement reform. To take these questions seriously is to consider the concerns of governance, public procurement, and democratic reform as fundamentally intersectional and not oppositional.

To view public procurement as a governance mechanism has implications for understanding states' core financial responsibilities and capabilities as well as the trajectories that gender-based or responsive schemes take or fail to take (Nyeck 2015). Since Ronald Reagan's and Margaret Thatcher's free-market economic policies in the United States and UK, respectively, the size of government responsibilities for the direct provision of public works, goods, and services has been shrinking globally. Instead, ownership and control of resources to solve public problems are no longer exclusive to government alone or national policy. Market forces and multilateral financial institutions play key roles in shifting public responsibility and scope of intervention, especially in non-OECD countries (Organization for Economic Cooperation and Development headquartered in Paris, France). As scholars rightly note, "contracting out private solutions to externalities, private financing of public sector projects, among others, are making their way into public finance textbooks. . .governments no longer merely act as aggregators of national policy preferences and national policy is nested in the global policy framework. . .Thinking about public finance is reaching into the realm of foreign policy" (Kaul and Conceição 2006, 3–4).

Concerns about gender equality naturally arise when one takes into account the economic, social, and political objectives of public policy. While there is virtue in measurement, not everything is measured or can be measured in public policy. One can never properly measure what is not counted in the first place (Perez Criado 2019), or that which is distorted in the process of data presentation (Nobel Umoja 2018). Moreover, counting (in public policy) is always political (Stone 2001) (meaning it reflects power disparity in society). Fruitful conversations about gender equality are therefore not served by a one-sided narrative about exclusion or inclusion. Rather they benefit from a critical reappraisal of the very terms of both gender inclusion and exclusion (Mastracci and Bowman 2013).

Social and economic disparities between men and women are not restricted to one country. However, the global trend has been to interpret gender equality within public procurement first as a call for inclusion on the supply side only, targeting women-led or women-owned enterprises through various preferential schemes and quotas. This business focus is timely and extremely important because while global public procurement is a trillion dollars market, it is

estimated that women-owned businesses only capture 1% of economic opportunities (International Trade Centre 2014). Accounting for this realization, multilateral, transnational, and regional initiatives have been put in place to make public procurement promote women's entrepreneurship. (See, for instance, African Development Bank Group's Affirmative Finance Action for Women in Africa, AFAWA, https://bit.ly/37zOSkd and partnership with UN Women to improve gender statistics https://bit.ly/2UWkfCT. Another example is the Inter-American Development Bank committed to supplier diversity in its own procurement process, https://bit.ly/2Sx1Drj. Accessed February 2020). UN Women, for instance, has launched a global campaign to reform the UN procurement system for this end (UN Women 2020) and actively supports gender-responsive initiatives across the globe (the biannual Women's Economic Empowerment Global Summit (WEEGS) that takes place in Sarjah, United Emirates Arabs, is an example of collaboration between UN Women and Nama Women Advancement Establishment (NAMA) to ground gender-responsive procurement solidly within the framework of 2030 Sustainable Development Goals. https://namawomen.ae/. Accessed February 2020). In Africa, several countries have explicitly incorporated gender-responsive thresholds in national public procurement legislations. Zambia, South Africa, Kenya, Uganda Rwanda are sample countries that have committed to increasing the number of women vendors in public procurement (see https://bit.ly/2wolwZd. Accessed February 2020).

Clearly, the supply side needs more transformation and representation if commitment to gender inclusion and responsiveness is to be impactful in global public procurement reform. It is, however, argued here that gender inclusion that does not simultaneously take seriously the consumer side splits gender constituency and allegiances (Nyeck 2017). Gender-responsive public procurement should therefore be wary of one-sided empowerment schemes that remain unresponsive to the problems encountered by women consumers who also bear the cost of publicly procured goods and services. This concern is crucial in all development schemes that should strive to increase the number of women-owned enterprises as suppliers in public procurement as well as the *quality* of essential goods and services important to women and men as consumers and taxpayers. In considering the vulnerability of women as vendors and consumers, a comprehensive picture of demands for institutional reform emerges. At the center of this picture is a responsive and responsible state committed to linking and protecting equality inputs and equity outputs in public procurement schemes.

Rather than limiting inquiry on the institutions and rules that govern the control of resources as well as their allocation, concerns about gender equity bring intersectionally and relationally social and economic inputs and outputs in public procurement. In fact, gender is everywhere because it supplies, finances, and consumes publicly procured goods and services. This is not to downplay the tremendous efforts (above-mentioned) undertaken to ensure that public and private businesses give women their *fair* and *potential* share in the public economy. These efforts are laudable and profoundly transformative. The point here is to steer current thinking and practices in directions that embrace far more comprehensive gender-responsive-responsible frames in public procurement thereby ensuring no harm is done on/to the supply or consumer side. While gender equality tends to "equalize opportunity" in the treatment of men and women (and other genders where legislation permits) in public policy, the term "equity" suggests equality alone is not enough.

Critics of equal opportunity between sexes and genders as the basis for public policy often note that the model neither accounts for systemic discriminations nor the specific historical agencies deployed to rectify unequal treatment between men and women in society. Clearly, the debate about the equity-equality dilemma remains controversial, and some think it is "debatable whether we can have 'equity' and 'equality' in a society that prioritizes efficiency in resource management over social justice" (Espinoza 2007). Here, in

setting up the tension between social justice and management as a zero-sum game, ideology often trumps empirics. What then has emerged from the strong opposition between on the one hand equality and equity, and managerial concerns on the other hand, is "unilateral efficiency," a presumptive halo of entrepreneurial virtue preassigned to the private sector and denied to the public sector as *the* point of departure for conversations about public procurement reform. This ideological underbelly of global policy tends to fixate conversations about gender as either irrelevant or diminishing the quality of managerial expectation or as "added value" only to the extent that value is justification of equal treatment. Either way, gender is not taken seriously on its own terms (Amadi 2015) and where it is accounted for, it is often linked to different agendas that tame the demand for social justice or the recognition of the engineering and differential distributive effects of public procurement (Nyeck 2016). Nevertheless, the need for this linking evidences the not-so-taken-for-granted status that gender, as a category of policy analysis and evaluation, occupies within the market-based economic models and practices that have dominated global policy reform in public procurement (McCrudden 2007). It is noteworthy here to pay attention to McCrudden's tale of the political hurdles encountered in not just affirming gender in public procurement reform in the UK, but in more precisely nesting it in existing and associative legislations on disability and other categories.

## Procuring Along the Equality Grain

To address the annoyances and questions that gender raises and the policy trajectories that this category brings to global public procurement reform, one needs not confine innovation to the margins. This is to say that conversing with the idea of equality in a more substantive way might provide us with better tools for discussing gender in public procurement without limiting the frame to discrimination only or to the traditional equal opportunity analysis. This is an invitation to consider alternative values and policy venues in probing the size and texture of the equality grain as perhaps of better nutritional value than the mere bringing in of discrimination sheaves in the procurement field. Assuming such a consideration is agreed upon, it becomes useful to ask, what is the subject of "gender" that brings a substantive (not just formal, procedural, or opportune) vision to equality in public procurement? This subject is, it is contended, the "vulnerable subject." Moreover, considerations for a substantive approach to gender equality must argue for valuing states' self-constitutive (Korsgaard 2009) functions and actions in an age of complex global governance arrangements. Hence the vision of a "vulnerable subject" as the center agent of a reformed vision of gender equality in public procurement is necessarily intertwined with concerns about the future of democratic (Freeman and Minow 2009), responsive and responsible governance (Poh and Stumpf 2005; Chooner and Greenspahn 2008). It therefore follows that "the vision of the state that would emerge in such an engagement would be both more *responsive* and *responsible*" (Fineman 2009, 2 My emphasis).

Martha Fineman defines vulnerability as that which "should initially be understood as arising from our embodiment, which carries with it the ever-present possibility of harm, injury, and misfortune from mildly adverse to catastrophically devastating events, whether accidental, intentional or otherwise" (Fineman 2009, 9). This universal and unavoidable human condition helps us understand that if no society can completely eradicate vulnerability, it can and does "mediate, compensate, and lessen our vulnerability through programs, institutions, and structures" (Fineman 2009, 2). These institutions themselves need not be treated as perfectly immune from vulnerability. Quite the contrary, institutional vulnerability mirrors, and must remain conversant with, the vulnerability of real-life subjects distinct from those willed as autonomous and independent in the liberal tradition.

Put differently, rather than starting a reflection from gender equality or equity or market efficiency, or state imperfections only, vulnerability

initiates a dialogue between *all* agents interacting in public procurement processes and values their lived experiences of self-insufficiency and interdependency. Hence one should consider "gender reality" not as a catalog of impediments or personal failures, but from the perspective of a "vulnerable subject" that sheds light on "the fact that societal institutions play a significant role in maintaining and extending inequality [and that] is the very reason that we need a more active state, one that is responsible to that reality" (Fineman 2009, 2). It is further argued that when states fail to respond relationally to "gender reality," they maintain a status quo in public policy between citizens. However, states extend state-citizen inequality by failing to recognize their own vulnerability, "a state of constant possibility of harm" (Fineman 2009, 2), when embarking on initiatives that steer them away from or downplay their constitutive function of public values promoters and protectors. Public discontent and scandals surrounding public procurement schemes are reminders that a one-sided conversation on the prospect of efficiency alone is not capturing the social dissonance that even a rule-conforming procurement may cause in society, not to mention government acquisitions tainted by corruption.

Supply-side improvement perspectives do indeed provide economic benefits to women entrepreneurs, but such benefits may also translate into waste or divergence of national resources from budget items that have significant impact on women. Kenya, for instance, has been hailed as a model of gender-responsive public procurement and one of the first African countries to adopt a 30% reservation scheme for women and youth and persons living with disabilities (Public Procurement and Asset Disposal Act, 2015 enacted in 2016 Section 1 57(5)). Yet, as Reuters reported recently, the procurement of an expensive body scanner in 2015 has had no effect on the health of Kenyan populations 5 years later. The expensive body scanner has never been used because the hospital it was sent to had no trained radiologists and the population still treks up to 150 km to get to a better-equipped hospital. In the words of a medical worker who was interviewed, "it is very disappointing that the government missed the opportunity to do something great for the health care system before it wanted to do procurement," a behavior the interviewee qualifies as "criminal" (Fick 2020). Five years after the purchase of the scanner, the discontent of the medical practitioner seems to justify the protests that the union of medical doctors and paramedical employees organized in Kenya from June to December 2016 when they took to the street chanting #LipaKamaTender (Pay us as you pay your tenders) (Gathigi 2016). These protests pointed to what was then perceived as a pattern of corruption and waste on misguided or overpriced subpar services in the health sector while the quality of social welfare diminishes. As studies show in the context of Europe, "the way that public services are governed, resourced, funded and delivered is crucial to women's lives" (Conley and Page 2015) and well-being (Glasby 2012). In Africa, access to healthcare services is strategic in public procurement, and not considering overlapping vulnerabilities, as the above-mentioned case in Kenya shows, is to tell only one side of the story about gender and public procurement reform. Gender-*responsive* procurement policy may respond to the demands of the supply side, but it does not always follow that empirical responsiveness alone makes governance more *responsible*.

A vulnerability framework does what existing economic and political models of public administration reform insufficiently do. First, as a heuristic device, vulnerability affords critical examination of the hidden assumptions about capability and its presumed reforming trajectories in public procurement policies and practices. Second, a vulnerability framework offers us a point of entry that rescues conversations about gender in public procurement from their peripheral statuses notwithstanding the regularity of gender mainstreaming initiatives sometimes bandwagoning and courting political correctness rather than critical and substantive commitment to the issue (Fineman 2009, 11). Third, a vulnerability framework is an invitation to think, legislate, and implement a relational approach to gender equality in public procurement on the

basis of a mutual and intercontextual recognition of the inexhaustibility of possible harm as not just a shared, universal, and human condition, but more pointedly as an *institutional* one also. Inherent susceptibility to harm and/or change therefore presents itself as a powerful non-exclusionary affirmative anchor that helps all parties involved (the state, the entrepreneurs, the consumers, and civil society) appreciate overlapping vulnerabilities in public procurement reform, thereby making gender equality everybody's business.

# Gender in Japanese Public Administration

Shugo Shinohara
Rutgers University – Newark, Newark, NJ, USA

## Synonyms

Gender in public management; Representative bureaucracy; Sex

## Definition

Division of status, roles, and opportunities between the two sexes in Japanese public bureaucracy.

## Introduction

Japanese governments have held considerably low levels of gender equality in their workforces. The 2016 Report of the Japanese Cabinet Office for Gender-Equal Society reports that the proportion of women workers who are division heads or higher was 3.5% in the central government and 8.5% in prefectural governments (equivalent to state governments in the USA), while that in the private firms which have over 100 employees was 9.8%. Unlike public sectors in most Western countries, the Japanese public sector, especially the central government, has been slow compared to the private sector to promote women to key decision-making positions. The theory of representative bureaucracy suggests that such under-representation of women will make a public bureaucracy unresponsive to women's interests, opinions, needs, desires, and values in its policy making and program implementation. Particularly in Japan, holding a legacy from the pre-war imperial government, the national bureaucracy has been described as a remarkably powerful institution in the English language literature (e.g., Koh 1989; Tsurutani 1998). Further, given the relative homogeneity of race and ethnicity, policy arguments around diversity have been centered on gender issues. Thus, the influence of gendered public administration and policy on the entire Japanese society could never be negligible. The extant Japanese studies have addressed gender equality in workplace mainly from legislative, managerial, and cultural perspectives.

## Legislation for Gender Equality

The pre-war Japanese legal system, including the Constitution and the Civil Codes, placed women at a subordinated position to men in the Confucian-style social hierarchy. The Japanese imperial government set the goal of women's policy as confining women to good wives and wise mothers. Right after World War II, the American Occupation forces, the Supreme Commander for Allied Power (SCAP), identified the improvement of women's status as one of the five main goals in its democratization policy for Japan. SCAP's initiatives led the post-war Japanese government to grant suffrage to women in the new election law, guarantee women's equal rights to men in the new Constitution, and create a policy agency for women, the Bureau of Women and Minors (BWM) in the Ministry of Labor, between 1945 and 1947. On the one hand, it was not until 1950 that Japanese women were allowed to take upper-class civil service examinations at both national and local levels. During the pre-war period, women's positions in the public sector were limited to lower-ranked officials and school teachers. Even after 1950, there had been no upper-level women officials in the central government, except BWM for a while. Women who passed the civil service examination were rejected from hire at an upper-level position by the key central ministries, which held large policy responsibilities, such as the Ministry of Treasury and the Ministry of Health and Welfare (Lebra 1981). Kobayashi (2004) describes that such male dominance in the key ministries prevented BWM, which was mainly comprised of women officials, from gaining sufficient financial resources and hence from implementing effective gender equality policies.

The enactment of the Equal Employment Opportunity Law (EEOL) in 1986 was the first legislative effort by the Japanese government to

minimize pervasive discriminatory hiring and promotion practices in both the public and private sectors. This had been, since its inception, a main policy goal for the BWM, renamed the Women's Bureau (WB) in 1984. The United Nations (UN)'s International Women's Decade (1975–1985) and the entailed ratification of the UN's Convention for the Elimination of Discrimination Against Women in 1985 enabled the WB to facilitate the arduous legislation process that involved strong oppositions from domestic employers and political leaders (Kobayashi 2004). Some scholars argue that the EEOL, although criticized for the lack of enforcement power, made a contribution to raising awareness of gender inequality and increasing women's entry into higher education and the labor market in the 1990s (e.g., Gelb 2000; Molony 1995).

The WB further pushed such key stakeholders as male political and business leaders to create a more comprehensive gender policy framework. The Basic Law for a Gender-Equal Society (BLGS) was enacted in 1999 as the first basic law for gender equality in all aspects of society, including education, employment, politics, and social security. As a practical action plan for implementing the BLGS, the Basic Plan for Gender Equality was then formulated in 2000 by the central government and implemented at each government level. The Basic Plan was revised in 2005, 2010, and 2015. It has set up key priority fields, including (1) expansion of women's participation in policy decision-making processes, (2) reconsideration of social systems and practices and raising awareness of gender inequality, (3) securing equal opportunities and treatment between men and women in employment, (4) men's and women's work–life balance, and (5) enhancement of education and learning to promote gender equality and facilitate diversity of choice. These expanded scopes of gender equality policy led to the establishment of the Council for Gender Equality and the Gender Equality Bureau within the Cabinet Office, headed by the Prime Minister in 2001. The WB in the Ministry of Labor was replaced with the Gender Equality Bureau, which has been in charge of not only gender issues in employment but also with overall coordination of policy design and implementation for creating a gender-equal society.

## Gender Equality in Japanese Management

Partly due to the legislation for gender equality, women's entry into the Japanese workforce steadily increased. The Ministry of Health, Labor, and Welfare reports that the proportion of women in the entire national workforce grew from 35.9%, in 1985, to 43.5%, in 2015. Particularly in the central government workforce, the proportion of women rose from 17.4% in 1985 to 26.8% in 2015. Despite such progress of women's entry into the workforce, women workers have been substantially underrepresented in decision-making positions. As shown in the introduction, the proportion of women who are division heads (director) or higher has been less than 10% in both the public and private sectors. Since the 1990s, a large body of scholarship has argued that Japanese management practices prevented women workers from climbing the career ladders in their workplace (e.g. Brinton 1993; Lam 1992).

In 1968, 20 years after World War II, Japan recorded the second highest Gross Domestic Product (GDP) in the world. In the 1970s and 1980s, Japan led the world economy. During this period, many Western observers regarded Japanese management practices such as lifetime employment, seniority wage and promotion, and collective decision-making as the best practices and hence worthy of emulation. In the 1990s, however, the Japanese economy experienced lengthy recession and stagnation, and some of the management practices, especially lifetime employment and seniority wage and promotion, were criticized as structural impediments. Government advisory bodies and business leaders raised the concern that these management practices were designed to sacrifice the values of personal life of the workers, and thus were not sustainable. In the context of gender, lifetime employment expects all regular workers, male and female, to stay at one organization from recruitment to retirement, with regular workers acquiring higher wages and positions mainly based on age and years of continuous service. However, due to childbirth and other family responsibilities, Japanese women workers have

suffered high penalties for dropping out of this regular career track (Shinohara et al. 2016).

These management practices have deep roots in not only private firms but also public agencies. Gordon (1988) sees lifetime employment and seniority wage and promotion in part as by-products of Japanese wartime totalitarianism. In the late 1930s, the imperial Japanese government issued a series of regulations on wages and company welfare policies (e.g., wages should rise with age, the best single proxy for need; income should meet minimum livelihood needs and should therefore be stable; and incentive pay, subject to fluctuation and rate-cutting, should be reduced or eliminated). In both public and private organizations, the Japanese management system has put women at a disadvantage.

## Male-Dominant Culture in Japanese Bureaucracy

Japan's modern bureaucracy is structurally similar to many of its Western counterparts, while some of the group-oriented working protocols backed by traditional culture are distinct (Fiftal Alarid and Wang 1997; Jun and Muto 1995). Group orientation – or groupism – stems from ancient Confucian values and rice farming practices in close-knit village community, where harmonious group work was required in order to share water resources, maintain wet paddy fields, and fight with famine and natural disasters. Haitani (1990) identifies these key dimensions of Japanese groupism in a managerial context: (i) identity formulation and a sense of security through an affiliation of group membership, (ii) hierarchical relationship among its members based on seniority, (iii) stress on the relationships of harmony and cooperation, (iv) exclusivism, and (v) rank and status consciousness. While groupism can lead to a higher level of efficiency and effectiveness in a collaborative work setting, it requires group members to prioritize the entire group goal over individual needs. Particularly in a male-dominant work organization, women's special needs, including maternity leave, would likely be largely neglected by the majority group – men. It is worth noting that groupism is highly integrated into such Japanese management practices as lifetime employment and seniority wage and promotion. These practices expect a continuous commitment of full-time workers to an organization to maintain its group cohesion and harmonious human relationships. Under the group-oriented management system, both public and private organizations have provided insufficient support and opportunities for women's maternity leave and reentry to the workforce.

Jun and Muto (1995) argue that, since fewer public workers leave their organizations until retirement, the attachment of Japanese public workers to group cohesion and human relationships would be stronger than that of their private counterparts. Given a strong group orientation, one of the most important qualifications for a higher civil servant is to establish harmonious junior (*kohai*) and senior (*senpai*) relationships. Specifically, the qualification of a leader rests primarily on his/her locus within the group, rather than his/her personal merit; the loyalty other members feel to the leader also derives from their position as a subordinate to him/her (Nakane 1970). As described above, the pre-war legal system placed women at a subordinate position to men on the basis of Confucian social order and hierarchy: emperor and nation, government and people, manager and subordinate, senior and junior, and men and women. Such lingering legacies from the pre-war imperial government might still prevent women officials from becoming leaders in the Japanese public bureaucracy. Furthermore, many Japanese bureaucrats develop group values and common experiences through socialization processes, especially after-work drinking and weekend social events. Holding childcare and other family responsibilities, some women officials could not be active in these social activities, and hence might lose opportunities to gain a pivotal position in a group. In the Japanese male-dominant bureaucracy, an emphasis on groupism engenders the marginalization of women – despite their numbers in society – as a minority.

## Conclusion

Although the percentage of women in the Japanese workforce has steadily increased over

the past 30 years, women workers have still been substantially underrepresented in decision-making positions, especially in the government workforce. Responding to international pressure, mainly from the UN, the Japanese legislation and policy framework for gender equality have made significant progress in the recent years. After the enactment of BLGS, more Japanese full-time workers view the treatment of gender in Japanese workplace as fair/almost fair with no significant difference of this view between the public and private sectors (Shinohara et al. 2016). On the one hand, this empirical evidence suggests that both public and private workers have become less conscious of the existing gaps between men and women in Japanese workplace. However, there is still a long way to go to achieving consensus on gender equality, especially in the central government, where the proportion of women who are division heads or higher is only 3.5%. In this vein, it would be essential for future studies to examine whether the recent legislative and policy efforts for gender equality affect gendered management practices and male-dominant culture. Without changing gendered practices and cultural norms among public workers, a high level of representative bureaucracy cannot be realized. Arguably, the existing underrepresentation of women in decision-making positions could hinder Japanese governments from achieving the goal of BLGS, a gender equal society, through implementing more effective gender equality policies and programs.

# Gender in Public Administration, Brazil

Iara Alves
Ministry of Economy and Federal University of Bahia, Brasilia, Brazil

## Synonyms

Feminism; Gender equality; Public policy; Representative burocracy; Women; Women's rights

## Definition

Gender in public administration refers to institutional arrangements to implement public policies to ensure just opportunities for men and women, to promote women's rights, and to guarantee equal representation in the public sector.

## Introduction

The concept of gender was first used as a tool to express social relation between men and women and organization of knowledge in the 1980s in Social Sciences, especially in feminist studies (Scott 1986). In the center of the discussion are the oppression and subordination that women have been historically submitted in their relation to men. Another important concept to understand when discussing gender inequality is intersectionality, a term coined by Kimberle Creenshaw, law professor, to bring light to the varied types of oppression women experience according to their race, sexual orientation, class, and other dimensions of identity. According to Creenshaw (1991), the interaction among existing vulnerabilities may result in more or less disempowerment of women. An educated white middle class woman, for instance, may have better chances to hire a lawyer and get rid of domestic violence than a black poor woman with low level of scholarship or no income. Highlighting the concept of intersectionality when discussing gender in public administration is clearly relevant in very socially and economically unequal societies.

Gender and race inequality in Brazil is certainly a matter of concern. Data show that black women in Brazil are in different economic, social, and political worlds when comparing to white women. The numbers show inequality among Brazilian women. For instance, the statistics of feminicide of black and white women show that, between 2003 and 2013, the number of black women murdered grew 54%, while for white women it has decreased 10% in the same period (Waiselfisz 2015). Black women have the worst positions regarding unemployment (13.3% black women were unemployed in 2015, while the average for all women was 11.6% and for men, 7.8%), level of education (10.9% of black women were illiterate in 2015, whereas white women were in the same rate as men, 4,9%). Finally, it is worth mentioning that 18% of black women worked as housemaids in 2015, while for white women, the rate was 10% (Instituto de Pesquisa Econômica Aplicada 2017).

Brazil is not a safe place for women. Along with Guatemala, Honduras, El Salvador, and Dominican Republic, it one of five the most violent countries of the region of Latin America and the Caribbean, according to the Economic Commission for Latin America and the Caribbean's (ECLAC) report of 2018. The absolute number of feminicide, which is gender related killing of women and girls, of Brazil is the highest in the region. As for relative numbers, it is the fifth in the world with 4,8 homicide for 100 thousand women (Waiselfisz 2015). Only El Salvador, Colombia, Guatemala, and Russia have higher women homicide index than Brazil (Economic Commission for Latin America 2018).

## Representation of Women in Public Administration

The high index of gender inequality and violence against women in Brazil may be a result of a strong patriarchal culture and historical inequality in Public Administration in Brazil. Brazil is the 167th country in the world in the ranking of women participation in the Executive Branch (UN Women 2017). In the last local elections in Brazil, in 2016, only 649 municipalities elected a woman as mayor out of 5570. Thus, women mayors represent about 11% of all Brazilian local mayors. In the 2018 election for governors, only one woman was elected out of 27 states, not even 1%. In 2018, women represented less than 20% of all national secretaries, nearly 20% of directors and less than 40% of coordinators in federal bodies (Escola Nacional de Administração Pública 2018). In the same period of 2018, of the 29 ministers appointed by the President, only one was a woman. On the other hand, women were 49% of federal public servants in 2018 (Escola Nacional de Administração Pública 2018). It is important to mention that to become a public servant in Brazil, one must pass a written, and sometimes oral, exam. Thus, women get to enter public service by their own merit. However, they are rarely considered for high posts in public administration, for these are freely appointed.

Despite the fact that women have the same level of education as men in public service, they are rarely chosen to be in high decision-making positions, for high public administration offices are majorly male.

As for the representation of women in the congress, despite the fact that more women were elected in 2018, only 15% of the lower chamber of the Congress are women. As compared to 2014, when the rate of women was 9,9%, there was a significant raise due to the fact that, in 2018, the Brazilian Supreme Court determined that public financial resources for political campaign be distributed for both genders in a minimum proportion of 30% and maximum of 70% for each gender. Since 2009, political parties were obliged by law to establish a minimal quota of 30% and maximum of 70% of each gender in the open list of candidates for the lower chamber, but the parties have not made it possible, competitive, and financially viable for women candidates. Only when the Supreme Court determined that the same proportion of money and time on TV campaign be guaranteed for both genders, the ratio of women in the congress increased, despite being far from being equal and not close to 30% yet.

The first law to establish quotas for women candidates was issued in 1996 and it obliged political parties to register at least 20% women candidates for the Low Chamber of the Congress. As mentioned before, the quotas were later, in 2009, increased to 30%, but they still did not result in a jump of women elected since they did not guarantee that women received the same treatment, resources, and privileges as men candidates by political parties. Only in 2018, after a minimum of public money was guaranteed for women's campaign, a slight increase of women in the congress was perceived.

## Women's Right History in Brazil

The historical scarce representation of women in public administration in Brazil has made women's rights and public policy for women advance slowly. 1932 marks the Brazilian feminist movement's first victory, as women won the right to vote, under the condition that they had their own income (married women had to be authorized by their husband to vote). Thirty years later, in 1962, the Statute of the Married Women guaranteed women the right to work regardless of their husband's authorization. Also, it gave women the right to heritage and to request the custody of the children in case of separation. However, divorce was only approved by law in 1979.

Only in the 1980s did the Brazilian Government start drafting public policies for women. The Program for Women's Health Assistance was launched in 1983, after strong demand by the women's movement. In 1985, the first specialized domestic violence unit of the police department was launched to prevent the increase of intimate partner killing of women in the country. In the same year, the National Council for Women's Right was created in the Ministry of Justice with the intention of promoting women's economic, social, political, and cultural rights.

The few 26 female members of the Congress in 1988, along with Brazilian feminist movement, had great relevance in the elaboration of the Constitution of Brazil. Known as the Citizen Constitution, the 1988 Constitution brought the greatest victories for women's right as it establishes that men and women are equal in rights and obligations by Law. However, even after its promulgation, the advance in the implementation of policies that guarantee women's integral citizenship has been very slow.

The Constitution of 1988 was a landmark for public policies that guarantee and promote women's right. For instance, it establishes that family planning is a free decision of a couple and the State must provide educational and scientific means for it. Therefore, Brazilian public service guarantees health public policies to assist women in pregnancy prevention, to receive complete prenatal treatment, birth assistance, disease control, sexually transmitted diseases prevention, penis, breast, and uterus cancer, among others. Protection during maternity was also foreseen in social rights. The Constitution guarantees that all working women have the right to fully paid

120 day maternity leave, with job stability. Fathers have the right of fully paid paternity leave of 5 days. In public administration, maternity leave has been recently, in 2008, extended to 180 days and the paternity leave to 20 days, in 2016, to all civil servants, without any discount of salary or risk of losing the job. It is worth mentioning that both, maternity and paternity leaves, are applied to adoption as well. The private companies that adhere to the extended maternity and paternity leave program win the title of "Citizen Company," and, in return, the full salaries paid to parents during the extension of their maternity or paternity leave may be deducted from federal taxes.

On the other hand, the Constitution declared protection of life since its conception. Thus, voluntary abortion in Brazil is still considered illegal, except in cases of rape, danger to a woman's life, or anencephaly (brain malformation of the fetus). Under any other circumstances, voluntary abortion leads women to 3 years in prison in Brazil. Despite a long fight in the Congress, headed by congresswomen with the support of women's movements, to decriminalize abortion in Brazil, religion has a very powerful influence on public opinion, which makes the debate controversial in Brazilian society and, consequently, makes it hard to approve pro-abortion laws. Only ¼ of Brazilian are in favor of women's free decision to terminate pregnancy and more than half defend that women should be incarcerated in case of intentional abortion (Institutos Patricia Galvão e Locomotiva 2017).

## Institutional Arrangements for Women's Right Implementation

Public administration in Brazil has promoted important institutional advances to promote gender equity, but with many challenges to overcome yet. In 2003, the Brazilian government launched the Special Secretariat for Policy for Women, linked to the Presidency, with ministerial status. Thus, the Minister of Women became the head of National Council for Women's Right, created in 1995.

As a result, a great process of social participation to elaborate public policies for women was started in 2004. The first National Conference for Public Policy for Women was organized by the Special Secretariat for Policy for Women and counted with more than two thousand delegates from all Brazilian states and municipalities, which had previously organized their own local conferences, adding more than a hundred thousand women to the debate. As a result of the conference, the National Plan for Public Policies for Women, a solid tool for consolidating a wide range of public policies aimed at women's autonomy and empowerment, presented goals and action plans for: job and citizenship, education, health, sexual and reproductive rights, violence against women, and monitoring and management of the Plan (Presidência da República 2017).

The National Conferences for Public Policy for Women were followed in 2007, 2011, and 2016 with the average of two thousand women participating in each event. Each National Conference was preceded by hundreds of local conferences, involving about two hundred thousand women during the four conferences (Presidência da República 2017).

The National Plans for Public Policy for Women constituted Brazilian Public Administration's main tool for gender mainstreaming. Gender equity was first introduced in Brazilian Public Administration as one of the goals of environmental, social, economic, health, education, and agrarian public policies, among others.

Therefore, the Special Secretariat for Public Policy for Women has been in charge of coordinating, monitoring, and evaluating all governmental actions aimed at women in the Federal Public Administration, which includes ministries, regulatory agencies, state companies, public foundations, and state banks. Also, it should orient the action of the federal government towards states and municipalities so as to promote federal policies. The Secretariat lost its status as a ministry in 2017, when it was transferred from the Presidency to the Human Rights Ministry. Since 2017, it has been a National Secretariat for Public Policy for Women, with less autonomy and power of inter-ministerial coordination.

## Public Policies to Prevent Violence against Women

The main actions of the Federal Public Administration, through the Secretary of Public Policy for Women, in the last two decades were aimed at combating and preventing violence against women in Brazil. Law 11.340 (2006), internationally known as "Maria da Penha" Law (The Law was named after Maria da Penha, a Brazilian women's rights activist whose violent husband attempted to kill her more than once and left her paraplegic. It was a long fight to put her husband in prison. She even had to take the case by herself to the Organization of the United States. She struggled to change the Brazilian law so as to increase punishment for the offenders, offer special domestic violence courts and 24-h shelters for abused women. The Maria da Penha Law is considered to be a landmark legislation on domestic abuse by the United Nations. Maria da Penha was 71 years old in 2018 and still working tirelessly to campaign on women's rights.), and Law 13.104 (2015), known as Feminicide Law, have changed radically the way Brazilian Public Administration and the Judiciary System deal with killing of women by former or intimate partner. Maria da Penha Law is considered to be ground breaking for Brazilian Public Administration for it has made the concept of the many types of violence against women clearer to Brazilian society and to civil servants; it has created 11 public services and protective measures for victims of domestic violence; and it has increased the penalty for aggressors. As a result, public mechanisms and tools to prevent violence against women were widely implemented around the country. Special Courts for Domestic and Familiar Violence against Women were created in order to judge and punish domestic violence with more rigor. A 24 h direct toll-free number (180) was created to report violence against women or get information about women's rights and public services aimed at women.

As a National Law, Maria da Penha has had different impact locally according to the institutional level of public protective systems of states and municipalities in Brazil. Cities that implemented specialized police stations for women (Delegacia da Mulher), Women's Shelter (Casa Abrigo) for those who need to be isolated from their violent partner and Special Courts for Domestic and Familiar Violence against Women had significantly better results in the mindset of the female population, since statistics show that women report the aggressors more often due to the fact that they believed that public action would be taken, according to an evalution made by the Applied Economics Research Institute of the Brazilian Government (Instituto de Pesquisa Econômica Aplicada 2015).

Therefore, the impact of the Law depends on the implementation of public policies by public administration. From 2006 to 2015, national e local public administrations in Brazil invested public resources to implement institutional mechanisms that resulted in the decrease of 10% of killing of women inside their own homes, preventing thousands of deaths caused by domestic violence (Instituto de Pesquisa Econômica Aplicada 2015).

## Conclusion

As it has been shown above, the presence of women in high public administration in Brazil, that is, in decision-making positions, is still scarce, be it in national or local level. Thus, the implementation of policies with gender perspective takes place in very slow paths. Despite having high level of education, female civil servants are rarely appointed to high positions, occupying an average of only 20% of high positions in the executive branch. As such positions are politically appointed, without any official selection criteria based on knowledge or curriculum, the low representation of women in public administration may be a result of the low representation of women in the Congress, 15% in the Lower Chamber. The biggest victories for women's rights were accomplished in Brazil due to strong movements of women and a few women in the Congress during the elaboration of the Constitution of 1988. Later, the biggest progress was on policies to prevent violence, which were also due to the

persistence of Maria da Penha herself, the presence of a woman president, support of national and international women's organizations, congresswomen, institutional arrangements to coordinate policies for women and strong media pressure. As seen above, Brazilian women were also protagonists in the elaboration of the National Plans for Policy for Women during the four national conferences organized by the Special Secretariat for Policy for Women from 2004 to 2016. However, for the effective implementation of public policies on the many areas described in the Plan, it is important that white and black women be in leading positions to elaborate and implement policies with gender and race perspective for job, citizenship, education, health, sexual and reproductive rights, and others.

# Gender Representation in the Public Sector

Sebawit G. Bishu
School of Public Affairs
University of Colorado Denver, Denver, CO, USA

## Synonyms

Closing the gender gap in public employment; Women's participation in government employment; Women's representation in public employment

## Definition

Equal opportunities for women in the public workforce.

## Introduction

A bureaucracy that is representative of the public it serves can be beneficial in two ways. First, it can help shape policy interests that represent the population it serves (Park 2012). Second, bureaucracies that reflect the population may promote responsive and effective service delivery (Seldon

1997). This chapter applies this understanding to gender issues. The literature has repeatedly demonstrated that gender representation is not only desired but also necessary for the effective implementation of public services. Despite the fact that women are increasingly participating in the formal economy, today in the twenty-first century, the gender gap remains visible. This chapter has three main sections. The first section presents a discussion on the different forms of gender representation in the workforce. The second section identifies and discusses barriers to equitable gender representation in the workforce. This section provides a discussion on individual- and organizational-level barriers to women in the workforce. The chapter ends with a discussion on why promoting equitable gender representation matters to individuals, organizations, and society as a whole.

## Gender Representation in the Workforce

The theory of representative bureaucracy provides the argument that public servants (bureaucrats) that share demographic characteristics with the public act in ways that benefit the public they serve (Mosher 1968). The theory widely applies two forms of representation: passive and active representation. Passive representation applies to the situation when public employees share demographic characteristics with the public they serve. The two most often studied forms of passive representation are gender and race/ethnic representation (Atkins and Wilkins 2013; Mosher 1968). Active representation, on the other hand, occurs when shared demographic characteristics prompt bureaucracies make decisions that benefit the community with whom they share demographic identities. The discussion on gender representation in this chapter primarily focuses on passive representation of women across different occupations, agencies, and positions in public organizations.

The literature on gender representation identifies three ways that women are being stratified in the workforce. Occupational representation identifies the underrepresentation of women in male-dominated occupations and their overrepresentation in female-dominated occupations. Agency representation concerns with women's underrepresentation in agencies that serve specific purposes and their overrepresentation in others. Position representation uncovers the underrepresentation of women in management and leadership positions. To describe position segregation, the literature often uses the glass-ceiling metaphor to explain the barriers that women face when climbing organizational ladders. The barriers vary by occupational and agency categories. The following section presents a discussion on each of the aforementioned types of gender representation in the workplace.

### Occupational Representation

Occupational representation traces the equitable or inequitable presence of women and minorities within and across occupational categories. Compared to the other two types of workplace gender representation, inequality is most pronounced in occupational representation. Overtime, gender-based occupational representation gap has shifted for some occupations but not for others. Historically, women are underrepresented in science, technology, engineering, and mathematics (STEM) fields and are overrepresented in education- and social service-related occupations (Alkadry and Tower 2014).

The occupational divide along gender lines has implications for women in the workforce. The first is lower economic return. In the workforce women are often overrepresented in occupational categories that offer lower pay. Gender-based occupational segregation is also a contributing factor to the gender wage gap (Bishu and Alkadry 2017; Hsieh et al. 2013). The second implication links to the argument presented by active representation. That is, the scarcity of women in male-dominated occupations provides less opportunity for women to engage in policy decisions that have direct and indirect consequences to the public (Hindera 1993).

### Agency Representation

Agency representation traces the equitable presence, underrepresentation, or overrepresentation

of women in different types of agencies. The literature indicates that women in government tend to be overrepresented in redistributive agencies (Kim 2004; Newman 1994). Alkadry and Tower (2014) discuss that "redistributive agencies include all agencies that are concerned with the reallocation of money and provision of services to certain segments of society and include agencies dealing health, welfare, or education" (p. 102). In contrast, women are underrepresented in distributive and regulatory agencies (Alkadry and Tower 2014). The working nature of distributive agencies is such that they require a high degree of collaboration (Newman 1994). Regulatory agencies represent agencies that are concerned with rulemaking and implementing governmental laws and regulations (Alkadry and Tower 2014; Newman 1994 and Lowi 1985). Even within redistributive agencies, key leadership positions are often occupied by men (Miller 2009; Riccucci 2009). Moreover, the absence of equitable representation in distributive and regulatory agencies leaves women with limited opportunity to participate in policy decisions concerning the work of these agencies.

### Position Representation

Position representation uncovers the equitable, under-, and overrepresentation of women in leadership positions in organizations. The literature often uses the glass-ceiling metaphor to illustrate the barriers and challenges that women experience as they climb up organizational ladders. Bishu and Alkadry (2017) report that "promotion in the context of the glass ceiling concept addresses lack of equal opportunity presented to men and women in advancing into higher management positions" (p. 72). Current studies that examine gender representation in leadership positions argue that the human capital deficit argument does not explain the underrepresentation of women in leadership positions (Alkadry and Tower 2011). This is because today in the twenty-first century, women are increasingly engaged in pursuing educational and work opportunities. Gender representation in leadership positions also vary by occupational and agency categories. In occupations and agencies where women are overrepresented, the opportunity for women to engage in management is also higher. As it is the case with occupational and agency representation, engaging at management positions provides women the opportunity for policy participation and economic gain. Bishu and Alkadry (2017) report that access to management or leadership positions is one of the most critical predictors of the gender pay gap in the workforce.

## Multi–Level Obstacles to Women in the Workforce

Individual-, organizational-, and societal-level factors shape the underrepresentation of women in male-dominated positions, occupations, and agencies. At individual level, social norms inform the roles that women play in their private and public lives. At organizational level, gendered organizational processes shape the opportunities that are accessible to women in the workforce. At societal level, gendered social norms shape stereotypes that determine who is fit to engage in certain occupations, positions, and organizations. The following section provides a discussion of the aforementioned barriers that limit women's full participation in the workforce.

### Societal–Level Factors: Gender Stereotypes

Gender stereotypes shape societal expectations of the role that men and women play in their private and public lives. Socially constructed gender stereotypes define the domain within which women engage in the workforce. Sabharwal (2015) presents that "A major source of discrimination in any organization is the strongly possessed values, beliefs and perceptions about the social role and behaviors of men and women" (p. 5). Hence, Sabharwal suggests that gender stereotypes are the underlying factor that fosters gender-based discrimination in the workforce.

Theoretical frameworks like social role theory or think manager, think male explain how gender relations in society shape perceptions of roles played by men and women in the workforce (Sabharwal 2015; Schein 1975, 2001). Think manager, think male theory specifically describes

that masculine stereotypes often associate managerial or leadership roles as being fit for men (Schein 1975, 2001). Gender stereotypes limit opportunities that are accessible to women in the workforce, including opportunities to engage in male-dominated occupations, agencies, and positions. That being said, one cannot deny the changing landscape for women in the workforce. In the twenty-first century, with women's increased participation in education and the workforce, stereotypes are slowly changing form and women are increasingly engaging in traditionally male-dominated roles. Nevertheless, the process is far from being undone (Guy and Newman 2004; Kelly and Newman 2001; Newman 1994; Stivers 2000).

### Individual-Level Factors: Conflicting Roles of Care and Work

Socially constructed gender roles define the roles that men and women play in their private and public lives. Despite significant progress made toward women's increased participation in the formal economy, they still bear the heavy burden of family caregiving responsibilities. Women that navigate the dual roles of family caregiving while juggling the demands of work are often discriminated at because they are perceived as less dedicated to the job (Smith 2012). Organizations also perceive the dual roles that women play as a factor that limits their ability to commit to the duties of the organization.

The challenges that women with family caregiving responsibilities experience are twofold. First, despite their ability to navigate work and caregiving responsibilities, women are often penalized for playing dual roles. Studies that compare the career trajectory of men and women before and after having children report that men are rewarded and women are penalized for having children (Kmec 2010). Kmec (2010) reports that family responsibility is perceived as a positive stabilizing factor for men, whereas for women, it is perceived as a destruction and as a factor which compromises their dedication to their job, the organization, or their career as a whole. Penalties in this case manifest in the form of "parental pay gap," missed promotion opportunities, or poor performance evaluation (Kilbourne et al. 1994; Smith 2012).

The second penalty relates to career choices that women are often forced to make when faced with challenges of balancing work and family responsibilities. Career choices that involve on-and-off time from work have detrimental impact on the career trajectories of women. In the absence of social and institutional support, women are often forced to make career choices that involve on-and-off time from work. Therefore, organizations that fail to provide needed support for women to fully engage in the workforce are directly or indirectly shaping their engagement in the workforce.

### Organizational–Level Factors: Gendered Organizations

Organizations are a place where collective societal values, structures, and processes are manifested. Kanter (1977) argues that "while organizations were being defined as sex-neutral machines, masculine principles were dominating the authority structures" (p. 46). Despite organizations being a reflection of societal values, their managements and work processes are often perceived as gender-neutral. Kanter's work highlights the link between societal beliefs about gender roles and gendered organizational practices. The fact that most powerful positions, occupations, and agencies in government are populated with men is not a random occurrence but rather a process that demonstrates organizations as gendered processes.

Acker (1990) argues that "a systematic theory of gender and organizations" is critical to uncover gendered processes in organizations that reproduce unequal outcomes for men and women in the workforce (p. 140). She further argues that "organizations are one arena in which widely discriminated cultural images of gender are invented and reproduced" (p. 140). Here Acker identifies gender as the central element shaping organizational reasoning. Gendered organizational processes produce outcomes that reinforce societal gender stereotypes. Outcomes of gendered organizational practices are made apparent when women are

missing from positions, occupations, and agencies that are recognized as male domains.

## Why Representation Matters?

This section provides a discussion on why we should promote increased gender representation across different occupations, agencies, and positions in the public sector. The discussion here presents the benefit of gender representation from three standpoints. Discussed first is organizational-level benefit of gender representation. Second, citizens' perspective discusses the symbolic and substantive values of gender representation in public organizations. Last, from individual standpoint, presented here are economic and social implications of gender representation in public organizations.

Equitable gender representation yields several benefits to organizations, its workforce, and citizens. From organizational point of view, opportunities for women to engage in male-dominated occupations, agencies, and positions open possibilities for organizations to tap into diverse perspectives. Discussing the added value of a diverse workforce where multiple identities are represented, Pynes (2013) presents that "evidence is growing that managing diversity leads to greater service effectiveness, efficiency, and productivity" (p. 115). Pynes further argues that organizations that tap into diverse workforce are able to draw on "creative alternatives" (p. 115). Creative alternatives are a result of multiple perspectives and viewpoints. Inclusion of multiple viewpoints enriches the policy-making process as well as policy outcomes. The hope is that, as more women engage in traditionally male domains, gendered organizational processes will give way to gender-conscious processes and outcomes.

The importance of gender representation from citizens' standpoint presents two arguments. First, increased women's participation in male-dominated spaces suggests better opportunity for women to make substantive contribution representing the public. Opportunities to represent public interest manifest in policy participation and service delivery. Second, the symbolic significance viewpoint of gender representation highlights that when women increasingly engage in traditionally male domains, the process aids to overcome gendered stereotypes. As more women engage in traditionally male occupations or in breaking the glass ceiling, the process helps to transform societal and institutional perceptions of the role that women play in the public sphere.

Individual-level argument highlights economic and social implications of gender underrepresentation in certain agencies, occupations, and positions. Research repeatedly demonstrates that position and occupational underrepresentation of women in male-dominated spheres accounts for a greater share of the gender pay gap in the workforce (Alkadry and Tower 2014; Bishu and Alkadry 2017; Blau and Kahn 2007). Similarly, research that indicates increased women's representation in male domains shows that the process assists in reducing the gender pay gap (Hsieh et al. 2013). The rationale behind the gender pay gap argument is that male-dominated occupations and positions are associated with "male-oriented pay." Hence, women working in female-dominated domains experience earning penalty for working in predominantly female occupations, agencies, and positions. Besides pay penalty, the literature shows that unequal opportunity for women in the workforce has implications for social recognition and job satisfaction (Kanter 1977; Jaffee 1989; Smith 2012).

## Conclusion

Despite women's increased participation in the workforce and acquired comparable qualifications as their male counterparts, research shows that they continue to be underrepresented in traditionally male-dominated occupations, agencies, and positions. This chapter presents a case for gender representation in the public sector workforce while also highlighting individual- and organizational-level barriers. The challenge of undertaking gender integration in traditionally male-dominated spheres calls for interventional efforts at individual, organizational, and societal levels.

# Gender Wall and the Political Participation of Women in Australia

Fardaus Ara[1] and Jeremy Northcote[2]
[1]University of Rajshahi, Rajshahi, Bangladesh
[2]Murdoch University, Murdoch, WA, Australia

## Synonyms

Gender and political representation; Gender equality in politics; Women and politics; Women's representation in government

## Definition

Political participation refers to the ability of a group of women or individual who are elected to a national legislature or local government body and try to make policy makers responsive to their

needs while gender wall consists of the impediments to their access in electoral politics.

## Introduction

Women are disproportionately represented at all levels of politics worldwide. There is an extensive scholarship (Rosen 2011; Stockemer 2015) on the factors affecting the political participation of women, ranging from traditional gender roles; role of the media; socialization processes; adverse political cultures; conservative cultural doctrines; financial barriers; violence, harassment, and security; and lack of self-confidence, amongst others. However, these barriers vary according to the geography, culture, and political system of countries.

Australia is an example of a modern, Western nation with a multicultural ethos and a strong emphasis on public education and – rhetorically at least – a "fair go" for all. In Australia, tremendous gains have been made in women's participation in politics (Australia being amongst the first countries to permit women to enter politics). Nevertheless, the disparity in gender representation in politics remains at all levels – federal, state, and local. Although the representation of women in parliament has steadily improved since women were granted the right to vote and stand in federal elections following Federation in 1901, particularly in the Senate where women comprised 40% after the 2016 election; however, the proportion of women in the House of Representatives has changed little since 2001, hovering in the range of 25–29% (Australian Electoral Commission n.d.; McCann and Janet 2014). Besides, only 15% of local government mayors and less than 33% of local government councilors are women (Tait 2018).

It is clear that in Australia and other modern nations, even as direct forms of discrimination are removed, cultural values that relegate women to home-care duties persist (Wei-hsin & Lee 2013). These cultural barriers can lead women to be less likely to pursue careers in areas that involve spending a significant amount of time away from their families, or where they are likely to be condemned for not taking up traditional domestic roles in addition to their careers. Further, a range of occupational cultures promotes hypermasculine tendencies and sexist behavior that can be intimidating for women.

This chapter examines the barriers to women's participation in electoral politics at the local and national (federal) levels in Australia using qualitative data derived from semi-structured face-to-face interviews with female politicians. It is found that there is a subtle effect related to indirect discrimination that comprises an invisible gender "wall" that inhibits women's participation in formal politics (Folke and Johanna 2016; Zamfirache 2010). It is argued that the gender wall links together a hypermasculine political arena with a wider traditional discourse of femininity, which exacerbates challenges such as raising funds, travelling, bullying, and networking in ways that impact women more than men, hence constituting forms of indirect discrimination.

### The Political System in Australia

Australia, officially known as the Commonwealth of Australia, is a federation of six states: New South Wales (NSW), Queensland (Qld), South Australia (SA), Tasmania (Tas), Victoria (Vic), and Western Australia (WA), along with two territories – Northern Territory (NT) and Australian Capital Territory (ACT). These former British colonies united to form the Commonwealth of Australia in 1901. Apart from the national parliament, each state or territory has its parliament and government. All states except the Australian Capital Territory have local government as the third tier of government. The party or coalition with the majority of seats on a preferred basis in the election in the lower house or House of Representatives (150 members) forms the government. Bills need to be approved by the Senate or the Upper House (consisting of 76 members, 12 from each of the six states and two from each of the mainland territories) to become laws. Federal elections are held at a minimum of every 3 years counting from the first session of Parliament following the previous election, and usually, all the seats in the Lower House and more than half the seats in the Upper House are declared vacant for election (McAllister 2006). The

Australian Labor Party (ALP), the Liberal (LIB), the Nationals (NAT), and the Greens (GRN) are the major political parties.

## Barriers to the Political Participation of Women

The interviews identified several impediments to the political participation of women in the federal and local level of government that can be grouped into three major categories.

### Socioeconomic Barriers

#### Family Responsibilities

The federal participants in Australia identified household duties as the major hindrance to the political participation of women in Australia. Women, specifically those with young children, suffer because of a shortage of time to get involved in politics. Additionally, lack of cooperation from partners and other family members forces them to juggle between family and politics, often compounded by extensive travelling (Australia being a large country), which tends to impact family responsibilities. According to one participant:

> The balance of work and family commitment is difficult; many women see the juggle of having a family and entering Parliament as too complex and give up the idea of entering politics.

Likewise, another participant stated:

> Women have the primary responsibility to look after children and seniors in the family. Therefore, women with young children find it difficult to travel and stay long hours in Canberra without family support.

Male politicians would also face the challenges regarding family responsibilities, but the burden tend to be stronger for women who are culturally expected to be more devoted to caring for their families.

Similarly, the local government participants in Australia also recognized family responsibility as an impediment to their participation in politics. Previous studies on women's participation in Australian politics (Irwin 2001; O'Flaherty 2005; Sawer and Marian 1993) have also identified family-related activities as a major impediment to their participation.

#### Lack of Finance

Finances are integrally related to participation in politics. The costs of canvassing, travelling, campaigning, and other expenditure often rely more on donations and private wealth than internal party funding which tends to be concentrated among party leaders. All the federal participants admitted the necessity of financing. According to a participant:

> It costs a lot of money to be a candidate and fundraising is a difficult job for women. Therefore, it gives additional advantages if you are financially well-off.

The local government participants of Australia also emphasized on financial resources, although as the catchment area is small and the candidates do not need to arrange the same amount as their federal counterparts. It is worth mentioning that local government in Western Australia is an unpaid job. So one needs to be financially well off to bear the expenses of election campaigning.

Likewise, Drabsch (2003) and Swain (1997) found that many women lack the financial resources essential to vie in the election as women in Australia usually have to spend time out of the workforce or in casual or part-time employment more than men.

#### Harassment, Assault, and Intimidation

The federal participants identified sexism and bullying in Australian politics as an impediment to women's participation in politics. One participant commented:

> Conservative attitudes, sexism, flirting are still in practice among the political parties (especially among the conservatives) and act as barriers to women. I was intimidated several times by a LIB male politician.

While such behavior is, to some extent, part and parcel of the rough and tumble nature of political life in Australia, it can easily slip into a condescending and misogynist tone (or can readily be interpreted as such) when it takes place between politicians of the opposite sex.

Several studies (O'Flaherty 2005; Sawer 2013; Summers 2013) have identified the prevalence of sexist behavior and harassment in Australian politics. Australia's first female Prime Minister Julia Gillard claims to have been subjected to sexual discrimination, harassment, and bullying as Prime Minister (Sawer 2013; Summers 2013).

Similarly, the local government participants affirmed that sexist behavior is evident in councils. One participant claimed:

> We have two males here who openly bully two of us women. It went so bad a couple of years ago that we held a special meeting about it. It improved for a little while; it is now again in full force.

According to Australian Local Government Women's Association [ALGWA] (2009), the 2009 survey conducted on women in Australian local government found that 45% of the elected women representatives faced harassment, bullying, and sexist remarks in the council meetings.

## Political/Institutional Barriers

### Aggressive Nature of Politics

All the federal participants mentioned the aggressive nature of politics as a severe hurdle to the political participation of women. According to a Labor participant:

> Politics is aggressive. The aggressive character of the work, the look of Parliament on our nightly news is like a bear pit, and many women do not want to work in such an environment.

A LIB Party interviewee listed the "brutal" nature of politics and characterized politics as a "man's game." According to her:

> Politics is still a man's game and quite hard for women. Politics is time-consuming, brutal, demanding, needs sacrificing the family life that many women cannot afford.

The local government participants also recognized the aggressive nature of politics as a deterrent to the political participation of women. One councilor said:

> Women have the overall attitude that politics is a men's game. Politics is very antagonistic to what women are afraid of. Because it is so competitive and combative, it does not suit a lot of women.

### Discrimination by Political Party

All the parliamentary participants recognized bias in the preselection process as a barrier, remarking that parties tend to allocate women to marginal seats that are difficult to win. A participant stated:

> The party officials do not give the nomination to women. The party also can be a very unfriendly place for women; it can be a very masculine environment, and male politicians support other men, not women. In the time of party official positions or pre-selection for the candidacy, women are often neglected.

According to Liberal Senators Linda Reynolds and Jane Hume, Coalition women overwhelmingly contested more marginal seats they have little chance of winning (Norman 2016). Ms. Gambaro, a Howard government minister, criticized the Liberal party's approach to female representation and said that the situation, especially in her home state of Queensland, was "getting worse" (Lewis 2016). However, party attitudes toward women are changing although progress has been slow.

Participants were asked if party quotas and the provision of reserved seats are useful for increasing the participation of women in politics. Although different gender quotas are widely practiced globally to increase women's participation in politics, the implementation of quotas is rather controversial in Australia. The Australian Labor Party adopted an Affirmative Action Rule in 1994 to ensure preselection of women for 35% of winnable seats at all parliamentary elections by 2002. The party revised the quota several times and finally in 2015 adopted a 50:50 quotas for both gender to be implemented by 2025 (Bramston, 2015; Peatling 2015). In Australia, the ALP has the highest share of women in the House of Representatives, credited by many to the Labor's quota policy. The Coalition parties (Liberal and the Nationals) do not believe in quota and instead emphasize mentoring, training, and networking sessions to bring more women in politics (Drabsch 2007).

Participants at the Australian federal level were mixed regarding the importance of introducing a quota system as a possible solution to the gender imbalance. A participant stated:

> I support a quota, and I think because of the gender quota, the number of Labor women in politics has increased, and it needs to continue, as politics is still male-dominated. More women in politics are required to raise women's interests. I hope one day there will be no need for a quota, but at the moment we need to continue quota.

However, despite the challenges faced in achieving a gender balance amongst the Liberal Party candidates, the quota system was seen by at least one female member as not the right way to address it as she asserted:

> I do not support quota. I support target, and I think these two are entirely different. People often say that women are getting elected as women, not on merit, and many women do not like to hear this. We need to develop policies to recruit more women on merit.

The quota system is seen by many Liberal members as philosophically problematic, and in the long-term counterproductive, for promoting merit-based participation where gender ceases to be a relevant factor. This view reflects a fundamental ideological divide between the Liberal and the Labor in Australia concerning their approaches to dealing with gender inequality and social inequality in general.

As local government election in Western Australia is nonparty based, local government representatives did not give their opinion on the role of political parties. However, they expressed their opinions on quotas for women. A participant stated:

> I am not a great fan of quota. I do not like to think that I am elected on quota or such. However, the quota has a role in male-dominated areas. I believe it brings critics from people who have prejudices against women.

However, other participants felt that a quota system might be introduced at the local level for a certain period to increase the participation of women, as local politics is dominated by men. One participant stated:

> I think one should get elected on one's merit. However, at this moment politics is entirely male-dominated. I consider quota might help to break the male-dominated barriers by giving scope to women.

## Cultural Barriers

### Traditional Gender Roles

The expectations of women to take primary responsibility in child-rearing and housework outlined earlier were presented as practical challenges for women to balance their political careers. These and other inequalities were also talked about by participants in the context of broader obstacles related to traditions and patriarchy. All the federal participants identified the traditional gender division of labor as a major impediment to the political participation of women. A parliamentary participant claimed:

> I think the traditional values of – women being the house carer and men being the breadwinner – are an issue. The traditional cultural system has strong expectations from women. The various responsibilities of women, including caring responsibilities for their families, sometimes make them feel that it is not the right time for a public position.

For those women who do enter politics, they must continue to contend with these traditional cultural expectations. One participant suggested that female politicians were in a no-win situation:

> The attitude of the general community is the key, and there are conservative attitudes from men as well as women. In some cases, female politicians are judged very harshly if they have children and participate in politics. Then female politicians can be judged again for not having children.

Likewise, all the local government participants share the same views on the impact of traditional gender roles. According to one participant:

> There is still an expectation from the community that women, in addition to, participating in politics must take on family responsibilities more than men. Although it is changing slowly, women in Australia are judged by common people as a wife and mother first; that places lots of pressure on them.

The traditional gender roles in the family, community, and society encourage women to

prioritize the private domain of home to take care of household needs and look after their husbands and children, thus leaving them with little time to engage in politics. An Australian Study of Parliament Group (1994) and Lumby (2000) found popular attitudes toward women's role as a deterrent to their participation in politics.

### Self-Confidence

The parliamentary participants felt that lack of self-confidence is a barrier to the political participation of women. According to a participant:

> In Australia, many women suffer due to a lack of confidence that acts as a barrier to joining politics. Women do not think that they have the skills to survive in politics. There are still women, in general, who have no confidence because of the lack of proper training and mentoring.

Local government participants also mentioned the lack of self-confidence as an impediment to the political participation of women. According to a local government councilor:

> Some women have a lack of confidence to join politics. Especially, younger women fear to join politics because men can be very demeaning to women, put down women easily. They also feel uncomfortable to deal with men.

Therefore, women need to be mentally tough and confident to participate in electoral politics.

### The Role of the Mass Media

The federal representatives in Australia mentioned the treatment of women by the media as a negative factor for women in politics. A participant commented:

> The media is very critical towards women. We have to rise early in the morning before men; we have to do a lot of makeup, a large wider wardrobe than men do. We have to travel all the time, and it is much more stressed to get ready, check my appearance, how am I looking in public.

Another participant said:

> There is still some discrimination around gender, and that is reflected in the expression of some media towards female politicians. A female politician needs to check her dress, hair, smiling face, appearance when going outside, while a male does not need to. It puts extra pressure on us.

However, media treatment was not a factor cited by local government participants. This is understandable, given that local members are not as scrutinized as federal members.

## Exploring the Reasons for Barriers

Women in both the federal and local government identified almost similar barriers. However, the differences are the result of certain social and political features of federal politics, such as the role of political parties while nominating candidates and access to finance, which create extra burdens on women. Culture, religion, society, and community create hindrances for women's participation in the public sphere including politics. On the other hand, education, industrialization, affirmative action strategies and progressive laws, and UN initiatives create favorable environments for women to come forward and take part in politics and leadership roles. However, patriarchy dominates all public and private sectors that favors men while women are discriminated indirectly or directly depending on the context they exist.

The cultural dimension of gender discrimination can be framed in one of two ways: either as traditional gender attitudes that endure in modern society; or as patriarchal norms that permeate cultures, both modern and traditional. The first approach draws from modernization theory and holds the view that gender discrimination persists due to the existing deep-rooted traditional attitudes regarding appropriate sex roles in societies despite economic development, but is only a matter of time until they are completely eliminated. The second approach draws from feminist theory and holds that gender discrimination is universal due to men's tendency to subordinate women and will persist unless patriarchy is challenged.

The interview data indicate similar barriers experienced by women at both the federal and local levels of government. The only differences between the two levels pertained to certain unique features of federal politics, such as the greater role played by campaign finances, party preselection, greater distances required to travel (Australian

federal parliament being located in Canberra), and media publicity, all of which place additional pressures on women who tend to struggle more to raise campaign funds, receive party support, take absence from their families, and to be taken seriously by the media.

An important aspect of the factors cited is that, for the most part, they are factors that constitute challenges for men and women alike. Issues of family responsibility, extensive travel, lack of financial backing, bullying, difficulty attracting party support, coping with the aggressive nature of politics, and negative media attention are issues that both male and female politicians often come up against, and have undone many aspiring politicians and seasoned politicians alike. However, the negative effect of these factors on women is exacerbated by traditional patriarchal expectations – both in society generally and politics in particular – that make them strong barriers for women pursuing a political career.

The institutional factors emphasize qualities that indirectly discriminate against women because of the societal gender factors. For example, intimidation can be viewed as a psychological barrier to entering politics, which is partly amplified by many women being socialized into being timid, and partly by the political institution being an aggressive arena. Cultural barriers are also the outcome of socialization. Modernization and/or feminist liberation have seen some cultural views diminish, notably the view that a woman's place is in the home, which has eroded a key barrier for women entering politics.

However, as research noted earlier has found, a range of gender-based sentiments remain in the wider culture, shared by both males and females (although females to a lesser extent). These sentiments centre around "emphasized femininity" (Connell 1987) that are generally not well matched with those emphasized by politicians, with the feminine ideal of the gentle, caring lady rubbing up against the political, hypermasculinized ideal of the cunning, boastful politician.

Other feminine cultural factors also have a negative relationship with political-institutional factors, particularly those in federal politics. Women often lack the same degree of financial support that males do as a result of income inequalities. Media attention is often more difficult for women to deal with due to the public pressure placed on female politicians to aspire to feminine ideals of beauty and a caring demeanor. Because of perceptions by party leaders that women are less popular among voters, gaining preselection (and also access to party-distributed funds) can be difficult for women. Finally, women face greater pressures to manage their family responsibilities, because patriarchal norms dictate that looking after the family is the women's primary role. The challenge of travelling great distances is linked to time away from the family, which exacerbates anxiety and practical challenges that attend childcare.

These factors are all examples of indirect discrimination that deprive women. Indeed, the factors mentioned by participants – when viewed in isolation – may seem rather innocuous, but when viewed within the context of gendered expectations, become powerful constraints that particularly disadvantage women. These constraints can be characterized as a gender "wall" which offers a useful metaphoric contrast to the "glass ceiling" concept (Folke and Johanna 2016; Zamfirache 2010) that is normally reserved for vertical advancement within hierarchies.

At the heart of the "gender wall" is the clash between the societal discourse of femininity and the hyper-masculine nature of Australian politics. Modernization and/or feminism have altered the discourse of femininity by invalidating certain past core attitudes, such as "a woman's place is in the home" which has opened up politics as a viable career path. But liberalization in this respect has not invalidated others that remain core to emphasized femininity (Connell 1987) and which serve as barriers to political participation. An institution like politics, which is expressly concerned with the exercise of power, involves the emphasis of traits that fall comprehensively into the hypermasculine ideal. When women navigate an institution like politics, they must chart a difficult path that involves either embracing masculine ideals or adapting emphasized femininity in unorthodox ways, both strategies that come with their attendant challenges.

## Conclusion

There is a "wall" of barriers for women entering and maintaining a career in politics. Feminist movements and legislative changes at the macro level have succeeded in dismantling some of the key tenets of emphasized femininity, such as the view that the primary place of a woman is at home, but not other key tenets, such as a woman's primary responsibility is to care for her family, to be gentle and caring, and to be glamorous and beautiful. Arguably, these tenets have become more institutionalized in modern culture as part of the gendered discourse of the "modern woman" – the view that women can balance their newfound careers with traditional expectations relating to femininity.

The issue of whether inequality is due to the continuity of "pre-modern" traditions (keeping in mind too that Australia is largely a migrant country with many new arrivals from traditional societies), or other contributing factors that sustain women's disadvantage, is a complex matter and not one that can be adequately addressed here. Neither is it the intention here to comprehensively address how these barriers can be overcome, although certainly institutional reforms and a wider shift in values, some of which have already been attempted, can go a long way. For example, a decision was recently taken in federal parliament that breastfeeding politicians will be allowed to bring their children into the chamber as part of new rules for a "family-friendly" Parliament. In addition, Mr. Pyne, Leader of the House, states that both men and women would be allowed to bring their children into the chamber if they are responsible for their care (Anderson 2016). But the sentiments that characterize gender expectations and the gender wall that inhibits women's participation in politics still predominate, and their entrenched nature, even in relatively liberal modern societies such as Australia, is proving difficult to counter.

There are also other difficulties in combating these barriers, namely the subtlety of the factors that contribute to them. Indirect forms of discrimination are difficult to counter because they cannot be directly addressed through antidiscrimination legislation or institutional reforms. Although these measures are important, none of them can fully succeed, because –the heart of the problem relates to the way that cultural-based attitudes that pervade political culture and society more generally intersect with one another and, consequently, conflate the barriers encountered by women. Breaking through the gender wall of barriers requires disrupting the subtle, indirect forms of discrimination, not just the overt forms. As such, the political participation of women is a whole-of-society issue and needs to be tackled in these terms.

G

# Gendered Politics in Turkey

Fatih Keskin
Faculty of Communication, Public Relations and Advertising, Ankara University, Ankara, Turkey

## Synonyms

Gender mainstreaming; Gender relations; Gender system

## Definition

Gender, different from sex, or being biologically male or female, manifests itself in a person's social and psychological characteristics. Inequality is a neutral concept, used by socialist tradition like repression or subjugation, which for is ineffectual, but which ultimately replaces the ideas that symbolize rebellion against the power/government. It is claimed that gender is determined by cultural, religious, and ideological norms and the existing society, and it is not defined by birth, and thus it can be changed by the very same society. Today, the dominant "gender mainstream" is criticized for integrating the women organizations into the system without transforming the patriarchal institutions, so feminist theorists of the socialist tradition prefer "gender relations" and "gender orientation."

## Introduction

Like "social problem" and the "national problem," the "women's problem" is regarded as one of the most significant political movements in the second half of the nineteenth century. This movement and its politically active women have long headed for three spheres: the education of girls and young women, the improvement of admission criteria for higher education, and the right to have professions, participating freely in work life and joining politics with equal rights. The first women's movement struggled in particular to ensure that all the rights declared by the French Revolution also apply to women. The failure to keep the promises of equality triggered the second women's movement, and oppressive practices applied on women led to the dismissal of institutions. The point is to bring out the positive traits of being a woman and achieve social transformation by making them a norm, rather than solely aiming at equality in the existing gender-based systems. The third wave of women movement, which was shaped by the postmodern thought, focused on homogenization of women through differentiation and subjected the distinction between sex and gender to deconstruction.

The viewpoint on the concepts of state and democracy also changed during this process. New women movement commenced in the 1970s by directing its criticism toward the limited capacity of formal democratic institutions with regard to equal rights of men and women to social resources. The state was defined as the "headquarters" of patriarchy and its institutions as power mechanisms of formal democracy that subordinate women to men. In the 1980s, attention shifted from government and democratic institutions to the fields of work, family, education, socialization, and law. From the 1990s onward, gender issues have become more prevalent in state and democracy theories. While one group maintained the critical state traditions, Anglo-American and Scandinavian philosophers have drawn attention to the elements of state policies encouraging women (Genetti 2003). Today, people are skeptical about approaches that render totalitarian government institutions. Therefore, considering them as the intensification of societal conflicts is also welcome, which entails Eva Kreisky's such arguments as "masculinity as a system" or "politics as men's unity" (Kreisky 2000), as well as Birgit Sauer's statements that the state is not only the "executive board" of men, it does not have a "monolithic structure" and that it also involves gender conflicts (Sauer 2009).

Much has changed in gender relations since inequality was placed onto the agenda, e.g., acknowledgment of constitutional equality of genders by the state, or elimination of the existing disadvantages, reform of family law, initiation of equal opportunities officer, quota practices, or encouragement of women in certain fields. Furthermore, gender mainstreaming offered alternative ways to eradicate the present inequality between genders (European Parliament 2003).

Nevertheless, despite these positive developments, it is pointed out that gender-based designs have remained in organizations, social relations, and rules. These findings point to the fact that "gender system" (Kerner 2007; Haug 2010a, b) is still the current practice (Meissner 2008). The government's role in the determination of normative gender roles and orders has in a way been confirmed. In other words, state policy's generation of specific gender relations and discrimination; their tendency to employ discourse, institutions, and practices justifying gender identities and inequality; and the way these policies define the boundaries between public and private space have been disclosed.

In Turkey, similar to other countries, gender has been a determining factor in the regulation of social relations and the establishment of social hierarchy in economic, political, and cultural areas. This, in turn, causes the traditional problems of capitalism and patriarchy to recur in the analysis of social reconstruction. In this recurrence, the basic assumption is that the problem is not only economic but also social, and the general guidelines are formulated by governments. In retrospect, the constituents of this problem in the political history of Turkey are generally as follows: ideological differences, attempts of political power/governments to idealize certain gender stereotypes, or the conditions set forth by

cooperation organizations such as the EU. What is more, although the policies in this field expanded some freedoms and increased the visibility of women in the public sphere, it also brought about various democratic paradoxes by, at the same time, disregarding endeavors for gender equality and somehow disseminating patriarchal sexist norms.

## Top-Down Modernization and State Feminism

Women's movements and related demands were reflected in the Ottoman Empire at the end of the nineteenth century in the form of claims for education, voting rights, and citizenship. Women prepared leaflets, wrote novels, sent letters to journalists, published their own journals, participated in discussions with men, and founded associations. Although change was supported during *Tanzimat*, conservativeness in terms of women rights was maintained, and Ottoman values were preserved through women. This has further increased the control and influence of the state on women (Berber 2017).

Experiences of Balkan Wars and World War I politicized and encouraged women. Women gained the right to study at universities and work at government offices and factories. With the Ottoman Family Law Degree dated 1917, Muslim women, as well as other congregations, benefited from developments, restricting polygamy and recognizing the right to divorce.

The Republican period and the process of nation-state building is the turning point in the formation of female identity. In this period, sex was attached a central role in national discourses and in the modernization projects of the nation state. The policies of the republican period were described as a "state feminism," which had developed toward the improvement of women's legal status and provision of their political rights (Tekeli 1991; Binder et al. 2015). There were so-called attempts to draw a contemporary image of woman during the governance of bureaucratic elite and in the leadership of a charismatic leader, who sees himself as the father, teacher, and governor of the nation at the very top of the political system. These efforts were conceived as symbols of demands for modernization and enlightening (Kreile 2012). However, it was pointed out that women were still defined, first and foremost, inside the house despite the reforms, their position has not gone beyond being the biological producer of the nation, and they were appointed the mission of reconstructing ideological collectivity; thus that "gender discrimination" was resolved with the Republic was indeed a created illusion (Berber 2017).

## Women Rights Policies from the 1980s to 2000s

The formative initial years of the republic have had far-reaching effects on the dynamics of gender politics. Most remarkable are the exaggerated notion of state, masculine quality of the government, gender equality policies which are generally led by the governments, restricted existence of women in politics, and differentiation of career opportunities for women in this field, less inclusion of women in structural decision-making processes, and, last but not least, subordination of women politicians to their men counterparts by the media. It is possible to notice the elements of the paradox Carole Pateman eloquently summarizes: women are "included into and excluded from" the political order "right because of having the same qualities and competences" (Pateman 1992). Although this paradox is especially evident in the political scene, it has had reflections on different areas.

Starting from the 1980s, Turkish society has gone through a profound and dazzling transformation. In neoliberal restructuring period, which goes far beyond solely being an ideological rhetoric, the state approached some demands of women positively, yet it continued paternalist policies toward them. On the other hand, after a delay of 10 years when compared to the West and at a time that coincides with when the world politics is shaped by a new liberal/conservative ideological wave, new women organizations generated policies not over equality and freedom but policies

that call for identity and culture recognition, which would also influence the years to come (Serpil n.d.).

Women's movement and politics of the 1990s was shaped by on the one hand the crisis of Kemalist modernization and on the other hand the rise of ethnic and conservative politics. It was stated that Kemalist modernization, which was owned as historical heritage, led to a closure in terms of women's rights in Turkey and turned out to be inadequate and authoritarian. Besides the patriarchal ideologies that penetrated into the public view in Turkey, the women image attached to women by Kemalist community projects and Turkish nationalism and republican modernization projects were criticized in terms of gender roles. Women, who were active in their own organizations in the beginning of the Republic, disappeared from the stage between 1935 and 1980, which has been associated with the state feminism. The rise of ethnic and conservative politics reduced "advocacy" of women's rights from improvement of gender relations to defend secularism. This led to a break in relations between women's organizations and institutions advocating women's rights and separation of the women's movement in itself.

## Women Rights and Family Policies

The ongoing years of the new government, which started in 2002, have also begun a different era in terms of women's problems and politics. EU membership negotiations and the evolving civil society orientation have led to the period of political liberalization, and radical reforms toward true legal equality of women in terms of gender politics have been put into effect. In line with the Copenhagen criteria, positive steps have been taken toward democracy, human rights, and minority rights. These advancements have been widely appreciated in Turkey and abroad. Moreover, with the good governance concept, women organizations in Turkey have been enabled to cooperate with supranational organizations and implement their own projects by the help of new financial resources. However, stagnation in this endeavor and a slowdown in the reform process have been recent realities.

## Conclusion

The concept of gender and politics aims to analyze in particular the state's influence on establishing and sustaining normative gender roles and systems.

This influence cannot be attributed to a particular party or ideology, nor is it specific to a certain geography. Though with varying degrees, it signifies a general and universal problem. This process is unique in Turkey in that the gateway to women rights and gender issues doesn't seem to be wide enough.

# Gendering the Workplace Injustice: Cliff or Prison

Abdulfattah Yaghi
Department of Political Science and Public Administration, Center for Public Policy and Leadership, United Arab Emirates University, Al-Ain City, United Arab Emirates

## Synonyms

Invisible barrier; Obstacles facing women, Male-Female workplace relationship; Role of gender in leadership

## Definition

Glass Cliff refers to a metaphor that describes the difficulties which women in leadership may face before, during, and after they are hired. Glass cliff suggests that men put women in peculiar positions making it difficult for women to succeed.

## Introduction

In spite of the legal and institutional developments that improved the workplace environment during the past 100 years, injustice inside organizations remains an undeniable reality that affects both men and women (Yaghi and Yaghi 2013). Workplace injustice is not limited to lower-level jobs, but men and women leaders (e.g., managers, CEOs, and directors) suffer from various forms of discriminatory treatment (Stivers 2002; Yaghi 2016a). Economic, social, political, psychological, personal, and organizational factors may amalgamate in such a way that makes it difficult for leaders to succeed in performing their job (Yaghi 2016b; Yaghi and Yaghi 2014). Some literature argues that women, unlike men, are victims of organizational injustice especially the covert and indirect bias against women managers (leaders). Researchers used various metaphors to describe their perceived injustices, such as glass ceiling, glass walls, glass slippers, sticky floors, and glass escalators (Connolly 2004; Griffiths 2004). Research on those metaphors has increased significantly in the past 40 years supported by various feminist groups and more voices pushing for fundamental changes in the laws that governed employment and human resource management (HRM). Glass cliff is a continuation of the previous metaphors, which focuses mainly on the single factor of gender, thus gendering organizational injustice and blaming men in particular for it (Ryan and Haslam 2005). This entry discusses the flip side of the glass cliff and argues instead that the implied demonization of men and the overemphasis on gender may create an illusion, an equally harmful thinking that is a "glass prison" which regenerates the stereotypical views of women leaders and their success by implicitly claiming that women's success is predetermined by somebody else (i.e., men).

## Glass Ceiling and Glass Cliff

Glass ceiling is the oldest metaphor that describes the invisible barriers which organization members, such as people with certain age, race,

G

economic status, or physical abilities, and women may face. Originally this metaphor was initiated, per Frenkel (1984), by Marilyn Loden in 1978 and Gay Bryant aiming to draw the attention of decision makers to systematic discrimination that could not be documented. Later on, other researchers expanded the examination of glass ceiling reporting new forms of injustice at work. They branched concepts from glass ceiling such as glass escalator (Goudreau 2012), sticky floors (Booth et al. 2003), and finally glass cliff (Ryan and Haslam 2005).

Researchers in the glass cliff literature argue, explicitly or implicitly, that established systems and organizational culture disadvantage women leaders. Men orchestrate conspiracies to put women in difficult (e.g., risky, peculiar, unusual, dangerous, and uncertain) jobs where the chances for failure are preknowingly high (Gartzia et al. 2012). Because most of the glass cliff research comes mainly from western, Anglo-Saxon societies, such as the United Kingdom, the USA, and Australia, one may think that glass cliff can be peculiar to such countries (Yaghi and Alibeli 2013; Yaghi et al. 2007). In order to test the glass cliff argument outside western societies, the present entry relies on data collected from United Arab Emirates (UAE) where women achieve noticeable success in leading public and private organizations and live within a conservative social culture and liberal economic system (Yaghi and Aljaidi 2014).

## The Flip Side of Glass Cliff Argument

John Connolly (2004) and Julie Griffiths (2004) describe the injustice that some women face when performing leadership tasks as a glass cliff. Other researchers expand the examination of glass cliff metaphor by a series of semi-experimental and scenario-based studies (Ryan and Haslam 2005, p. 83). The dominant argument in mainstream glass cliff research is that the established system (e.g., laws, regulations, work ethos, organizational culture, and procedures) in various public and private sector organizations create discriminatory practices in staffing leadership jobs by specifically targeting women and recruiting them to lead organizations (departments and units) where work conditions and the prospects of the jobs are noticeably unusual and difficult (Ryan and Haslam 2005, p. 83). The established system does not treat men the same way as women are treated, which leads many women to have limited options at work. In particular, women leaders either spend extra physical, psychological, and personal resources to succeed in managing the unusual work conditions, or take a shortcut and quit. In both scenarios, women leaders are unnecessarily struggling to perform a task for which they are chosen based mainly on gender criteria.

While the argument of the glass cliff may describe workplace injustice in some organizations in particular cultures (i.e., Anglo societies), it seems that the argument overlooks well-documented evidence that women fail in performing leadership jobs because of many factors, such as personal, organizational, political, cultural, economic, and social. Therefore, the flip side of the glass cliff seems to insinuate almost entirely the opposite of what it intends to describe. Specifically, attempting to justify the failure of some women leaders by blaming men or the "established system" bluntly suggests that women managers are either super leaders (i.e., superheroes) who cannot fail or women managers are dependent on men who decide for them what jobs to accept. While being hero is obviously a naïve suggestion that cannot be entertained, the second one is highly suggestive. This entry argues that while the failure of some women organizational leaders can be a natural occurrence, it is not gender alone to be considered. Therefore, it can be proposed that:

***Proposition 1*** *While gender cannot entirely be overlooked, there are other factors that impact women in leadership and their success or failure.*

An important aspect of the glass cliff argument is the claim that patriarchal system dominates the workplace; thus, women managers are disadvantaged. Similar to other "glass" metaphor-based concepts, such as glass ceiling, the argument is already made that men dominates the workplace

decision-making processes; therefore, fingers are pointed to them (see, Al-Lamki 2007). An alternative reading of this argument suggests that focusing on men-women relationships reproduces gender stereotypes that hurt women themselves. In particular, blaming men for injustice that grows in the workplace creates the illusion of a "glass prison" that men target women. Believing that the destiny of women leaders and the future of their career depend on men's well can verily limit women and undermine their leadership capabilities (Sabharwal 2015). The glass cliff claims unnecessarily revisit the notion of think evil-think men suggesting in doing so that women leaders are helpless and men are evil wanting them to fail (Cook and Glass 2013). Contrarily, this entry argues that some men, as well as some women, want women leaders to fail, while many other men want women to succeed. Hence, it is proposed here that:

***Proposition 2*** *While some men are supportive of women's professional advancement, there are those who are not. The lack of some men's supportive behavior may be driven by jealousy, departmental politics, and personal and organizational self-interest.*

## Methodology

It is necessary for public administration scholars and practitioners to put theoretical arguments, such as glass cliff, into empirical testing. In order to do this, the glass cliff argument and the counter argument (i.e., the aforementioned two propositions) are analyzed using the triangulation of qualitative and quantitative methods. Specifically, in order to scrutinize the origins and the major theoretical developments of the concept, the literature on glass cliff which was published in the past 10 years was screened and analyzed. Then, two waves of in-depth interviews of 62 women (34 and 28 in the first and second wave respectively) were conducted with women holding leadership jobs in both public and private sector organizations within the UAE between January 2015 and October 2016. In order to ensure the validity of data collection, a team of male and female graduate students and professional researchers was formed and trained to perform the Internet literature search and the in-depth interviews. The interviewees were selected from successful and poorly performing organizations with job titles ranging from CEO to supervisor. The interviewed had a minimum of 3 years of experience in their current leadership positions, and their age ranged from 26 to 59 years old. Thematic analysis of the transcribed interviews revealed the following themes: speed of hiring process, difficulty level of tasks, risk level associated with the assigned tasks, role of gender in hiring, and role of men in women's professional life (see, Table 1).

## Analysis and Findings

### Flaws in the Literature

Research on glass cliff continues to grow. However, there is no yet a systematic or empirical analysis of the concept itself. In October 2016, the keyword "glass cliff" in Google Scholar produced 1600 entries. Because not all those entries were academic studies, this entry relied on analyzing the five major studies which combined had 58% of all the 935 glass cliff citations in Google Scholar.

In 2003, Elizabeth Judge (2003) wrote in *The Times* that British women managers (i.e., leaders) were responsible for the failure of their companies and therefore, women managers could not be given a leading role in the private sector. Two years later, Ryan and Haslam (2005) refuted Judge's claim based on their analysis of archival documents of the failed companies showing that blaming women was not based on accurate facts (p. 32). In 2006, Wilson-Kovacs, Ryan, and Haslam (2006, p. 676) claimed that glass cliff was a "widespread" in the organizational world despite the "unique abilities" which women leaders possess and hence glass cliff leads women to fail. In 2007, Ryan, Haslam, and Postmes (2007) relying on hypothetical scenarios have asked college students to choose a leader in each given scenario. The study concluded that glass

cliff mentality was persistent in the simulation! In 2014, Bruckmuller, Ryan, Rink, and Haslam (2014, p. 218) reported that despite the fact that men and women were automatically given different assignments at work, gender stereotypes have disadvantaged women – especially when the organization faced difficult times. In 2013, Cook and Glass (2013) reported little historical support of the glass cliff (p. 100) and argued that many other factors besides gender were responsible for disadvantaging women leaders. In 2015, Sabharwal (2015) reported that surveying American senior executive service managers revealed that socio-psychological factors could explain the happening of glass cliff.

Looking at the previous studies shows that until 2015 most of early glass cliff research was done using a small number of interviews or surveys. A small number of personal testimonials and many hypothetical scenarios were the origins from which the glass cliff generalizations have emerged. Because the data collection and data analyses suffer from validity issues, the authenticity of the findings could also have suffered poor inferences and generalizations.

Contrary to research traditions in social and management sciences, the glass cliff literature does not seem value-free because many researchers make gendered judgments about workplace injustice even before they analyze their data. For example, several studies start off by claiming that discrimination against women is factual (Adams et al. 2009). Instead of starting with neutral position until the analysis reveals the findings, it seems that some researchers put the cart in front of the horse, as to speak, by making emotional conclusions rather than fact-based. This is a major flaw that should be recognized.

While workplace injustice is a reality, the glass cliff research tends to overlook the importance of the interpretation of terminologies used. In the process of trying to convince their audiences that women leaders are being unfairly treated, glass cliff researchers seem to use accusative language that traps them in bad logic. Specifically, the very claim that women are "put" in dangerous, peculiar, or unusual positions can fairly insinuate that women are amenable to manipulation. Logically, if individuals (women) can easily be dragged into accepting any leadership jobs, such individuals cannot be considered capable, professional, or competent leaders. The dilemma here is that the glass cliff literature regenerates stereotypical views of women and helps portraying them as less competent than men, the ones who supposedly put them in peculiar positions (Yaghi and Antwi-Boateng 2015, 2016). The practical implication of this dilemma is to indirectly claim that women are inferior and dependent on men. Unfortunately the good faith in the glass cliff argument does not eliminate its strong insinuations about the vulnerability of women (Wilson-Kovacs et al. 2006).

The last flaw in the literature is oversimplifying workplace injustice. Instead of properly exposing the causes, forms, and victims of injustice, the glass cliff research overwhelmingly limits its scope to examining gender and the relationship between men and women in the workplace. Such narrow approach does not provide a valid or even a broad understanding of workplace injustice. Even when the research focuses on victimization of women, it does not seem to recognize important factors that contribute to the status quo other than gender and the old-new claims that men are responsible for discrimination against women. Because workplace injustice is the core issue, rather than gender, we may ask: does the glass cliff apply to others besides women, such as minority men, male and female managers who have physical disabilities, male and female managers from economically lower classes, men and women from different cultural, racial, age, professional, economic, and social backgrounds? The examination of workplace injustice should be broad enough to recognize the universal nature of it rather than one aspect of it (gender).

## Analysis of the Interviews

### Circumstances Surrounding the Appointment of the Women

Table 1 summarizes the thematic analysis of the interviews with sixty-two women leaders in

**Gendering the Workplace Injustice: Cliff or Prison, Table 1** Analysis of in-depth interviews

| Themes of interview questions | 1st Wave ($N = 34$) | 2nd Wave ($N = 28$) |
|---|---|---|
| Hiring process | | |
| women recruited from other organization | 11 (32%) | 7 (25%) |
| women recruited from the same organization | 23 (68%) | 21 (75%) |
| women were asked to give presentation as part of the recruitment process | 5 (15%) | 6 (21%) |
| Wait period | | |
| acceptable time | 32 (94%) | 17 (61%) |
| longer than expected | 1 (3%) | 3 (11%) |
| quicker than expected | 2 (6%) | 8 (28%) |
| Difficulty of the assigned duties: | | |
| duties are demanding | 13 (38%) | 22 (78%) |
| duties are relatively normal (balanced) | 21 (62%) | 5 (17%) |
| duties are easy | 5 (15%) | 1 (3%) |
| Risk of assigned work | | |
| comparable to that of male counterparts | 20 (59%) | 19 (68%) |
| could not be compared due to having no male colleagues in similar jobs | 12 (35%) | 9 (32%) |
| Role of gender in designing the job | | |
| gender has no role | 20 (59%) | 19 (68%) |
| not sure | 10 (29%) | 6 (21%) |
| gender has a role | – | 4 (14%) |
| Influence of men on female leadership | | |
| men are supportive | 27 (79%) | 23 (82%) |
| men are not supportive | 3 (9%) | 4 (14%) |
| men have an unclear role | 4 (12%) | 1 (3%) |
| Perceived role of men as conspirer to fail women | | |
| male colleagues and/or superiors do not conspire against women | 32 (94%) | 25 (89%) |
| male colleagues and/or superiors do conspire against women | 2 (6%) | 3 (11%) |

Percentages are rounded and indicated in parentheses

public and private sector organizations. The findings indicate that standard human resource processes and procedures were strictly followed in selecting women for leadership vacancies. Hiring committees were involved; therefore, the final decisions were not an individual act. Moreover, each committee was staffed by men and women in order to ensure that hiring decisions were merit-based and not gender-biased. As part of the hiring process, around 18% of the women gave professional presentations and over 71% of all women came from the same organizations; thus, they were familiar with the organizational environments that surrounded the new leadership position. When asked about their perceived length of the hiring process, over 77% of all women indicated an acceptable time for the hiring process. One can assume that an acceptable time means that there was no reason to believe that the selected women were over-scrutinized during the selection and appointment processes. Only 17% and 7% of the women perceived the hiring process shorter and longer than expected, respectively. Since the hiring process was time-adequate, over-scrutiny of the women does not seem possible.

A fundamental assumption of the glass cliff is that women leaders are assigned peculiar tasks (e.g., difficult-to-perform, risky). In order to test this, the findings in Table 1 show that 58% of the women perceive their work duties as demanding and 39% perceive them as relatively normal, while 9% says the duties are easy. Around 63% of them describe the risk associated with their

work as being comparable to that in their male counterparts' work. None of the interviewed women indicated that their work was riskier than that of the male counterparts. One woman said: "the work itself is intense and I have to be alert all the time (Department Chair)" another said: ". . .my male colleagues are always in a rush to have their assignment successfully completed. The same is with me. . .I really have never looked at this matter as though I am doing riskier assignments (Manager of Auditing Department)."

It was essential to ask each interviewee if she believed that being a female has influenced her hiring decision. Table 1 shows three types of responses: women who firmly rejected the idea that gender has influenced their appointment (63%), women who were not sure about the role of gender (25%), and women who indicated that gender might have influenced the selection and designing of their jobs (14%). In their narrations, most of the women asserted that even if gender was a factor in their hiring, the biggest factor was their merit. As an example of these narrations, one woman said:

> I honestly hate it when people strip me of my capabilities and attribute my success to my gender. . ..it was not my biological features that achieved all the profits my company gained every year during the past four years. It was not that which caused my company to expand from one branch to five branches in five major cities (President of a Business Company).

One final assumption of the glass cliff is that men target women and work covertly and overtly to fail them. In this entry, the interviewees were asked about the perceived role of men in their career and personal lives. Table 1 shows that 80% of the women perceive men as supporters, 11% perceive them as unsupportive, and 7% perceive men's role both ways. Most of the women perceive male superiors and colleagues as professionals and about 91% of them dismissed the idea that men have agenda to get them fail in leading their units or organizations. Table 1 shows that about 8% of the women think that men may conspire against them but also women cited other factors besides gender, such as organizational politics, rivalry with others including men, and jealousy. As an example, one woman explained:

> . . ..men and women often like to see their competitors and opponents fail. It is not about men and women. . .it is about surviving and proving yourself. I worked under a female supervisor before, and she did the impossible to fail me. . .but that was because she was afraid I could take her position in the future. . .men do the same. Do not tell me man and woman. . . it is person and person (General Director, public sector department).

## Conclusion

Researchers suggested that one new obstacle faced women in the workplace is the vulnerability to manipulation and continuous discrimination (i.e., glass cliff). The previous analysis confirms that glass cliff may have failed to properly examine the circumstances that surround women in leadership. There seem to be many social, cultural, political, and economic factors that were overlooked when blaming men for the failure of some women leaders. The analysis shows that demonization of men leaves negative impact on professional relationships between men and women in the workplace and implicitly portrays women is incapable leaders.

## Final Thoughts

As this entry proposes, the glass cliff research seems to continue capitalizing on the narrow notion of gendered injustice and that men conspire against women wanting them to fail. Therefore, think evil-think men way of thinking dominates the arguments and assumptions of the glass cliff. Over emphasizing the role of gender and demonization of men creates hence a glass prison, an imaginary prison that confines professional women and therefore limits their success in the leadership world. This is simply because glass prison does not recognize merits or individual capabilities but considers instead gender as the sole determinant of organizational behavior and the life and progress of women leaders. Blaming men for possible failure of a woman in handling a leadership job serves as a pretext to justify workplace injustice and the poor organizational culture that restrict women's progress.

This entry presents a counterargument to the glass cliff showing that while gender might seem an important factor in leadership appointments, other factors may effectively contribute to the success or failure of women in their leading jobs. The empirical analysis and the analysis of the glass cliff research reveal supportive results to this counterargument.

An important dimension of women leadership that has been ignored in the glass cliff and should be examined in the future is the role of national culture and societal factors. Looking at the origins and the classic work on glass cliff, it seems possible that the whole phenomenon is country-based (e.g., Anglo societies) rather than a universal phenomenon. The analysis of the interviews provides strong evidence that nonwestern societies may not have conditions that enhance the development of glass cliff culture. The women cite not gender, but performance, professionalism, and merits as important factors in filling leadership vacancies. The women do not perceive men colleagues and superiors as a source of threat, but instead they cite jealousy, rivalry, and many other psychological and work politics as potential causes of making the work of women leaders more challenging. Instead of solving the real reasons behind the failure of men and women leaders, examining injustice, and broadening the scope of the concept of success, the glass cliff literature limits its endeavor to a gendered analysis. The mentality of think evil-think men can affect the organizational culture and the way women are being treated in the workplace.

## Giving and Volunteering

Gulnara Minnigaleeva
Department of Strategic and General Management, Department of Public Administration, National Research University Higher School of Economics, Moscow, Russia

### Synonyms

Charity; Community engagement; Donating; Philanthropy; Voluntary participation

### Definition

Giving and volunteering are actions of providing support to people or a cause by free choice and for no explicit compensation. Such assistance may be rendered in the form of some material assets such as money, food, real estate, and other things or by giving time, skills, and labor. The latter is called volunteering.

### Introduction

Volunteering and giving have been interwoven into people's lives since ancient times. Both phenomena are quite diverse, multifaceted, and manifest themselves in a broad range of activities. For example, giving alms to a beggar, donating funds to a nonprofit organization, or bequeathing a mansion for a children hospital are all acts of charitable giving. Giving time, or volunteering, is also a multifold phenomenon and may take different forms such as helping neighbors to look after their children, or providing professional legal services to a nonprofit organization, or even rescuing children in war conditions. Areas that may become points of application for volunteer skills and time are numerous: social services, disaster relief, arts, culture, democratic movements, education, community safety, etc.

### Charitable Giving and Philanthropy

Charitable giving, or donating assets, was the basis for welfare provision in many countries before the welfare state appeared. It is still an important source of assistance in most countries. It can be realized privately, directly to a person in need or a cause, or via an agency – usually a church or another nonprofit organization. Nonprofit organizations then use the assets to provide goods or services to those who need them. Nonprofit organizations specially set up to accumulate funds and distribute them for particular causes are called foundations. Foundations differ by the primary source of their income – community, private funds, or corporations.

For wealthy people, starting a private foundation provides a meaningful way to ensure that one's name will live. It also helps to organize bequests and guarantee that the funds will be used for a certain purpose (Adloff 2009). It is not only the wealthiest people, who make donations. Surprisingly, research finds that size and frequency of donations are not directly related to a person's income (Tonin and Vlassopoulos 2016).

In the corporate world, giving, as well as volunteering, is realized as a part of corporate social responsibility. Major motivations here, besides personal motives of the managers, can be those that optimize output of giving for a corporation itself. For example, findings show that giving to philanthropy by financial institutions in Bangladesh is associated with institutional, more stable, investors (Bose et al. 2016). Charitable activities may enhance a business's reputation, improve the recreational or other facilities in the community, and therefore increase workers' satisfaction without raising their salaries. Donations to

a research institution in the long run may contribute to a supply of better educated workforce. Managers may decide to give because of the so-called warm glow phenomenon. Fundraising efforts and tax exemptions are also instrumental in encouraging large corporations to donate to charitable causes (Bassi et al. 2014).

Corporate and private foundations are often associated with philanthropy, which unlike simple charity does not target specific population or concrete needs, but rather aims to advance humanity at large.

## Formal and Informal Volunteering, Pro Bono

Volunteering may be performed by an individual on his or her own, together with an informal group of like-minded people (informal volunteering) or in a formal setting, in an organization (formal volunteering). For example, an informal volunteer helps an elderly neighbor with the house chores, whereas a formal volunteer participates in a specifically organized program in an elderly care home.

Formal volunteering may be organized by civil society organizations, public agencies, or even businesses. In public or civil society organizations, volunteers may assume a broad range of responsibilities. Volunteers may be invited to help with maintaining organizational capacities by fulfilling everyday operations such as required paperwork or to provide professional legal or accounting services.

Volunteers may be a part of a professional team in a specific charitable program. For example, a doctor or a teacher may volunteer in a program targeting children with special needs. A person with no specific education may also participate in a program as volunteer. Usually he or she will receive specific program-related training or at least detailed instructions on his or her responsibilities. In case if professional service is provided by highly qualified individuals at no cost, it is called pro bono service.

Formal volunteering is more common in the countries with democratic values and well-developed nonprofit sector, whereas informal volunteering more often occurs in the countries which have gone through the experiences of socialist regimes. Persons engaging in formal volunteering appear to be more educated or more religious. Participating in one kind of volunteering does not entail not participating in the other type (Taniguchi 2012). In the countries, where state provides most social welfare services, cultural and artistic types of formal volunteering tend to be more significant (Salamon and Sokolowski 2001).

## Cultural Differences

Volunteering as a societal phenomenon exists in every culture. Individuals, who become volunteers, are usually also active in other related activities aimed at some common good. For example, many volunteers are also regular donors and are engaged in community building. Ubiquitously volunteers are more involved in church activities, membership associations, socializing through networks and are more often engaged in political activities than nonvolunteers. However, culture may determine perceptions of volunteering and giving, attitudes towards it, most common forms of volunteering, and dominating motives for making decisions to volunteer or donate funds.

For example, students from countries with high level of individualism are more motivated by opportunities to build a resume than students from countries with lower level of individualism (Grönlund et al. 2011). For the USA volunteering is a cornerstone of democracy and self-organizing, for Germany it is more about communal service for the public good. In some former socialist countries like Russia volunteering was compulsory before the change of regime, and nowadays they are experiencing renaissance of different forms of volunteering, despite that it may be difficult to instill the whole idea of volunteering as a free choice activity. In African countries, informal volunteering is a part of normal village life and is deeply rooted in the local culture (Salamon and Anheier 2009). In Islamic countries, giving is embedded in the religious

rules, whereas in Scandinavian countries it is almost nonsense that someone has so much more money than others that they can donate it. Political and economic conditions are found to contribute to levels of volunteering. For example, increasing public expenditure, government support for democratization, or higher levels of political consensus decrease probability of volunteering. Economic instability also negatively influences volunteering rates (Hackl et al. 2012).

## Economic Significance of Volunteering

Volunteering and giving are also an economic phenomenon. Volunteers provide various services to community and nonprofit organizations, which in turn provide services to other people. Without volunteers, these services would have to be paid by the state or population. For example, 70% of paramedics in Germany are volunteers and 87% of the US fire departments are operated mostly by volunteers (ibid.).

## Theories

Researchers have tried to understand the underlying reasons for giving and volunteering, which seemingly do not bring any benefit for a giver. For example, Menchik and Weisbroad suggested explaining volunteering by a p*ublic goods model* and *consumption model* (ibid.). The former assumes that individuals volunteer to increase total supply of the public good. Public good benefits are nonrivalrous and nonexcludable; therefore, volunteers benefit from the total supply of the public good. The latter suggests that volunteers receive benefits directly from the process of volunteering. For example, they feel satisfaction from doing the work they like or feel satisfaction because by doing good they prove being good, worthy persons. This phenomenon is also known as the "warm glow." Understanding of the public good they create does not influence the decision to volunteer.

*Social capital theory.* Putnam (1993) considers social capital a fundamental driver for volunteering. Social connections and shared values facilitate resource availability and trust. Volunteering is both a mechanism and result of social connectedness and trust (Stone and Hughes 2002).

*Human capital theory.* Human capital includes all forms of resources which may bring income and other useful outputs. In order to engage in volunteering, an individual needs to possess affluent human resources, which would be enough not only for survival but for performing extra activities (Wilson and Musick 1999). Warburton and Stirling (2007) indicate the following human resources as essential for volunteer engagement: health, level of education, special skills, and income level.

*Exchange value benefit theory* (Ziemek 2006) *or investment theory* suggests that a volunteer increases his human capital by acquiring new skills, networking, or receiving training. Contrary to this theory Freeman argues that organizations search for volunteers with already high human capital, who are productive and feel obliged to do something when asked. A typical volunteer is employed, well educated, married, and has children and high income (cit.by Hackl et al. 2012).

## Predictors of Giving and Volunteering

Empirical research based on theoretical models described above allowed identifying which circumstances may be determining individuals' participation in giving and volunteering. There are three groups of factors: *personal socio-demographic characteristics, human capital factors, and social capital factors*.

*Personal socio-demographic characteristics. Age* is considered to be a very strong predictor of volunteer participation. Multiple researches have demonstrated that during life course volunteer engagement is quite stable, it somewhat increases in the early old age (55–69, stage of empty nest and recent retirement, or decrease in working hours) and drops drastically after the age of 75. (Verbrugge et al. 1996). *Gender* research shows that women

generally participate in volunteer activities more frequently than men (Brudney and Lee 2012). *Race* appears to play an important role as well. Even though racial differences are reported in volunteering patterns in the USA, they may be attributed to the differences in human or social capital (Wilson 2000).

*In the group of human capital factors, health* is an important personal resource, which obviously has an effect on a person's ability to volunteer. It is worth mentioning that a decision to spend resources on volunteering may be based not on objective state of a particular resource but rather on the subjective self-evaluation of this resource. *Education* has been reported as a reliable predictor of likelihood of volunteer engagement. According to Brudney and Lee a bachelor's degree positively affects formal volunteering, but not the informal engagement (Brudney and Lee 2012). *Income* is often considered to be a negative predictor of volunteering as higher income means higher opportunity cost of volunteer hours; however, there is also the contrary data showing that higher income is a consistent positive predictor of volunteer participation.

*Social capital factors*. *Employment status* has a vast influence on forming of social networks and is a positive predictor of volunteering. *Marital status*. According to social capital theory married couples are more likely to be involved in volunteer activities, as they have large combined social networks of two spouses. Research shows that married people are more likely to volunteer than unmarried individuals (Sundeen 1990). *Parental status*. Parents are often involved in activities of volunteer associations in schools, parents, who chose not to be employed because they want to spend more time with their child will also have more time for volunteering (Wilson 2000). *Community type*, i.e., *rural or urban, and size of the community* may be influencing social networks, resources availability, and therefore be predictive of volunteering. Researchers demonstrate controversial results, i.e., Smith (1994) stated that cities are less favorable for volunteering; however, it has not been confirmed by the Census data in the USA. In Russia, informal volunteering seems to be more common than formal one, and organizations are more common in larger cities.

At individual level, decisions to volunteer may also be influenced by personal experiences. Very often the initial decision to volunteer or donate to a particular cause is determined by personal difficulties or sympathy to another person. For example, former cancer patients may volunteer for a cancer treatment society or parents of children with disabilities start a volunteer association. People give to charities more willingly when they possess enough information and trust the reputation of a particular organization. Television, printed media, the Internet, or word of mouth are major sources of information in this case. Different fundraising strategies, adding emotional content to informational materials, may influence the decision on the recipient and size of donation (Zarghamee et al. 2014). Donors often choose a particular cause they are willing to donate to and follow their decision even when other types of charities increase their fundraising efforts (Meer 2017).

## Effects of Volunteering

Participation in giving and volunteering are believed to produce positive effects on the society and on individuals, both givers and recipients (Wilson 2000). For example, volunteers tend to contribute to citizenship. They are more politically proactive as they are engaged in organized activities and possess special civic skills, such as skills on how to organize a meeting. For the young volunteer, engagement is important because it prevents them from being involved in antisocial behavior, exposes to informal social control and supervision. Volunteering promotes physical and mental health. The effects are especially remarkable for older volunteers. However, in this case it is essential to keep the right balance of volunteer hours and rest. Spending too many hours on volunteering may, on the opposite, cause fatigue and burn out effects. Volunteering boosts self-esteem and self-confidence and is related to higher life satisfaction. It is also often seen as an opportunity for networking and learning.

## Costs, Effectiveness, and Social Impact

Volunteering, though unpaid, cannot be considered a completely free labor. Formal volunteering requires organizational resources to recruit, motivate, train, and retain volunteers, which therefore entails expenses for an organization. Moreover, volunteer programs sometimes make provisions for compensating expenses a volunteer bears during his work. For example, it may include meals, or transportation allowance. Given that volunteer hours also have value, it is possible to calculate economic effectiveness of a volunteering program. A volunteer hour may be assigned either a market value of a similar service or a value of leisure activity that a volunteer could have been engaged in otherwise. Economic effectiveness then may be calculated as a difference between the resources saved and expenses for administrating the program. There are also other methods of calculating volunteer effectiveness. For example, method of social accounting attempts to recognize intangible benefits of volunteer work.

## Conclusion

Giving and volunteering are important societal phenomena. They are multifaceted and culture specific and have been known since ancient times. Charitable giving may be realized privately or via an organization. Nonprofit organizations specifically set up for accumulating resources for charitable purposes are called foundations and may have different sources of funding, such as community donations, private funds, or corporate funds. Starting a private foundation for wealthy people has become a popular way to ensure the meaningful use of their fortunes. In many business companies nowadays philanthropy and organized employee volunteering constitute a significant part of corporate social responsibility.

Some of the modern theories, which scientists have developed trying to understand the phenomena of giving and volunteering, include public goods model and consumption model, social capital theory, human capital theory, and exchange value benefit theory also known as investment theory. In accordance with the social capital theory, it appears that such personal characteristics as employment status, marital and parental status, community type, i.e., rural or urban, and size of the community influence a person's participation in volunteering and giving. According to human capital theories, such determinants include health, education level, and income. Other personal socio-demographic characteristics such as age, gender, and race may also influence the probability of a person's participation in giving and volunteering. At individual level among other circumstances, personal experiences, information availability, and reputation of a particular organization appear to be important for a person's decision to volunteer.

A person may engage in volunteering informally or in an organization. In both cases, it appears to have a positive effect on a personal well-being of the volunteer. At the societal level, volunteering contributes to citizenship by creating special skills and environment and to economy by providing services or goods, which would otherwise have to be paid for. Formal volunteering also has its costs for an organization, because of the staff time and resources used for organizing volunteer programs. Economic effectiveness and social impact of volunteer programs are not straightforward and are quite difficult to measure objectively.

# Global Administrative Reforms

Rajesh Sharma
Justice and Legal Studies, RMIT University, Melbourne, VIC, Australia

## Synonyms

International Jurisdictional Reorganisation; International Transformation of policy making; Regulatory Improvements in the World; Universal Regulatory Standardization

## Introduction

Globalization has been mostly viewed from an economic perspective. However, the impact of globalization on judicial administration has not been considered with the same vigor.

I would like to thank Professor Charu Sharma of Jindal Global Law School, India for giving her valuable comments and suggestions on the draft.

Globalization has no doubt contributed in the economic development of countries at the same time economic exchanges at the global level have also contributed towards globalization of dispute resolution system, which has been used by private as well as state parties. The one classic example is the creation of the World Trade Organization (WTO), which has created one set of trading rules, which must be followed by all Contracting States. If domestic rules of a particular country are not in line with the WTO rules, then that country is required to amend or legislate its law or regulations in line with the WTO rules. Such consistency with the WTO rules must be followed even when new laws, rules, or regulations are made in the future by any Contracting State. Any violation of the WTO rules may trigger the dispute resolution mechanism to resolve state-state dispute at the WTO forum. The dispute settlement mechanism of WTO is very effective because irrespective of the size of the economies, political power, or military power, the decisions or recommendations of the WTO dispute resolution body must be honored by the concerned State whose rules are found to be inconsistent with the WTO. Since its establishment in 1995, WTO and its dispute settlement body have been considered synonymous with globalization, which has had a significant impact on the judicial and administrative system of a country. One example is the administration of antidumping disputes, which are conducted and decided in accordance with the WTO rules.

As it is the States that are party to the WTO, the WTO dispute resolution system does not resolve disputes between private parties. Private parties, in general, use arbitration for resolving their disputes related to international trade and commerce. In this regard UNCITRAL Model Law on International Commercial Arbitration (Model Law), UNCITRAL Arbitration Rules (UNCITRAL Arbitration Rules), and the Convention on Recognition and Enforcement of Foreign Arbitral Awards (the New York Convention) set the international standards, which are followed by the domestic courts. In a dispute between an investor against a state, International Center for Settlement of Investment Disputes (ICSID) Convention together with relevant Bilateral Investment Treaty (BIT) is regarded as the internationally accepted standards. These international rules, law, and standards have created a significant impact on the administration of justice through courts or arbitration tribunals at the domestic level.

This paper will first highlight the importance of the Model Law, UNCITRAL Rules, the New York Convention, ICSID Convention, and BITs and how they set an international standard, which is seamlessly followed globally. In the next part, this paper will demonstrate how these rules and standard have affected, in a positive way, judicial and arbitration system including changes in relevant laws and practices in India. In conclusion this paper recounts the progress made in dispute resolution system so far in the Indian context and also suggests the necessary future developments required in this area.

## Global Rules of Dispute Resolution

In the domain of the dispute resolution by the private parties, the UNCITRAL Model Law on International Commercial Arbitration (the Model Law) and the Convention on Recognition and Enforcement of Foreign Arbitral Awards (The New York Convention) have played an important role in the globalization of dispute resolution rules. The domestic courts have consistently followed the New York Convention, which was signed in 1958, where a party approaches the court for enforcement of a foreign arbitral award. The grounds for resisting the enforcement of a foreign arbitral award serve as the outer limit of the power of the domestic courts during enforcement of that award. (Article V of the New York Convention enumerates grounds on which a court may refuse to enforce a foreign arbitral award. The court handling the enforcement of foreign arbitral awards is not allowed to reopen the case or judge the merit of the case again.) This is because the New York Convention has established global rules for the enforcement of foreign arbitral awards.

The Model Law has also helped to make the arbitration law a global one. Ever since it was first

adopted by UNCITRAL in 1985, the Model Law has created a global benchmark for an arbitration system to be recognized in the world. From an arbitration perspective, if a country adopts the Model Law, then it is considered as the "Model Law" country, which creates a positive image of that country in the mind of private business parties. From a government perspective, this fact is used as a means to attract foreign investment. A Model Law country satisfies the basic minimum criteria of noninterference by a domestic court in the process of arbitration; even if it interferes, that would be a positive interference, i.e., in support of the arbitration. In other words, if the Arbitration Law of a country is the same in the form and spirit as that of the Model Law, then that country is considered as an arbitration-friendly country. The principles of arbitration, as adopted in the Model Law, are accepted internationally both in common law and civil law countries. Thus, the Model Law guarantees that the domestic legal culture or traditions (i.e., common law, civil law, or continental law) have no effect on the process of international commercial arbitration.

Since 1976, UNCITRAL with its Rules on International Commercial Arbitration (UNCITRAL Rules 1976) has been promoting and handling arbitration proceedings in a way which is considered as a globally accepted standard. Its *ad hoc* arbitration rules have helped parties and countries to adopt such rules when they did not have or agreed to any institutional arbitration rules. UNCITRAL Rules in effect have provided everything what international arbitration institutions like ICC would have contributed in the administration of arbitration proceedings. Even before the Model Law came into play, the UNCITRAL Rules have been serving as the global standard of a fair and objective process of arbitration. UNCITRAL Rules have now been revamped, and the new rules have been in effect since 2010. As UNCITRAL Arbitration Rules are also used for the investment arbitration, therefore heeding to the new demand of transparency in the investor-state disputes, UNCITRAL Rules have now included the Transparency Rules in Treaty-based Investor-State Arbitration. (UNCITRAL Rules 2010 was revised in 2013 to include the Transparency Rules of Treaty-based Investor-State Arbitration. However, these transparency rules are not applicable on commercial arbitrations.)

In order to protect the investments of an investor in a host country, ICSID Convention was drafted which provides legal protection to an investor against a State which has unfettered power to regulate or acts in such a way that may be detrimental for the investors. (ICSID was established in 1966 by the Convention on the Settlement of Investment Disputes between States and Nationals of Other States.) ICSID Convention protects investors from such powers of the host government. A Contracting State of the ICSID Convention has to give consent for arbitration with an investor, and this is effected by the taking away the sovereign immunity of that State and make the Contracting State subject to the jurisdiction of the investment arbitration tribunal. A Contracting State, by giving up its sovereign immunity from jurisdiction of investment arbitration tribunal, agrees to a compromise in return to attract foreign investments and technologies for the development of that State. Because of that the host State is barred to exercise its sovereign immunity from the jurisdiction of the arbitral tribunal, and thus the investors could accept the standing offer of arbitration of that State anytime when they believe their rights in the Bilateral Investment Treaty (BIT) and/or Free Trade Agreement (FTA) are infringed by the host State. However, there are certain conditions that must be satisfied by the concerned investors before the State takes part in the arbitration with an investor. When an investor opts to initiate investment arbitration under a different forum, other than ICSID, then UNCITRAL Rules are generally used to conduct the arbitration proceedings to ensure that the arbitration process is conducted as per internationally accepted standards. (It is also possible to choose different institutional rules like ICC Rules, etc. in BITs.).

ICSID arbitration also pushed for advocating an open and transparent arbitration system. The argument, which was more forceful in the support of transparency, was a very simple one. If the subject matter of investment arbitration is a public law or the conduct of a State, then that arbitration must be public and not confidential like a typical

international commercial arbitration. The argument went on to emphasize that any investment arbitration with a State inherently involves public interests; therefore such arbitration should be open. Transparency has outweighed confidentiality, and now UNCITRAL has adopted Transparency Rules for Investment Arbitration, which has become part of the UNCITRAL Arbitration Rules but only applicable in investment arbitrations and not applicable on the commercial arbitrations. (See Article 1 (4) of UNCITRAL Rules 2010 as amended in 2013.) These transparency rules will help to understand and analyze the conduct of an investor as well as the actions of the host State. The decision of the tribunal will help comprehend the acceptable and nonacceptable conduct of an investor or a State. Moreover, the process of investment arbitration, earlier did not pay emphasis on public interests, has now become open to public to either praise or condemn the conduct of States as well as investors.

## Global Rules and Effects on the Administration of Justice in India

The arbitration law in India was in operation since 1940 through the Arbitration Act of 1940. The Arbitration Act, 1940, was based on an old idea where courts have the power and were capable of intervening at every stage of an arbitration proceeding. After the adoption of Model Law in 1985, India did not amend its arbitration law until 1996 to bring the arbitration law in line with the Model Law. (The Arbitration and Conciliation Act of India was promulgated in 1996, which was largely based on the Model Law.) After the promulgation of the Model Law in 1996, the government started promoting India as a Model Law country. However, in international quarter India was still criticized for not adopting the Model Law as it is and modified the Model Law to the extent that it lost the text and spirit of the Model Law to some extent. However, at least in law, the power of court was curtailed so that the role of courts was limited to positive interference in support of arbitration.

However, the less exposure of the Indian judges to the international commercial arbitration under the Model Law created the effect, which was neither intended nor expected by the Model Law. The situation became worse when the courts were asked to interpret the wordings of the Arbitration Act, 1996.

The first case on this point is relating to the number of arbitrators. (See Narayan Prasad Lohia vs Nikunj Kumar Lohia & Ors, Appeal (civil) 1382 of 2002, decided on 20 February, 2002, by the Supreme Court of India.) In Lohia v Lohia, parties agreed to a sole arbitrator. In the course of arbitration, they agreed to add one more arbitrator, thus constituting a panel of two arbitrators. (The Supreme Court did not comment upon the argument as to whether the two persons in this case were discharging the role of arbitrator or mediator, which was a matter of contention between the parties.) It is to be noted that the Arbitration Act provides that "the parties are free to determine the number of arbitrators, provided that such number shall not be an even number." (Section 10, Arbitration and Conciliation Act 1996.) Therefore, at the end of the arbitration, the losing party invoked the supervisory jurisdiction of the local court to set aside the award as it was not in accordance with the parties agreement, i.e., a panel of sole arbitrator and also the award rendered by two arbitrators were against the law which does not allow a panel of even number of arbitrators. The High Court followed the text of the law and set aside the award. The Supreme Court, however, rejected the decision of the High Court on the ground of party autonomy. The Supreme Court emphasized party autonomy and opined that it was also the agreement of parties to continue the arbitration with a panel of two arbitrators. Therefore, according to the Supreme Court, party autonomy is higher than the text of the law because arbitration is based on party autonomy. This would also mean that the composition of the arbitral tribunal was in accordance with the parties' agreement, and hence the ground of setting aside of award under Section 34 of the Arbitration and Conciliation Act cannot be invoked. (Section 34 (2) (a) (v) states "the composition of the arbitral tribunal or the arbitral procedure was not in accordance with the agreement of the parties." In this case the Supreme Court also opined that the objecting parties did not raise any objection during arbitration, which meant that the party has

waived its right to object under Section 4 of the same Act.)

The second decision shows the ignorance of the Indian judges as to how international arbitration works. In Bhatia International v Bulk Trading case, two Indian parties opted for ICC arbitration, and the seat of arbitration was agreed to be in Paris. (Bhatia International vs Bulk Trading S. A. & Anr, Appeal (civil) 6527 of 2001, decided on 13 March, 2002, by the Supreme Court of India.) As per the acceptable practice within an international arbitration, the court at the place of arbitration exercises the supervisory jurisdiction. However the Indian court adopted a contrary view that, on a subject matter of dispute connected with India and the potential enforcement of award resulting from that arbitration also in India, an Indian court has the supervisory jurisdiction over arbitration between Indian parties. The Court stated that

> a proper and conjoint reading of all the provisions indicates that Part I is to apply also to international commercial arbitrations which take place out of India, unless the parties by agreement, express or implied exclude it or any of its provisions.

The Court thus rejected the connection between seat and supervisory jurisdiction of the court at the seat and considered that arrangement as sham to take away the supervisory jurisdiction of the Indian courts. Once again the text of the Arbitration Law played a crucial role in fueling the lack of understanding of Indian judges about the features of international commercial arbitration. (The Supreme Court also accepted the problem in text and stated, "Lastly it must be stated that the said Act does not appear to be a well drafted legislation. Therefore the High Courts of Orissa, Bombay, Madras, Delhi and Calcutta cannot be faulted for interpreting it in the manner indicated above.") This decision of the Indian court was heavily criticized internationally. This erroneous decision was in effect for almost 10 years. In 2005, in another case the Supreme Court reversed the earlier decision and brought the end to the uncertainty and restored the internationally accepted principle that the court at the seat of the arbitration has the supervisory jurisdiction. (Bharat Aluminum v Kaiser Aluminum Technical Services [Civil Appeal No. 7019 of 2005] decided in 2012.) As this decision is effective from prospective date, all cases that were decided before have still been left in lurch and are subject to the old decisions of the Supreme Court.

The courts in India have applied "public policy" quite widely that it is difficult to ascertain the content and grounds of applying this ground for setting aside of an award. The judicial decisions have swung from one extreme to another. In some cases it is even looked into the merits of the case, which is not acceptable in resolution of dispute through arbitration. It is to be noted that within international arbitrations, the Indian case of "Renusagar case" is cited as enumerating the criteria of "public policy," where a court could not enforce an award, but the recent decisions of Indian courts have created a crisscross puzzle of public policy that is not easy to fix. (Renusagar Power Plant Co. Ltd v. General Electric Co., AIR 1994 SC 860. This case was decided under the Arbitration Act of 1940, but the ratio of the court is still considered as a good law.) The decisions are also at odds with the views of the Law Commission of India (LCI). After the submission of LCI Report No. 246 on Amendment of Arbitration, the Supreme Court in India decided two cases on the ground of public policy, which were interpreted expansively as opposed to the proposal of the LCI. (The LRC submitted its Report 246 on August 2014, and then the Supreme Court decided two cases ONGC Ltd. v. Western Geco International Ltd., (2014) 9 SCC 263 and Associate Builders vs Delhi Development Authority, CIVIL APPEAL NO. 10531 of 2014, decided on 25 November 2014.) This led the LCI to draft and present a supplementary report on public policy. (As the approach of the Supreme Court was different from the LCI, a Supplementary Report No 246 was issued in February 2015 by the LCI.) Under the federal structure of India, High Courts in different states serve as the supervisory courts, and they are able to interpret and apply public policy differently. Therefore, both LCI and Niti Aayog in their recommendations have asked the government to control the interference of the courts in relation to arbitrations and more importantly while dealing with application of setting aside of an award. (The National Institution for Transforming India, also called NITI Aayog, was formed via a resolution of the Union Cabinet on

January 1, 2015. NITI Aayog is the premier policy "Think Tank" of the Government of India, providing both directional and policy inputs. While designing strategic and long-term policies and programs for the Government of India, NITI Aayog also provides relevant technical advice to the Center and States. Niti Aayog has replaced the old Planning Commission.) It has gone to the extent to suggest that courts ought not to deal with the cases, which have been challenged on the basis of public policy alone. The Model Law has provided the grounds for the setting aside of an arbitral award which is based on the New York Convention Article V. According to the Model Law, the court may invoke the ground of public policy whether or not the Party argues it. There is a general acceptable principle, which is also confirmed by the drafting history of the New York Convention and the Model Law, that the courts should adopt the narrow interpretation of public policy. As the courts of India have not followed such proposition, therefore the LCI and Niti Aayog have proposed that Indian courts should also give narrow interpretation to public policy. The amendment to Indian Arbitration and Conciliation Act added explanation with the following effect in Sec 34:

> Explanation 1. – For the avoidance of any doubt, it is clarified that an
>
> Award is in conflict with the public policy of India, only if, –
>
> (i) the making of the award was induced or affected by fraud or corruption or was in violation of section 75 or section 81; or
> (ii) it is in contravention with the fundamental policy of Indian law; or
> (iii) it is in conflict with the most basic notions of morality or justice.
>
> Explanation 2. – For the avoidance of doubt, the test as to whether there is a contravention with the fundamental policy of Indian law shall not entail a review on the merits of the dispute.

In the paper presented by Niti Aayog titled "Strengthening Arbitration and its Enforcement in India – Resolve in India," the Aayog has acknowledged that in order to make India as a place of "Resolve in India," the very first frontier to succeed is to streamline the governance framework of arbitration.

The erroneous decisions by the courts with respect to arbitration provided an urgent impetus to proceed with the amendment of the Arbitration and Conciliation Act of 1996. Moreover, the Model Law also got amended in 2006; therefore the new provisions of the Model Law were missing in the 1996 Act too, which were needed to be included. For faster and efficient arbitration, many institutions and countries have already adopted new rules or provisions such as emergency arbitration, which were missing in the Indian Arbitration Act. Therefore in 2015, India amended its Arbitration Act, which also corrected the text to avoid any misinterpretations of law, not in line with the internationally accepted principles.

The 10 years of delay in correcting the error set by the Supreme Court triggered another dispute, which was decided by the investment arbitration tribunal in the White Industries case. (White Industries Australia Limited and The Republic of India, Final Award, 30 November 2011) In this case an Australian claimant was seeking to enforce an ICC award. However, the respondent Indian company resisted the enforcement of the award. As the law was incorrectly applied by the Supreme Court earlier as discussed above, the enforcement case remained pending before the Supreme Court. The case, which reversed the earlier decision of the Supreme Court, Bharat Aluminum also had White Industry, as party to that case. (White Industries was also one of the parties in the case *Bharat Aluminum* case which ultimately corrected the legal position about the jurisdiction of the Indian courts over arbitration in a foreign jurisdiction as discussed above.) Since that case took 10 years to decide, White Industry started an investment arbitration case against the Indian government on the ground of "denial of justice" and "effective means for exercising rights and obligations." The ground of denial justice is a very strong one, and any positive award by the tribunal would mean that the judicial system of the country, which is subject to the denial of justice claim, is ineffective or has collapsed or become nonfunctional, where no justice can be expected from the courts in that country. In other words, the positive award on denial of justice will in effect infer that the third pillar of a legal system has

become nonfunctional. Thus, it would be a very negative message for the State as it means there is no justice available for investors. In the White Industries case, the investment tribunal was critical of delay in the courts of India, but it did not pronounce that such delay amounts to denial of justice.

The tribunal in White Industries decided that delay in enforcing an award by the Indian court is a violation of the "effective means" clause, which was not available in the Australia-India BIT, but was brought from India-Kuwait BIT, applying the Most Favoured Nation Treatment (MFN) principle. The delay by the Court did not allow the investor to exercise its right to claim its money under the award. In other words there was no "effective means" available for the investor to exercise its right to claim money in the award which violated the Australia-India Agreement on Promotion and Protection of Investments. As this paper is not focusing on the application of the MFN principle in investment arbitration, it may be sufficient to say that application of MFN principle in investment arbitration is not a settled issue.

The reaction of Indian government was stern because such investment arbitration award was tantamount as basically judging the courts and the judiciary of the country by a three-person arbitration panel. The then finance minister India Mr. P Chidambaram said "We have put Foreign Investment Promotion and Protection Agreement (FIPPA) on hold – because of two major legal issues: namely right of a foreign investor to sue a sovereign State in a commercial dispute, and jurisdiction." He made this statement in Canada on 15 April 2013 in reply to a question asked by Mr. Peter Sutherland. The Finance Minister further stated, "We cannot allow our highest court of the land to be subjected to any foreign courts or tribunal." He even asked Mr. Sutherland and the audience of Canada a rhetoric question in return "will you allow the Supreme Court of Canada be subjected to jurisdiction of any other court or tribunal?" The current government of India, though a different political party than the previous government, has also followed the same approach and proceeded to draft a Model BIT. It has consequently also issued notice to its current BIT and FTA partners (which includes investment provisions) for unilateral termination of BIT. Australia-India BIT is one of those BITs which has come to an end on 23 March 2017. Such termination of BITs means that the investments, which are protected through BITs, are no longer protected if those investments are made after the termination of the BIT. However, it is to be noted that every BIT generally has termination provision to the effect to provide the protection of BIT to investments already made before the termination of the BIT for another 10–15 years. In the case of Australia-India BIT, such protection is available for 15 years from 23 March 2017. Thus any investment made on or after 23 March 2017 will have no protection under the Australia-India BIT.

Investors may be jittery by the unilateral withdrawal of India from its BIT; the Indian government is convinced that the Indian legal system is robust enough to resolve any investment dispute which in the eyes of Indian government is simply a commercial dispute. The former Finance Minister (just one day after his statement in Canada), in his speech delivered at the Harvard Business School, stated "the best guarantor of investment protection is a stable and democratic political structure, a belief in the rule of law, and a transparent and independent legal system. India has all three. So have many other emerging markets." The same approach is also adopted by the current government, which is pushing its Model BIT as the template for negotiating all BITs in the future.

There is no doubt that White Industries award has nudged India to draft its own Model BIT. The first draft of Model BIT was extensively reviewed and analyzed by the LCI, and upon their recommendations, India modified its Model BIT, which is now serving as the template for BIT negotiations. India is the first developing country, which has adopted its own Model BIT.

The Model BIT of India has received some positive support in the international arena. Until now there were two model BITs prevalent, i.e., US Model BIT and the EU Model BIT; so now the Indian Model BIT is presenting a third model which is considered as the middle path. The

Indian Model BIT gives regulatory and policy space to State; therefore some host states have also shown inclination to follow the Indian approach in their negotiation of the BIT. Recently when EU demanded India to move away from its Model BIT, then few experts advised that India should stand strong in EU-India FTA negotiation. (Rob Howse, India should not let Europe undermine its new BIT and TRIPs flexibilities for medicines, Sunday Guardian Live|25 February, 2017, http://www.bilaterals.org/?india-should-not-let-europe).

## Establishment of Commercial Courts, Commercial Division, and Commercial Appellate Division

The inordinate delay in deciding a case by courts in India affected the intentional image of the Indian court system. Even in situations like White Industries where parties opted for arbitration, if they need to go to court in post-arbitration situation, the time taken by courts in resolving such disputes is incredibly long. It is pertinent to note that the White Industries invoked Australia-India BIT to get relief from such delays by the courts in India. According to the data collected by the World Bank, contract enforcement takes 1420 days (nearly 4 years), and the cost of enforcement comes around 40% of the contract claim. (This fact was noted in the Law Commission of India Report 253, p. 43.) Niti Aayog has also noted a study, which reveals that it takes 24 months to resolve challenges under section 34 (of the Arbitration and Conciliation Act 1996) at the lower courts, 12 months in High Courts, and 48 months in Supreme Court. In all it takes around 2508 days on an average to decide applications filed under Section 34.

This promoted the Indian government to enact a law concerning the establishment of "Commercial Courts, Commercial Division, and Commercial Appellate Division in the High Courts of India." The pecuniary limit of such courts is a minimum of Rupees One Crore (US$152,828). Commercial courts have already commenced functioning in Delhi, Mumbai, Himachal Pradesh, and Gujarat. (http://timesofindia.indiatimes.com/city/delhi/Commercial-courts-begin-functioning-in-Delhi-Mumbai/articleshow/52488068.cms.)

Commercial courts have jurisdiction of a wide of rage of commercial disputes such as ordinary transactions of merchants, bankers, financiers, and traders such as those relating to mercantile documents, including enforcement and interpretation of such documents; export or import of merchandise or services; issues relating to admiralty and maritime law; transactions relating to aircraft, aircraft engines, aircraft equipment, and helicopters, including sales, leasing, and financing of the same; carriage of goods; construction and infrastructure contracts, including tenders; agreements relating to immovable property used exclusively in trade or commerce; franchising agreements; distribution and licensing agreements; management and consultancy agreements; joint venture agreements; shareholders agreements; subscription and investment agreements pertaining to the services industry including outsourcing services and financial services; mercantile agency and mercantile usage; partnership agreements; technology development agreements; intellectual property rights relating to registered and unregistered trademarks, copyright, patent, design, domain names, geographical indications, and semiconductor integrated circuits; agreements for sale of goods or provision of services; exploitation of oil and gas reserves or other natural resources including electromagnetic spectrum; insurance and reinsurance; and contracts of agency relating to any of the above. Central government of India has the power to include other disputes of commercial nature other than what are already identified in the law.

Disputes such as exploitation of oil and gas reserve or other natural resources are mainly the subject matter of dispute in investment arbitration cases. The inclusion of electromagnetic spectrum is also included in the category of commercial dispute. This is perhaps when the Supreme Court of India cancelled the licenses issued by the Indian government for mobile telecommunication, which triggered few investment arbitration cases. (Centre for Public Interest Litigation and others vs Union of India and others WRIT PETITION (CIVIL) NO. 10 OF 2011, decided on 2 February

2012. After the cancelling of license, India was slapped with notice of Investor-State Treaty-based arbitration by various investors. See "Sistema threatens arbitration in 2G case." http://timesofindia.indiatimes.com/business/india-business/Sistema-threatens-arbitration-in-2G-case/articleshow/12070637.cms) Including such disputes in the category of commercial disputes fortifies the view of the Indian government that all investment disputes are mainly commercial disputes. However, the jury is still out which may not agree with the view of the Indian government.

One of the causes of delay in courts is the lack of enough number of judges. Though commercial courts have been established, they are running with the help of current judges. Such use of current judges may give a kick start to the commercial court, but it may not be helpful in speedy decision-making unless new judges are appointed as per the recommendation of the Law Reform Commission. The LRC suggested that only specialized judges or new judges with specialized training in commercial disputes should be given charged to resolve commercial disputes. These courts are also allowed to handle arbitration-related cases such as setting aside of awards and enforcement of awards. If these commercial courts could decide arbitration-related cases speedily, then situations like White Industries may not arise again.

## Institutional Arbitration in India

In the most jurisdictions, arbitration is generally administered by an arbitration institution whether as a governmental body or a professional body or as an NGO. The benefit of having institutional arbitration is that when parties have not agreed on any aspect of arbitration proceeding, then institutional rules may serve as the default rules. This is possible just by agreeing to use institutional rules in the arbitration agreement. Parties may also use UNCITRAL Arbitration Rules in their *ad hoc* arbitration; however it has been seen that institutional arbitration has many advantages over *ad hoc* arbitration.

In the last 20 years, though India has embarked upon making the arbitration a more acceptable mode of dispute resolution in India, the institutional arbitration has not acquired international recognition. In fact, arbitration institutes of India have been subject to scathing criticism. Even the Niti Aayog Report has criticized the current arbitration institutions and has recommended the government of India to work toward establishing an International Institution of international standard if India wants to promote "Resolve in India." In comparison to other hubs of arbitration like Hong Kong, Singapore, Beijing, Paris, and others, India is far behind, and there is need to establish a central arbitration institution with offices in other cities, e.g., Delhi, Mumbai, Hyderabad, Bengaluru, and Gujarat. Considering the size of India, it is important that the state offices of the central arbitration institutions are also open. ICC, SIAC, and LCIA have shown such ways which help parties in filing notices of arbitration and conducting arbitration proceedings including appointment of arbitrators. Suggestions of Niti Aayog, in this regard, are influenced by the practices of these international arbitration institutions.

## Innovative Appeal Mechanism in Arbitration

Arbitration is final and binding, and therefore courts cannot get into the merits of the decision. In this way power of courts is controlled vis-à-vis arbitration. However, this situation may also result into the wrong application of facts and law, which may create injustice. Therefore, it has been argued that there should be some sort of appeal mechanism, which may be helpful. It may be noted that in the Model Law, there is no provision of appeal, and even in jurisdiction like the UK, which has a limited scope of appeal, courts have been reluctant to allow appeal. (Article 69 of the UK Arbitration Act allows limited right to appeal against an award. However, courts in the UK are reluctant to grant leave to appeal against an award, which indirectly supports the finality of arbitral award. https://www.cliffordchance.com/briefings/2014/02/courts_reluctanttograntappealofarbitra.html) In investment arbitration the appeal system has picked up further momentum. EU-Canada FTA, (Relevant CETA provisions:

Article 8.27 – Constitution of the Tribunal; Article 8.28 – Appellate Tribunal; and Article 8.29 – Establishment of a multilateral investment tribunal and appellate mechanism) EU-Vietnam FTA, (Chapter 8 of EU-Vietnam FTA, Article 13, provides for establishment of Appeal Tribunal.) and Australia-China FTA (Australia-China FTA does not have any provision relating to appeal mechanism; however, as for the future negotiation, both Parties have agreed to discuss appeal mechanism. As stated in, ARTICLE 9.23: Appellate Review, "Within three years after the date of entry into force of this Agreement, the Parties shall commence negotiations with a view to establishing an appellate mechanism to review awards rendered under Article 9.22 in arbitrations commenced after any such appellate mechanism is established. Any such appellate mechanism would hear appeals on questions of law.") have opened the door for appeal mechanism in the investment arbitration.

The Supreme Court of India has recently allowed indirect ways of appealing an arbitration award, whereby parties may choose two arbitrations. (*M/s Centrotrade Minerals & Metal Inc. v. Hindustan Copper Ltd., Civil Appeal No. 2562 of* 2006 decided on 15 December 2016.) If the decision of the first arbitration is not acceptable, then the parties may commence second arbitration, and the decision of the second arbitration will be final and binding. As the Supreme Court of India has recognized double arbitration which may serve as an appeal mechanism with the parties' consent, such methods may be used by other parties in the future arbitrations too. This is an example where Indian approach may affect global governance of arbitration.

## Conclusion

Globalizations of dispute resolution rules have positively impacted the administration of justice in India. In this regard the Model Law is worth mentioning. The Model Law has helped develop the arbitration system in India. Many private parties have taken the benefit of arbitration whether as a domestic arbitration or as an international arbitration. The recent amendments in the Arbitration Law will further help India to establish itself as an arbitration-friendly jurisdiction. The establishment of commercial courts, commercial division, and commercial appellate division will help commercial cases to get resolved in a speedy way. More importantly these courts will supplement the development of arbitration system because arbitration-related cases will be dealt with by these courts also in a time-bound manner. Despite these developments there are several stumbling blocks. In the context of arbitration, it is important that India establishes a central arbitration institution with offices or branches in several parts of India. Without a centralized institution of arbitration, the practice of institutional arbitration will not develop, which will also affect the "Resolve in India" dream. The lack of judges for the new commercial courts is another problem. Commercial courts are also important to resolve investment disputes, which are, according to India, mainly commercial disputes. Therefore to avoid any further investment arbitration, these commercial courts must deliver decisions in a timely manner. The unilateral withdrawal of India from the BITs and insistence on accepting Indian Model BIT may create some resistance and may affect foreign investment. While foreign investors consider India as a profitable destination, at the same time they would like to have a legal guarantee for protection of their investments, which are generally granted under BITs. As long as the BIT system is not fixed, it is important for India to strengthen the arbitration and commercial court system so that investor finds solace in India with regard to availability of effective, efficient, and practical dispute resolution system.

# Global Agenda for Crisis Management

Michael Guo-Brennan
Troy University, Troy, AL, USA

## Synonyms

Crisis agenda; Crisis management; Emergency management; Global agenda; Global competency; Globalization

## Definition

The global agenda for crisis management represents issues not bound by national borders and refers to processes, procedures, and structures to effectively deal with a major event that threatens to disrupt or harm, either temporarily or permanently, an organization, its stakeholders, or the public at large and is of such a scale that it may

exceed the capacity of a single nation-state or region.

## Introduction

Crisis management involves processes, procedures, and structures to effectively deal with a major event that threatens to disrupt or harm, either temporarily or permanently, an organization, its stakeholders, or the public at large. The global agenda includes items that are of a scale that they may exceed the capacity of a single nation-state or region or represent an issue that is not bound by national borders. The scope of such crises on the global agenda may be relatively short term or may represent long-term threats to regional or even global stability. The global agenda for crisis management therefore represents a global effort to manage major crises that exceed the capacity or scope of the affected region. This chapter discusses the key elements that make up the global agenda for crisis management.

A crisis can come in many forms including ecological, economic, humanitarian, military, or political. It can arise from natural disasters such as tsunamis or earthquakes or as the result of human action such as terrorism or other conflicts. A crisis can result from civil war or as the consequence of the lack of basic sanitation. Crises present multiple, cross-cutting challenges that can threaten regional stability and with increasing frequency global stability. They can be of two broad types: a short-time crisis with the immediate impact centralized in a local or regional geography or a larger, existential threat with global implications. While the immediate impact of a short-term crisis may be acutely felt in the localized area, the long-term implications of a major event can have extended repercussions worldwide. This suggests there should be a global response to such events.

A global response suggests the need for a global agenda for crisis management to properly respond to, recover from, and mitigate such threats. Such a global agenda would include potential threats that would require a response from multiple countries in multiple regions. It includes challenges that are so complex; they require a collective and integrated approach. The global agenda involves threats that may affect multiple regions at the same time. These threats will change over time and will impact different regions of the world in different ways. Management of such crises requires cooperation in global governance efforts. Several examples in recent history demonstrate the need for a continuing global agenda to manage crises with global implications.

On December 28, 2013, a 2-year-old child died of Ebola in Guinea. Patient zero as he is also referred was the first of what was to be over 11,000 deaths in Guinea, Sierra Leone, and Liberia as a result of the Ebola epidemic that spread through West Africa in 2014. This Ebola outbreak demonstrates the consequences when insufficient attention is paid to a potential global health crisis. In addition to the more than 11,000 deaths, the outbreak resulted in 28,638 infections and an estimated economic loss of US $2.2 billion in the three countries most directly impacted.

The virus went undetected for nearly 3 months due to insufficient capacity in the region to monitor such risks. Once the outbreak was realized, it went largely underestimated. The World Health Organization (WHO) along with the governments of Guinea, Sierra Leone, and Liberia expressed confidence the Ebola outbreak could be managed by local officials. It was not until the epidemic was spreading and out of control that the WHO declared the outbreak a Public Health Emergency of International Concern.

Once this declaration was made, resources worldwide were mobilized. Unfortunately, insufficient resources were committed to the crisis. This included a lack of personnel with proper training and experience, inadequate financial resources, a lack of understanding of the scope of the needed response, low community engagement, and poor coordination among participating nations. These failures likely resulted in the deaths of thousands of individuals who could have survived had a global response to managing this crisis been implemented earlier (High-level Panel on the Global Response to Health Crises 2016).

Technological developments along with globalization have led to a world that is increasingly connected and regions that are increasingly interdependent. The interdependence suggests that a major and sudden event in one region of the world can have significant implications for other regions in the world. The March 11, 2011, earthquake off the coast of Japan demonstrates this new interdependence. The earthquake was among the most powerful ever recorded, measuring 9.0 on the Richter scale. While the devastation from such an event could be catastrophic, it was minor compared to the effects that followed. The earthquake triggered a tsunami with 30 ft. high waves which battered the coast of Japan leaving approximately 20,000 dead or missing. Within hours, the Japanese government declared a nuclear emergency at the Fukushima Daiichi Nuclear Power Plant due to the combined effects of the earthquake and tsunami which had cut electrical power to the plant and caused backup generators to fail. The government immediately ordered the evacuation of 60,000–70,000 people living near the plant. The lack of power led to overheating within the reactor cooling systems. Over the next several months, after at least three reactors at the plant experienced full meltdowns, thousands more were evacuated. Many expressed concerns about contaminated air, seawater, and debris from the earthquake. Much of the debris, taken by strong Pacific Ocean currents out into the ocean, began washing up on the shores of Alaska, Hawaii, and the Pacific Northwest in 2013. Although there are no reports of radioactive debris landing onshore yet, officials will continue to monitor the material as debris from the tsunami is expected to make landfall for years.

The repercussions of this disaster affected other regions around the world in other ways. The Fukushima Daiichi disaster led to dramatic changes in Japanese energy policy. These changes had substantial implications for other nations thousands of miles away. In May 2012, the Japanese government shut down all 54 of the nation's nuclear reactors. Soon several other nations shut down similar reactors. Germany began shutting down nuclear reactors almost immediately and announced it will abandon nuclear energy altogether.

At the time of the earthquake, 31.2% of the electricity supply in Japan came from nuclear power. The loss of this supply led to a dramatic increase in demand for fossil fuels, primarily natural gas. Since Japan imports nearly 100% of its natural energy consumption, these increased demands have implications on the world energy market as well as domestic and international energy security (Hayashi and Hughes 2013). In 2012, Japan was the largest importer of liquefied natural gas, the second largest importer of coal behind China, and the third largest importer of oil (behind China and the USA). In addition, the damage to Japanese infrastructure meant dramatic decreases in production including exports to other countries. While the disruption in the supply chain was short lived, lasting only a few months, the combined economic impact of reduced exports and increased imports of fossil fuels led to a record Japanese trade deficit in 2012 of $78 billion (Ferris and Solís 2013). Although in the short term and long term, the health risks and environmental damage will be felt most acutely in Japan, the global economic impact of such a natural disaster, the cleanup associated with potentially contaminated debris, and the resulting impact on energy security require global attention and a place on the global crisis management agenda.

Widespread disease epidemics and the complications of natural disaster are not the only issues that deserve attention on the global agenda for crisis management. Many of these issues have both short- and long-term implications. Threats posed by non-state actors and the plight of refugees remain an important issue on the global agenda. While long-term mitigation efforts may belong equally on the political agenda, short-term response efforts often require global partners. Long-term concern for access to valuable natural resources including energy resources and potable water is another important area of concern. Sustainable development and issues related to poverty reduction also require global attention. Each of these issues will be discussed in the pages that follow. While these issues may not be seen as acute events that require a quick and immediate

response, they do require global action to mitigate long-term and global consequences.

## Global Governance and Developing the Global Agenda

Developing such an agenda requires cooperation from nation-states around the world along with international nongovernmental organizations, the private sector, local and regional governments, and organizations that will serve as first responders and will ultimately implement mitigation efforts. This suggests that global governance itself is key to crisis management on the global scale. Some believe there has been a failure in global governance to adequately address these issues (World Economic Forum 2015a). At present, there is no binding international convention outlining the rights and responsibilities of governments following a disaster. Few governments are prepared with policies, procedures, or the structures to facilitate international relief efforts. The International Federation of Red Cross and Red Crescent Societies (IFRC) is actively engaged in developing and promoting a framework for such efforts. In 2007, the IFRC and signatory states to the Geneva Conventions adopted guidelines for the "domestic facilitation and regulation of international disaster relief and initial recovery assistance" (IDRL Guidelines). A year later, the UN adopted three resolutions encouraging governments to adopt these guidelines. These efforts are critical in the coalescence of nations around a global agenda for crisis management.

A number of transnational organizations are actively engaged in such an agenda. In addition to the IFRC and the United Nations, the World Health Organization (WHO), the World Bank, the World Economic Forum, the International Monetary Fund (IMF), the Organization for Economic Cooperation and Development (OECD), and the North Atlantic Treaty Organization (NATO) all place efforts to respond and manage global crises high in organizational priorities. The question remains whether these organizations have the capacity to develop cohesive structures for global governance in response to global crisis. They must work collectively with national and subnational partners to respond when crisis occurs and to mitigate disasters and other crises before they occur. Accomplishing these goals includes identifying areas of concern and lifting them to a place on the global agenda. This requires a singular global agenda and a cooperative and unified effort to identify and address issues and the capacity to manage such crises.

Recent crises that are generally agreed to be part of the global agenda and therefore require a global response include the global economic and financial crisis of 2008, the threat of violence posed by non-state actors against governments and religious and ethnic groups around the world, the ongoing effort to respond to climate change, and the spread of disease such as the 2014 Ebola outbreak in West Africa or the 2016 Zika virus outbreak.

## Financial Stability

As economies develop and nations become interlinked for economic development and success, global financial stability is of increasing importance on the global agenda. Two international organizations, the Group of Twenty (G20) and the IMF, are actively engaged in managing potential threats to the global financial system. The G20, an organization that includes 19 major economies along with the European Union, is an important player in lifting global financial concerns to the global agenda for crisis management. The G20 represents about two thirds of the worlds' population, 85% of world GDP, and greater than 75% of worldwide trade. As the connectedness between economies grows, organizations such as the G20 become increasingly important, particularly in the event of a major global economic crisis.

Perhaps one of the most glaring examples of the global implications of a crisis and the need for a global agenda to respond to such crises was the worldwide financial crisis which began in 2007. Years of growth, including record homeownership in the USA that resulted from deregulation in the mortgage industry, led to

dramatic rises in housing costs. The trajectory of growth was unsustainable and in late 2007, housing prices collapsed. This impacted the American financial system immediately, but soon spread to markets around the world. In addition to major elements of the American financial system failing, the American auto industry nearly ceased to exist. Stock exchanges around the globe saw huge losses, including the Dow Jones Industrial Average which lost 33.8% of its value in 2008. Unlike the immediate need for recovery after a natural disaster or violence by non-state actors, the damage caused by the global financial crisis evolved over time, had long-term implications, and continued to expand.

By the end of 2008, the USA, Germany, Japan, China, and a number of smaller countries were in recession. A variety of factors contributed to these losses, all stemming from the new global interconnectedness of today's economies. Foreign investment in American real estate led to dramatic losses and recession in countries throughout Europe. Worldwide recession reduced demands for exports from Japan, China, and other developing economies which drove these nations deeper into recession.

The G20 member nations met in November 2008 to develop a response to the failing global financial system. Their first goal was to stabilize global financial markets through increased IMF funding to support the most affected countries. The organization also promoted macroeconomic stimulus programs and a strengthening of regulatory and supervisory systems. While each of the individual governments also implemented reforms, the ability of the G20 to respond to this crisis from a global perspective demonstrates the importance of maintaining systems and structures capable of addressing the global agenda.

In addition to efforts by the G20, the IMF responded to the global financial agenda and the global economic crisis by issuing a series of policy recommendations for member states in its Global Policy Agenda in 2012. In addition to making recommendations to stabilize the ongoing recovery and to mitigate future economic threats, the statement outlined the IMFs' role in assisting nations in recovery and prevention efforts. Through an approach that recognizes there is not a "one-size-fits-all" solution, the IMF continues to develop programming that will aid in recovery in both developed and developing economies.

## Civil War and Threats from Non-state Actors

The breakup of the former Soviet Union and the end to the Cold War were thought by many to usher in an era of sustained peace and reduced global tensions. However, in less than a decade, global tensions rose quickly with the spread of violence by non-state actors, highlighted by the attacks on American cities on September 11, 2001, and in similar attacks in the UK, Spain, Indonesia, and elsewhere in the immediate years that followed. These non-state actors use fear and violence against modern, open, post-industrialized societies as a means to promote either religious or political goals. In response to these threats that often originate from highly organized non-state actors, who use technology to spread their message and avoid detection, governments have established national institutions such as the American Department of Homeland Security. International efforts focus on governments working collectively to mitigate these threats. These organizations work collectively in the short term to respond following an attack and work to prevent future threats.

Each year, the World Economic Forum publishes a report identifying the most significant global risks to world order. The report considers a wide range of threats that are likely to become global crises in five categories including economic, environmental, societal, geopolitical, and technological. The 2015 report identifies 28 global risks that if not addressed may lead to significant negative consequences to several countries or whole industries within the next 10 years. *Interstate conflict* is the number one global risk for the third year in a row. Issues related to governance and the growing connection between geopolitics and economics also rank high on their global crisis agenda (World Economic Forum 2015b).

Today, it is estimated that more than 15 million refugees have fled their home country due to civil

war and violence. This remains a global problem as refugees, primarily from war-torn nations in the Middle East and Africa, seek safe harbor primarily in Europe and North America. The ability to manage the refugee crisis requires global cooperation. Compounding this issue is fear from the citizenry from many host countries that non-state actors will pose as refugees to infiltrate host countries and spread violence and hatred. This has led to calls in some nations to end or reduce the intake of refugees. Humanitarian calls to manage the refugee crisis from the United Nations and several developed countries demonstrate the importance of this issue on the global agenda.

## Long-Term Crisis Management

Many crises such as illness and epidemic, natural disasters, or the threats imposed by violent rogue actors require immediate action to recover and respond; others have more long-term implications. Although these crises may pose less of an acute threat, they are equally important issues on the global agenda. Many of these issues appear on the United Nations 2030 agenda for sustainable development as well as the World Economic Forum's Global Risks 2015 report and include issues related to sustainable use of resources, poverty, and climate change.

## Sustainable Development

Sustainable development is development that meets current needs without sacrificing the capacity to meet the needs of future generations. From a global agenda perspective, this involves several issues. Many of these issues have been captured by the United Nations which, on September 25, 2015, adopted the 2030 Agenda for Sustainable Development. Outlined within the 2030 Agenda for Sustainable Development are 17 goals and 169 targets to be achieved by 2030 through collaborative partnerships with nations around the world. Areas of critical importance include people, planet, prosperity, peace, and partnership.

Built on the Millennium Development Goals, the 17 sustainable development goals include:

1. Ending poverty in all its forms everywhere.
2. Ending hunger, achieving food security, improving nutrition, and promoting sustainable agriculture.
3. Ensuring healthy lives and promoting well-being for all at all ages.
4. Ensuring inclusive and equitable quality education and promoting lifelong learning opportunities for all.
5. Achieving gender equality and empowering all women and girls.
6. Ensuring available and sustainable management of water and sanitation for all.
7. Ensuring access to affordable, reliable, sustainable, and modern energy for all.
8. Promoting sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work for all.
9. Building resilient infrastructure and promoting inclusive and sustainable industrialization to foster innovation.
10. Reducing inequality within and among countries.
11. Making cities and human settlements inclusive, safe, resilient, and sustainable.
12. Ensuring sustainable consumption and production patterns.
13. Taking urgent action to combat climate change and its impacts.
14. Conserving and sustainably using the oceans, seas, and marine resources for sustainable development.
15. Protecting, restoring, and promoting sustainable use of terrestrial ecosystems, sustainably managing forests, combating desertification, and halting and reversing land degradation and halting biodiversity loss.
16. Promoting peaceful and inclusive societies for sustainable development, providing access to justice for all, and building effective, accountable, and inclusive institutions at all levels.
17. Strengthening the means of implementation and revitalizing the Global Partnership for Sustainable Development.

By raising these issues to the global agenda, the United Nations seeks to build cooperation between all governments and nongovernmental organizations as a means to mitigate the threat they pose to the people and the planet (United Nations General Assembly 2015).

## Global Climate Change

The potential threat posed by climate change and the impact rising sea levels and changing weather patterns may have on mankind have placed managing these issues among the most important on the global crisis agenda. A changing climate will have global financial consequences and dramatically impact efforts toward sustainable development. The very nature of the climate change crisis presumes its effects will be widespread, not limited to specific geographical regions or particular economic classes. No nation is immune, and no individual is capable of avoiding the effects of climate change. Efforts by a single nation, even one as powerful and influential as the USA, will have little impact on the global climate. As a global crisis, it requires a global response. In 1988, the World Meteorological Organization (WMO) and the United Nations Environment Programme (UNEP) created the International Panel on Climate Change (IPCC) in an effort to investigate and report scientific evidence on climate change and the potential global implications as well as a potential international response to this crisis. Since then, numerous international conventions have been held to address climate change and develop policies to manage the crisis.

Among the first efforts was the United Nations Framework Convention on Climate Change (UNFCCC) signed by 166 countries at the Earth Summit in Rio de Janeiro in 1992. Although the UNFCCC did not contain specific national or international targets to reduce emissions, it did establish foundational principles that have served future agreements. Emissions' targets for developed countries were first approved at the 1997 Conference of Parties meeting in Kyoto, Japan. This marked the beginning of efforts to manage the crisis of climate change globally through legally binding commitments to reduce emissions. It also established market-based international emissions trading. Unfortunately, several countries, including the USA and Canada, either chose not to ratify the treaty or withdrew largely over concerns that non-developed countries are exempt from the treaty including China and India.

Despite these concerns and an apparent inability to bridge the gap between developed and underdeveloped nations, the crisis of climate change remains high on the global agenda. The latest round of negotiations concluded in December of 2015. In a demonstration of the importance of the global agenda and the need to manage the crisis of climate change, the United Nations Conference on Climate Change in Paris reached a series of binding agreements on mitigating the potential threat posed by climate change. A key element of this agreement is the removal of the distinction between developed and developing countries, a critical source of frustration from the legislatures of developed countries. If ratified, all nations will be required to report efforts to reduce emissions and agree to an international review.

## Global Crisis Response and Management

A number of multinational organizations have as a mission to respond to acute crisis as well as long-term recovery and mitigation efforts. Since the adoption of the IDRL Guidelines by the IFRC in 2007, 23 nations have implemented new laws, rules, or procedures, and numerous international and regional organizations including the European Union, the African Union, the Organization of American States, and the Organization of Southeast Asian Nations made changes to policies, procedures, or structures to strengthen international crisis response cooperation based on the IDRL Guidelines. The IFRC has also signed memorandums of understanding (MOU) with several organizations to promote cooperation and support for the global agenda for managing crisis including the United Nations Office for the Coordination of Humanitarian Affairs and the World Customs Association.

The global financial crisis of 2008 continues to be an important issue on the global agenda. In response, the IMF publishes *The Managing Director's Global Policy Agenda*. The latest edition, published in April of 2016, notes that while the global economy continues to experience moderate growth, it has weakened in recent months by persistent slow growth. Threats to a full recovery include persistent high unemployment; high debt; low public investment, particularly in advanced economies; and the uncertainties related to geopolitical conflicts, non-state actor violence, and the inflow of refugees and uncertainty in the future of the European Union. To reverse this trend and secure a sustained recovery, the report suggests stable oil prices, greater action by central banks, and growth in demand for durable goods are needed (International Monetary Fund 2016).

The North Atlantic Treaty Organization (NATO) is also deeply involved in global crisis response and management. NATO is a political alliance created to safeguard the freedom and security of member states through both political and military means. In addition, NATO often partners with nonmember nation-states in times of crisis to ensure security and safety for those providing response and recovery services in the affected region. NATO has significant crisis management capacity and has the ability to plan and conduct large-scale multinational crisis management operations. It has the ability to mobilize large forces in short notice and to partner with political, civilian, and military groups to train and conduct operations to meet mission-specific goals. It is equipped to respond to military, political, or humanitarian emergencies that result from natural or man-made disasters.

NATO is also an important actor in the global crisis management agenda. Since the 1950s it has engaged in natural disaster response and recovery efforts. In recent years, the organization has broadened its approach to crisis response. It now actively engages nonmember states to respond, recover, and mitigate crisis. Through a comprehensive approach to the global agenda, NATO emphasizes training; support for local actors, both military and civilian; planning; and greater coordination between NATO forces and partners to coordinate crisis management efforts. NATO established the Euro-Atlantic Disaster Response Coordination Centre (EADRCC) in 1998, along with the Euro-Atlantic Disaster Response Unit to coordinate assistance and to deploy resources to affected member or partner states.

## Conclusions

Moving forward with a global agenda for crisis management will require continued diligence to sustain support for response, recovery, and mitigation efforts among the governments of the world as well as nongovernmental organizations. To accomplish these ends, cohesive structures that support global governance efforts related to crisis management are necessary. Cooperative response in the immediate hours and days following a major crisis will likely remain strong and positive. Differing priorities and geopolitical agendas may make sustained mitigation efforts challenging. In addition, a recent report published by HERE-Geneva found that roles and responsibilities to an international disaster remain unclear (International Federation of Red Cross and Red Crescent Societies 2015). Breakdowns in communication across governments during international response efforts are also a noted concern (Palttala et al. 2012).

The need for cooperation is well recognized; however, these persistent challenges make long-term cooperation for a sustained agenda difficult. For example, while the G20 response to the 2008 global financial crisis was generally thought to be successful, ongoing reforms to mitigate future global financial crises suffer from inconsistent implementation at the national level, conflicts among member nations, and inadequate international regulatory systems (Szczepański and Bassot 2015).

The triad of threats posed by climate change includes not only changing weather patterns but also dramatic implications for the global economy and efforts toward sustainable development. These issues are compounded by crises such as the 2007 global financial crisis and continued recovery efforts today. Issues such as these

along with the potential crisis of a pandemic and the threats posed by civil war and the resultant refugees and violence caused by non-state actors belong on the global agenda. Organizations such as the IMF, the World Economic Forum, and the United Nations must continue to build consensus around policies and practices related to managing global crisis. Working collectively with these organizations, the IFRC, NATO, and other support groups will continue to lead coordinated response and recovery efforts.

# Global and International Politics

Robert F. Gorman
Political Science, Texas State University, San Marcos, TX, USA

## Synonyms

International politics; International relations; Theories of international relations; World politics

## Definition

Global and international politics concern both the cooperative and conflictual relations that exist between and among governments of nations as they seek to advance the common security, well-being, and prosperity of their populations and territories in conditions of justice and peace.

## Introduction

International relations have existed from the dawn of recorded history. Trade relations and conflicts have existed between and among peoples,

empires, and feudal state systems for as long as human communities have been organized. Examples of this include the rise of Mesopotamian, Egyptian, Assyrian, Hittite, Persian, Chaldean, and Israelite kingdoms in the ancient Near East to the state systems in the subcontinent of India and Chinese Empires. Diplomatic contact, conflict, and commerce among these ancient political systems constituted a primitive form of interstate relations. With the rise of the Greek city-state system and the subsequent emergence of the Alexandrian and Roman Empires, another phase of international relations for which a substantial historical and political record exists established a foundation for the later development of the state system. Following the emergence of Christianity, which was the first religious tradition to distinguish separate roles for religious and political activity through the institutions of church and state, an additional dynamic process was introduced into the development of international relations throughout Europe and the Mediterranean basin. The collapse of the Western Roman Empire left the Catholic Church in place as a focal point for cultural unity, while secular states, at first of a decentralized and feudal nature, gradually evolved into larger and more centralized secular states. By the High Middle Ages, these European states grew in power and stature, competing among themselves and with the Church for control over territory and populations. The religious wars of the seventeenth century and the collapse of Christendom in Western Europe reached a turning point in 1648. In that year the Holy Roman Empire resolved disputes between Catholic and Protestant rulers in the Peace of Westphalia, which established the foundation of a new system of sovereign states, which in the following two centuries became truly globalized following the colonial expansion of Europe. In the twentieth century, rapid decolonization occurred during the Cold War, along the rise and fall of Communist states and the birth of the modern globalized system of political and economic order (Nye and Welch 2013).

The following analysis considers the historical development of international relations in light of several competing theoretical approaches that have vied as explanations for international behavior, including realist, liberal-idealist, and Marxist theories. Here it will be argued that a more comprehensive understanding of the global international order rooted in moral realism accounts for the basic assumptions of the other theories, while advancing a theory of institutional responsibility that promotes solidarity while respecting subsidiary rights of local and national actors.

## Realism and Moral Realism in International Relations

Consulting the earliest more systematic writings of philosophers in China, India, Persia, Ancient Greece, and the Hebrews, one finds sophisticated commentaries on politics and ethics. The uses and abuses of power are examined in these ancient writings, and within them one can begin to see reflections on the proper uses and limits of power as well. Many contemporary realists point to Sun Tsu's *Art of War* (ca. 300 BCE in China), Kautilya's *Arthashastra* (ca. 300 BCE in India), and Thucydides' *History of the Peloponnesian War* (ca. 400 BCE in Greece) as progenitors of the modern realist school of international relations, which emphasizes the calculated use of power to advance the interests of nations. However, these writings also contain observations on the limits and purposes of power. In them a moral awareness aimed at the common good and just treatment of the people, the distinctions between right and wrong behavior, and the general obligation to seek the happiness and flourishing of human communities are also discernible. Similar awareness is found in much older traditions of Confucian, Hindu, Hebrew, Zoroastrian, and Babylonian/Chaldean writings. Thus from the very first moments of conscious reflection of politics and power, matters of justice and moral obligation were also present in ways that offered rulers guidance not only on the effective and wise use of power but also on its limits in light of principles of justice. It is more accurate to characterize the early writings on the behavior of nations as moral realism.

However, because war is a constant feature of human history, a realist approach that looks to

power as a motivating principle of state behavior has dominated theoretical inquiry into international relations (Morgenthau 1985). Nonetheless, an even more widespread reality of human history is that of peaceful cooperation, often marked by trade, diplomatic ties, peaceful migration and settlement, and intercultural contact. To be sure, war has often interrupted peaceable states of affairs throughout history, but its inherent destructiveness has always evoked awareness that war needed justification. While just war thinking existed in many ancient cultural settings, the tradition that has most systematically influenced the modern international system began in the Ancient Greek philosophical writings of Plato and Aristotle, their successors who are the Stoics, and ultimately the great Roman philosopher Cicero, who systematized both the idea of natural law and the just war concept in Book I of his *De Officiis*. These would later be developed under the influence of Judeo-Christian thought to survive as the basis for modern laws of war. Cicero taught that war could be justified only when it was undertaken by a lawful sovereign for a just cause and with a right intention. Just causes for him included self-defense, protection of allies and other innocent peoples, and the glory of the empire. Right intention generally, however, required a motive to establish peace and justice without aggrandizement. He acknowledged that a prudent lawful authority would explore diplomatic options before using force. He noted that even during the course of war, basic justice should be sought, clemency afforded to defeated enemies, and a constant attention be paid to diplomatic means of bringing war to a swift and just conclusion (Waltz 2001).

## The Rise of Liberal-Idealist Thought

Although the Peace of Westphalia was primarily a European neighborhood arrangement to produce a more stable and peaceful regional environment, it corresponded to the European Age of Discovery and colonial expansion. The European state system was slowly globalized as Western European states, including Spain, Portugal, England, Holland, and France, claimed sovereignty over territories in the Western Hemisphere, coastal portions of Africa, South Asia, Southeast Asia, and East Asia. To acquire sovereignty for themselves, colonized peoples would eventually seek recognition from existing sovereigns, often after wars of independence. This began with the United States and the Latin American republics. As European imperial states dominated newly discovered areas, they imposed mercantilist economic systems, whereby they commanded control over the exploitation of resources to fuel their emerging industrial economies. Excess production was typically shipped backed to colonies that remained captive markets to European powers. However, the industrialization of Europe also gave rise to new economic theories emphasizing the deregulation of governmental control over economic activity. David Ricardo and Adam Smith emphasized the importance of free markets to the increase of wealth not only within but also between countries. Ricardo demonstrated the importance of the law of comparative advantage in international trade as a means to wider production and reduced prices for goods. A new science of international political economy thus emerged in the eighteenth and nineteenth centuries. Influential among these thinkers was Immanuel Kant, whose work, *Perpetual Peace*, emphasized that the problem of war among nations was only likely to give way to peaceable relations among nations if they engaged in cooperative trade, embraced democratic constitutions, and collaborated with one another in international organizations.

Liberal-idealist thought proposed a new way of conceiving international relations whereby the national state was only one actor among many, important to be sure, but linked and limited by various nongovernmental entities and coordinated by intergovernmental bodies of their own creation. With economics emerging as a powerful mechanism of production and change, European and Western Hemispheric countries began competing for global resources and markets. Colonialism in Africa commenced with greater energy after the Berlin Conference that ended the Franco-Prussian War in Europe, while the British, French, and Dutch expanded their domination of

Asian countries. Britain, the chief global naval power, gradually established a Commonwealth system of trade which anticipated and prefigured the possibility of a global trade system. Following the collapse of Napoleon Bonaparte's effort to establish French hegemony in Europe and the world, the Concert of Europe anticipated a world political system of collaboration. Apart from occasional eruptions of conflict, this multilateral approach to keeping peace was enhanced by a relatively stable balance of power in Europe even as European states began establishing international organizations to better cope with their mutual interests in taking advantage of new technologies such as the telegraph, establishing commissions for regulation of river navigation and trade, promoting more efficient postal communication, protecting countries from the spread of disease, encouraging the legal settlement of disputes through arbitration, and limiting the effects of war with the establishment of humanitarian law. A general optimism rose in the nineteenth century that enlightened states, now increasingly adopting democratic and parliamentary constitutions, cooperating in trade, and collaborating in various international forums, were on the cusp of establishing the perpetual peace predicted by Kant.

## The Marxian Political Economy Alternative

The nineteenth century, although dominated by the liberal theory of political economy, also saw the rise of a Marxist alternative. Karl Marx, a German refugee writing from London, proposed a whole new theory of political economy. Marx insisted that history must be understood from the perspective of historical materialism in which economic forces of production vied for dominance (Marx and Engels 1967). For example, primitive communism gives way to feudal systems of land ownership in which land owning classes dominate peasant workers. The feudal system, in turn, collapses owing to emerging merchant classes whose mobile wealth makes it possible to establish urban industrial systems of production that are far more dynamic, but which also exploit a new proletarian working class. Resentments among the latter predict inevitable proletarian revolutions in capitalist countries and the rise of the secular socialist state, where private property and wealth give rise to a socialist system of redistribution of wealth in the name of equality. With reeducation by the state, in which the previous roles of family and religion are rigorously repressed, it becomes possible for the new communist man to emerge and for the socialist state to give way to a global communist utopia. Marx failed to anticipate the strength of nationalism among peoples and the capacity of capitalist business interests to ameliorate the grievances of the working class through negotiation with union movements, as well as the enduring religiosity of human beings, but he did predict correctly the rise of the modern secular and regulatory state. Moreover, his ideas were warmly embraced by intellectual elites drawn to their egalitarian flavor and by individual leaders, such as Vladimir Lenin and Mao Zedong, who respectively applied and adapted them to the conditions they found in Russia and China (Tucker 1978). Thus although the heartland of Europe would prove largely immune from the socialist revolution Marx predicted there, the still largely feudal states of Russia and China would prove fertile ground for communist experimentation in the twentieth century as the European colonial system collapsed under the weight of two devastating world wars. The subsequent competition between the West and the emerging communist powers, the Soviet Union and Communist China, produced a century of unprecedented bloodshed.

## Contending Theories in the Turbulent Twentieth Century

At the outset of the twentieth century, the European powers still controlled much of the world through their colonial systems. In the Western Hemisphere, the United States emerged as a dominant military power backed by prodigious and growing commercial prowess. Russia by

contrast demonstrated fatal weakness in its contest with Japan which easily bested the tsarist regime in the Russo-Japanese War of 1905. The Age of Enlightenment was finally reaping benefits in the realms of science and technology, and the hope for a better future rested on a Kantian vision of perpetual peace constructed by human reason and secular democratic states cooperating toward the common good of humanity and finally laying to rest the superstitions and grievances of ages past. This ideal vision of the prospects for humanity was terribly shaken by World War I, which was the deadliest conflict humankind had ever before witnessed.

There were warning signs of the terrible devastation to come. In the first decade of the 1900s, many governments in Europe and in Asia, Japan, embarked on massive production of armaments. As they devoted more resources to building up their military capacity, their volume of trade began declining – a process documented by Richardson (1960). Nationalist fervor was on the rise, as was an emerging demand among non-self-governing peoples to national independence. In the Balkans, war between the Austro-Hungarian and Ottoman Empires and contested provinces seeking liberation from imperial control served as ominous harbingers of future woe. European powers quietly entered into secret alliances as they maneuvered to protect perceived interests. The assassination of Archduke Ferdinand in Sarajevo by a Serbian nationalist was the spark that ignited world war in 1914. As armies marched off to war, they were hailed with enthusiastic displays of nationalist fervor, everyone expecting a quick victory, like the rare and brief wars of the late nineteenth century. Instead, much to the world's dismay, a 4-year long, global war of brutal and industrial destruction ensued, in which 16–17 million people died, including around 6–7 million noncombatants killed owing to combat-related causes or to disease. The global scale of the war included naval combat in all the world oceans and land warfare in Europe, Asia, and Africa. About 650,000 Asians and Africans served in European armies. Chemical weapons, machine guns, tanks, submarine warfare, and air warfare made their debut as a means of combat and destruction. What could explain this outburst of inhumane violence?

To the realist the primary cause was the aggressive propensity found in human nature and the breakdown of the balance of power system. To the moral realist, the cause could be found in both the natural desire for security; the human propensity to pride, malice, greed, and domination; and the diplomatic misperceptions of governments. To the Marxist, the cause could be attributed to greed of governments and arms merchants that overrode the class consciousness of workers duped by patriotic appeals and nationalist fervor. To idealists the cause could be attributed to the lack of international cooperation, international law, and diplomacy that allowed trade to decline and arms races to begin and to the colonial systems that denied rights of national self-determination. At least initially the view of the idealists as propounded by the US President Woodrow Wilson prevailed, as victorious allies took steps to prevent such a future conflagration by establishing the League of Nations, promoting treaties of disarmament, and dismantling the imperial and colonial systems of the Axis powers, in the name of national self-determination. The League Covenant sought to establish a perpetual system of collective security. It was open to all nations, although the United States never became a member, and other powerful countries such as the Soviet Union and Germany were admitted later and then both withdrew in the 1930s, along with many other signatories. The turbulent 1930s were also marked by global economic depression and trade protectionism. The League placed former colonies of Germany in Africa and the Pacific under the mandate authority of victorious allies such as Britain, France, and Japan, while the Ottoman Empire was reduced to the modern state of Turkey as Ottoman territories in the Middle East were placed under British and French administration. Iraq and Saudi Arabia gained their independence from British administration in the 1930s. Austria-Hungary was dismantled, and its territories in the Balkans were granted independence as the Kingdom of the Southern Slavs or Yugoslavia. The League sponsored the development of the Permanent Court of International Justice and many other collaborative

efforts to cope with social, economic, and humanitarian problems, notably establishing the first agency for protection of refugees, who numbered in the millions following the war.

Apart from the problem of spotty membership, other factors reduced League effectiveness. These included rivalries among the Great Powers, ongoing nationalist sentiments throughout the world, resentments in Germany that fueled the rise of the Nazi party, increased military spending in Germany and the Soviet Union, and the imperial expansion on the part of Japan and Italy. All this challenged the capacity of the League's machinery for keeping peace (Nye and Welch 2013). In 1939 the invasion of Poland by Germany and a few weeks later by the Soviet Union catapulted the world into an even more deadly world war, dashing the hopes of idealists at least for the moment. During World War II, about 60,000,000 were killed, including 20–25 million military deaths, about equal numbers of civilian deaths, and another 20 million war-related death owing to famine and diseases. After the war it is no surprise that the realist and moral realist theory of international relations once again gained currency. But so too did a rival theory of Marxism, aggressively advanced by the emergence of the Soviet Union and later China as communist states offering themselves as models to large numbers of countries who would soon win their independence in Africa and Asia as European powers divested themselves of their colonies.

## Contending Theories in the Cold War Era

A moral realist perspective is evident in the years immediately following World War II. The Allies, including prominently the United States and Britain, and the Soviet Union, after June 1941 when Hitler invaded his erstwhile ally, began negotiations to replace the League of Nations with a revised global organization in 1944. The United Nations (UN) would defer in its Security Council to the cooperative capacity of the global powers by granting its five permanent members a veto. However, the expected cooperation gradually broke down in the years following the war as the Soviet Union consolidated its control over occupied nations in East Europe, and the Cold War emerged between a Western bloc led by the United States and a Communist bloc led by the Soviet Union. Shattered by the devastation of World War II, idealist thought gave way to a more practical moral realism that recognized the importance of power properly oriented to maintain peace and security. Still, the Nuremberg and Tokyo trials punished major war criminals, and crimes against peace and against humanity were defined in the hope of deterring future outrages. Added to these developments in the law of war was a new emphasis in the UN Charter on human rights and self-determination of peoples. Thus, although realist principles seemed to motivate state behavior after the war with the emergence of competing alliances in a new bipolar world dominated by two superpowers, elements of moral realism were also visible. In 1948 two major international documents, the Universal Declaration of Human Rights and the Genocide Convention, restored the principle that the human person is the subject of all politics and that human dignity calls for the respect of universal human rights, religious liberty, and the integrity of the family. In subsequent years the proliferation of human rights instruments would testify to the international community's aspiration to more noble behavior. In keeping with both moral realist and liberal thought, the number of independent and UN-related and other intergovernmental organizations (IGOs) proliferated to about 300, as did the numbers and activity of new international nongovernmental organizations (INGOs).

Moral realist thought could be also detected in the ideas motivating the restoration of Europe, which under the influence of Christian Democratic Union principles embarked upon a strategy of functional economic integration to achieve peace and prosperity advancing the common good of European nations. Supported by the United States, this strategy contained implicit elements of liberal-idealist thought as well, emphasizing free trade, free flow of capital and labor, and

the establishment of supranational regional institutions among social democratic states (Keohane and Nye 1977). If the West largely advanced a model based on liberty, the Communist bloc ideology emphasizing equality at the expense of liberty served as the competing model of state-centric planning and the elimination of markets and private property.

As Europe focused more on its own reconstruction and development, it also recognized the independence of its colonial possessions. By 1980 around 90 new nations gained independence and membership in the UN. Many of these Third World countries preferred a policy of nonalignment in the Cold War, but they could not altogether avoid its influence. Many of these new countries were attracted to Marxist models exemplified by the Soviet Union but also by the increasingly independent and distinct Maoist model in China (Wallerstein 2004). Others continued to tilt toward the West and its liberal monetary and trade models advanced by the Bretton Woods monetary system that relied on a strong US dollar backed by gold and the creation of the World Bank and International Monetary Fund (IMF). In addition, the free trade policies of the General Agreement on Tariffs and Trade came under pressure by nonaligned movement's UN Conference for Trade and Development, eventually producing reforms in the free trade approach to permit preferential trade models. Rooted in neoliberal thought that emphasized global interdependence, multilateral diplomacy, and regional trade approaches, preferential trade was readily adopted by the European countries, the United States, Japan, and other Western nations (Keohane and Nye 1977). The rise of Arab and other oil-producing countries produced another layer of states with a keen interest in exploiting markets to their national advantage (Nye and Welch 2013).

Although liberal economic principles contested with Marxist models of economic development, the political and military aspects of the Cold War could be understood in realist terms. The North Atlantic Treaty Organization (NATO) was established in 1949 as a regional defense alliance to contain the potential Soviet threat to West Europe. In response, the Communist countries formed the Warsaw Pact in 1956. Western countries, in turn, established defense alliances in central and Southeast Asia, while the United States also formed the Rio Pact in the Western Hemisphere. The Korean War of 1950 intensified east-west tensions, and as countries in the Third World gained independence, many found themselves engaged in deadly civil wars, motivated in part by Cold War ideology and competition. These included conflicts in Africa and Asia. In Latin America, the Cuban Revolution was followed by ideologically based civil wars in Central America. The Middle East conflict served as another hotspot for east-west contention that produced four Arab-Israeli wars. Conservative estimates put the death toll of these conflicts, genocides, and government-induced famines at 60 million – this despite the UN's collective security and humanitarian activities. Military expenditures and arms races dominated the foreign relations of many countries, to which one must add the specter of nuclear weapons. The United States, the Soviet Union, China, the United Kingdom, and France were the first nations to attain nuclear weapons, but later both India and France did so as well, along with Israel.

Soviet military and political expansion in the 1970s and 1980s came seemingly at the expense of Western political dominance in much of the Third World. However, the Soviet invasion of Afghanistan, coupled with expensive endeavors to support pro-Soviet socialist regimes, overtaxed the weak Soviet economy. A Western military buildup in the 1980s coupled with Western economic resurgence and Soviet economic bankruptcy and the collapse of Communist Poland, attributable in part to the influence of Polish Pope John Paul II's religious and political influence in his homeland, precipitated the collapse of the Soviet Union and the Communist bloc in the early 1990s, and a new era international cooperation and economic globalization began. In his 1991 farewell address, Soviet President, Mikhail Gorbachev, admitted that a major cause of the political and economic collapse of communism was its underlying moral bankruptcy (Gorman, *The Cold War*, p. 18).

## Contending Theories in the Era of Globalization

After the intense rivalry of the Cold War, the 1990s ushered in a unipolar system dominated by American military and economic power, in which liberal-idealist principles seemed at least for the moment triumphant. The Soviet Union eventually collapsed as its constituent socialist republics sued for independence and as former allies in East Europe were sued for entry into the European Union (EU) and NATO. The EU expanded and its economic productivity accelerated. Russia sought western assistance and it joined the World Bank and IMF. A new World Trade Organization was established to resolve commercial disputes between countries, and a globalized but also decentralized system of trade and foreign direct investment and aid stimulated spectacular growth in much of the world, including China which prudently determined to liberalize its economic system even as it remained under Communist party control. The general benefits of globalization gradually removed a billion people from the ranks of the desperately poor and global wealth production surged (Nye and Welch 2013). China emerged as an economic power, surpassing even Japan in economic productivity only 20 years after its decision to liberalize. India and Brazil also emerged as major regional powers and active participants in the globalized marketplace. Western countries in need of labor opened their borders to substantial immigration of peoples from the southern less-developed countries, and remittances by these migrants back to their home countries emerged as one of the most significant mechanisms for transfer of wealth, surpassing in many cases even official foreign development assistance and foreign direct investment.

Although the world still suffered from lingering conflicts, the UN's collective security system began to function in a spirit of wider cooperation as dozens of peacemaking and peace-keeping deployments gradually resolved civil wars and conflicts of the Cold War era (Weiss et al. 2014). Throughout Asia, Africa, and Latin America, a new wave of democratization occurred as nations adopted republican and parliamentary constitutions, offering the hope, based on democratic peace theory, that the world might at last become a more peaceful place since democracies rarely go to war with one another. International humanitarian aid mechanisms were reformed and extended to deal with those parts of the world, especially in Africa where civil conflicts continued, most notably in Sudan and Congo, where millions of people were still exposed to bloody conflicts.

But globalization had negative consequences. About a billion people in unstable countries enjoyed little positive benefit. Trafficking in human persons increased dramatically. Transnational terrorism, emerging with Al Qaeda in the 1990s, made a spectacular debut on September 11, 2001, with the attacks in New York and Washington, DC. In retaliation, US and NATO intervention in Afghanistan and Iraq in subsequent years demonstrated that military security remained an important component of international relations. Economic recession in the United States and slackening of economic growth in China produced a long period of globalized economic deterioration in 2008, leading to nearly 8 years of tepid global economic growth. The Obama administration consciously reduced the US political and military profile, as Russia, China, and Iran began to bid – on more realistic terms – to expand their power and influence. The Arab Spring in the Middle East, coupled with devastating civil wars in Syria and Libya, proved beyond the resolution of the UN or other collaborative institutions. Even the EU proved feckless in dealing collectively with the unprecedented flows of refugees into member states, who abandoned common asylum rules in favor of national protection and regulation of borders.

The rise of the Islamic State in Iraq and Syria and its swift and brutal acquisition of territory produced a haphazard international response, with Russia and Iran emerging as the proactive and dominant players as the United States settled for reactive responses. Long-standing resentments in the Islamic world and the emergence of jihadist movements in Asia, Africa, and Europe threatened global security and stability. Coupled with

collapsing fertility rates and consequent demographic decline, many countries in Asia and Europe face a difficult prospect of sustaining national economic growth. Under all these contemporary pressures, the triumph of liberal-idealist principles of international relations has come under serious challenge. Realists observe that Vladimir Putin's Russia is bidding for renewed global prominence, even as Iran dominates Iraq, Syria, and Yemen with Russian help. China militarizes the South China Sea and uses its recently acquired wealth to influence countries throughout Asia, Africa, and Latin America. With Europe and the United States in an apparent period of decline, the nature of the contemporary world order and the principles on which states interact once again leave room for debate. Realists will claim that not much has changed, as power politics and conflicting national interests persist. Liberal-idealists will argue that diplomacy, cooperation, and dialogue must continue. Marxists who seemed in total defeat might claim that its principles have not really been tried, and moral realists will assert the enduring value of human dignity in the midst of an imperfect world that will resist all human efforts to establish perfect peace and justice. However, despite a world historically marked by enduring contention, the human spirit also inevitably aspires toward those higher goals.

## Conclusion

We should not fail to notice different understandings about the proper organization of international, national, local, and subsidiary actors in addressing policy issues at these various levels of activity. Realists believe much of this is still the work of government interests. Liberal-idealists insist on the importance of global agencies and other private actors such as multinational corporations, INGOs, and domestic civil society. Marxists believe that the secular state is the key actor. Moral realists propose a systematic understanding of both solidarity and subsidiarity, especially in light of the profound role of religion and culture on society, economics, and politics (Gorman, *Toward the Common Good*, pp. 13–16). Subsidiarity implies that political, economic, and social problems should be resolved at the lowest, most effective, and directly accountable level. Solidarity implies that all levels and types of government exist not for their own power but to protect safety and dignity of human persons and their common good in local, national, regional, and international communities. Solidarity is most strongly felt at the level of the family, tribe, churches, and local community, where the vast majority of human security, economic activity, education, and preservation of human rights occur. But when local or national communities collapse under the weight of conflict or disaster, more comprehensive political institutions have a duty in solidarity to facilitate the restoration of their local or national vitality, while respecting their subsidiary rights and proper autonomy.

Too often in theorizing about the role of national government and global institutions, political scientists and students of public administration first look to more comprehensive institutions to solve problems, thus potentially violating subsidiarity. Moral realists recognize that certain policies can only be effectively addressed at the international level, but even so, such interventions stand little chance of success if the vitality and essential cooperation of local actors is ignored. Most human problems are best solved in the local, directly accountable setting. Even the recent economic globalization which has produced unprecedented wealth throughout the world was not primarily generated by the UN agency programs, but rather by the initiative of uncounted numbers of private ventures, family decisions to seek migration, and more open and efficient international trade. But globalization has also led to recent instabilities and the emergence of criminal and terrorist activities. This requires not just global institutional attention but also national and local attention to threats to safety and security. In this regard, moral realism protects against overly optimistic expectations of success in a world where perfect justice is elusive and where evil marches alongside goodness competing for dominance of the human heart.

## Synonyms

Transnational civil society

## Introduction

The impact of individuals in world politics has been a subject of interest to those working in the fields of International Relations (IR), public policy, and political theory. The term transnational or global civil society is used to articulate a global political space where individuals attempt to form transnational organizations and debate political issues outside the operation of states and the market. The terms global civil society and transnational civil society are often used interchangeably, although the term transnational suggests a more modest conception of this political activity which acknowledges that these political debates are not always universal or comprehensive. As such, the term focuses upon questions of public debate, political activism, and the operation of non-state actors such as nongovernmental organizations (NGOs), social movements, and religious groups which try to influence public opinion and thus publically influence the behavior of states, International Governmental Organizations (IGOs) established by states, and transnational businesses. This chapter presents an overview of the literature which considers global civil society by first defining the term global civil society, secondly by outlining the diverse dynamics of this activity, thirdly by considering how global civil society can influence global politics, and lastly by considering the consequences and potential of global civil society.

## Defining Global Civil Society

The idea of civil society is usually defined as the space which exists outside of the state and market where individuals publically debate political issues (Walzer 1995). This is sometimes referred to as the "third sector" of society (alongside the government and business sectors) which involves various non-state voluntary associations or a "public sphere" of peaceful deliberation about matters of public concern which involves various civil society activities. Civil society organizations (CSOs) encompass a range of organizations and forms of assembly which include NGOs, social movements, community groups, unions, faith-based organizations, journalists, academic and research networks, lobby and consultancy groups, think tanks, and professional associations. The reference to lobby groups indicates that civil society does not just refer to progressive or radical

political groups but can encompass actors which seek to protect the interests of industries and corporations. Indeed, while civil society refers to largely peaceful forms of political activity, civil society groups attempt to influence existing forms of governance with a range of different objectives and tactics. Consequently, they have varying levels of success in realizing their objectives in influencing the actions of governments and public opinion.

Civil society has a tendency to take on transnational dimensions. While some NGOs only work in their own country, there is no neat way of keeping civil society only within states because such actors often have a presence on the internet and in social media and thereby network with other NGOs in other countries and directly address people living in other societies around the world. Consequently, the term global civil society refers to the development of a global public sphere and transnational civic activity which cuts across national borders with International NGOs being an important part of this activity (Anheier et al. 2001; Price 2003; Dryzek 2012). This activity attempts to influence states, IGOs, and official forms of global governance and sometimes actually create forms of transnational governance or alternatively protests and resists global governance, states, and transnational corporations. In some idealized visions, this is seen to relate primarily as an global political ideal of cosmopolitan global civil society which involves the promotion of humanitarian and human rights values which transcend the idea of the state (as advanced by scholars such as Richard Falk and Mary Kaldor), while most others consider a more modest vision of global civil society which focuses upon the existence of transnational actors involved in the idea of a global public sphere which is comprised of debates between various actors animated by a wide range of agendas and values (Anheier et al. 2001, pp. 15–16). Despite a wide variety of values being present, there is no doubt that moral causes were prominent in the early operation of global civil society. The activity of global civil society can be seen in the humanitarian efforts of the nineteenth-century abolitionist movement to end slavery and the International Committee of the Red Cross which was a private humanitarian organization established by Henry Dunant and Gustave Moynier in 1863. NGOs continued to play a role in the twentieth century in supporting the development of the United Nations (UN) and the development of international law, especially with regard to human rights principles after the Second World War.

While global civil society has a long history, there has been significant growth in the presence and impact of global civil society in recent decades which has involved increases in number, size, and profile of CSOs. The growth in the number of international NGOs can be seen in the Union of International Associations (UIA) database with 22,200 international NGOs in 1990 and nearly 56,000 such organizations in 2010 (Anheier et al. 2012, p. 20). Related to this rise in the number of NGOs is rising scale and size of NGOs evident in large international NGOs like Oxfam, Amnesty International, Greenpeace, and World Vision. The development of large NGOs with operations around the world presents mounting challenges to ensure that such large NGOs are professionally run to maximize their effectiveness, accountability, and reputation (Ronalds 2010). Unions and business lobby groups have also taken on global forms of organization and coordination. Furthermore, formal NGOs are not the only form of civil society activism with the impact of more diffuse social movements, and networked community groups being important in constituting civil society activity. Important in this regard is the growing influence of the internet and online campaigns that address a wide range of global issues which include coalitions and networks of individuals and NGOs.

There are four primary drivers for the rising presence of global civil society. First, civil society is increasingly transnational due to the spread of liberalism and democracy in societies around the world in recent decades which have permitted citizens to create various civil society groups. Second, advances in communications and transport technology have reduced the costs and difficulties of organizing transnational political activity, with technologies like the fax machine and the internet providing crucial tools in enabling

civil society to operate globally. Third, it is the case that the growing numbers of IGOs can be a location which can generate the political agendas and spaces which cultivate a specific focus for civil society activity to engage with. Sidney Tarrow (2001, p. 15) indicates that IGOs like the UN can act as a "coral reef" for civil society activity, which creates a focal point around which an ecosystem of global civil society can form and operate (Tarrow 2001). Fourth, contemporary globalization has changed the moral landscape of political action with greater awareness of injustices occurring in various parts of the world and greater recognition of global problems which require globally coordinated action. In this sense transnational activism and civil society is very much enabled by the practical interdependence and the moral independence associated with contemporary globalization.

## The Dynamics of Global Civil Society

Different CSOs have different purposes and goals because they may act to reinforce, reform, or resist the status quo. Not all CSOs or NGOs are "progressive," with lobby groups like the National Rifle Association with respect to small arms, business lobby groups, and pro-capitalist think tanks being examples. Indeed, Leslie Sklair has pointed out, there are social movements "for" and "against" global capitalism (Sklair 1997). Furthermore, many forms of civil society activity are practical in nature, which attempt to reform specific policies or problems, and thus are not forms of activism that are attempting to initiate revolutionary change which aims to transform the underlying political structures of world politics. CSOs also have different strategies and tactics to realize their objectives in the sense they may seek to advocate and influence policy change, may be in the business of directly providing humanitarian aid and development assistance to groups on need, or may actually be involved in direct forms of protest. Indeed, for some groups and causes, direct forms of civil society activism are the only hope for initiating social change that can realize justice. There are significant differences even within social movements which act to promote significant social change. For instance, the Anti-Capitalist Movement which operated in the 1990s was shaped by different logics of attempting to create autonomous political spaces separate from global capitalism and attempting to promote technical arguments for political and economic change in the global capitalist system (Pleyers 2010).

There are various ways the dynamics of global civil society can be conceptualized. Importantly most conceptions point to the ways that NGOs and activists interact with other types of actors to influence world politics. One prominent way is developed by Kathryn Sikkink and Margaret Keck's focus on the way activists and NGOs work with other agents, including elements of some governments to form "transnational advocacy networks" which comprise of the "relevant actors working internationally on an issue, who are bound together by shared values, a common discourse, and a dense exchange of information and services" (Keck and Sikkink 1998, p. 2). Another conception is the idea of "transnational policy networks" which are specific forms of political practice which consider the ways policy making includes individuals and agencies beyond governments. Dianne Stone contends that transnational policy networks include "internationalized public sector officials," diplomats, public officials, and regulators engaged in international issues and networks; "international civil servants," officials working for IGOs; and "transnational policy professionals": "consultants, foundation officers, business leaders, scientific experts, think tank pundits, and NGO executives" (Stone 2008, pp. 30–1). Lastly, the term "epistemic communities" is sometimes used to emphasize the ways that a variety of actors influence the creation of ideas when transnational networks of "knowledge-based experts" are formed to help policy makers comprehend the problems they face, identify various technical policy solutions, and assess the policy outcomes (Haas 1992). These conceptualizations claim that transnational agents such as activists and CSOs combine with IGOs and parts of some governments to share information, strategize, and apply coordinated pressure to governments in relation to a particular issue.

However, global civil society may be evident in other forms of political activity more independent from states and IGOs because not all CSOs play a direct role in policy engagement and may focus their efforts to mobilize public interest in their causes. Some CSOs create their own political spaces to debate political issues and thereby create social movements. Social movements are generally understood as social collectivities which involve "a network of informal interactions between a plurality of individuals, groups and/or organizations, engaged in a political or cultural conflict, on the basis of a shared collective identity" (Diani 1992, p. 13). Such movements comprise various forms of policy and political engagements which are developed in specific contexts which can take on various transnational dimensions. For instance, the environmental movement has involved various forms of protest since the 1960s but also led to policy engagement with IGOs and led to creation of Green political parties around the world. Some social movements have shorter lifespans or more narrow geographical focuses. Furthermore, some campaigns exist primarily on the web and are somewhat derisively referred to as "slacktivism," as was in the case of KONY 2012 campaign which used Facebook to create an online campaign to raise the profile of the issue of child soldiers in Africa. Lastly, some CSOs create their own transnational systems of governance and rules which they try to get governments, businesses, or the public to use to regulate and avoid problems in a particular issue area (Hale and Held 2011). The idea of Fair Trade is an example of this.

Despite playing various roles in policy making and pushing social change, it is important to explain that there are some immediate limitations and dangers associated with the idea and operation of global civil society. First, it is the case that not every deserving cause gets active and effective civil society attention because some causes do not attract support and some groups do not create effective connections with larger civil society networks. Such exclusions are sometimes related to the problem referred to as the "digital divide" which acknowledges that some subaltern groups do not have the resources or access to technology to engage their message with transnational civil society. Second, a related limitation of global civil society is that it reinforces western perspectives and ideas in world politics given that the larger NGOs are largely based in western societies. Third, CSOs – even NGOs – may have strategic imperatives that shape what they do which may differ from the people they purport to serve. Clifford Bob makes the claim that NGOs are "merchants of morality" which act as mediators between wealthy people who want to help and poor people needing help, but that the interests of various NGOs determine which causes receive attention and assistance and which causes do not (Bob 2002).

A fourth limitation of global civil society is that there are some rare cases of policy issues where there is scant civil society activity because the policy environment is hostile to CSOs. The area of global finance has been traditionally dominated by governments and business interests with critical CSOs being limited by a lack of capacity and expertise in conjunction with a lack of transparency of the systems of governance that govern global finance (Scholte 2013). Lastly, it may be the case that the capabilities of CSOs can be co-opted by governments or other authorities. Clearly for CSOs to realize their objectives, they have to negotiate with governments to deliver aid or politically engage their societies. In order to gain ongoing access to such societies, CSO may moderate or censor their political agenda. Indeed, in the worst case, civil society can be faked by the government. This is sometimes called "astroturfing" where governments or businesses create or use CSOs to generate fake or artificial support, rather than real "grass roots" support.

## The Influence of Global Civil Society

The overall impact of CSOs and global civil society is often hard to discern because while the presence of civil society is ubiquitous, the effects vary in different policy areas and contexts. Imperfect as global civil society is, there are different types of power and influence, which entails different strategies and tactics to influence authority

and various publics around the world. Consequently, understanding the power of CSOs and global civil society requires a nuanced view of power evident in Michael Barnett and Raymond Duvall's typology of "compulsory power," "institutional power," "structural power," and "productive power" (Barnett and Duvall 2005). Transnational activists sometimes possess compulsory power, which includes direct attempts to influence the actions of another actor through direct threats or coercion. While activists do not generally have the capacity to coerce governments and do not use intense physical violence, they do often conduct physical protests, occupations of particular spaces, or direct action. Most forms of physical protests are deemed to be legitimate in liberal democratic societies, such as those conducted by the Anti-Capitalist Movement in 1990s or the Occupy Movement after the 2008 global financial crisis. However, sometimes direct action is highly contentious, as evident in the attempts by the Sea Shepherd Conservation Society to intercede and disrupt whaling ships at sea.

Transnational activists sometimes develop forms of "institutional power" where they are able to exercise indirect forms of control via formal or informal institutions, which set the policy agenda. This can involve a CSO lobbying states to create forms of international law that address issues of concern to that organization. For instance, the Coalition for the International Criminal Court involved NGOs who collectively advocated for the creation and effective operation of the International Criminal Court (ICC). There is also the possibility that elements of civil society will be included in the operation of official forms of governance. This inclusion is referred to as multistakeholderism or multisectorialism, such as the way that civil society groups are represented in the Global Fund to Fight AIDS, Tuberculosis, and Malaria (Brown 2009). This can also involve CSOs creating their own rules to address a specific problem. Creating transnational governance is a tactic of activists. It is a form of institutional power whereby activists want to create authority in the form of rules and regulations for a given policy area. For instance, Fair Trade is a form of transnational governance which is a form of voluntary regulation and certification whereby consumers pay an extra premium for goods produced in a manner where the producers get above market remuneration. In cases where binding international law is unlikely to be realized, such informal forms of transnational governance is the best form of regulation that activists can hope to realize.

The "structural power" of transnational activists is evident in direct efforts to influence the capacities of other actors by creating particular forms of incentives to act in ways which correspond with the agenda of certain CSOs. This is evident in efforts of NGOs who provide public services such as the delivery of emergency humanitarian or development assistance. This is demonstrated in efforts of International Red Cross and Red Crescent Movement, Oxfam, and Save the Children. This also requires raising public awareness and fund raising to finance this activity. Another form of structural power is evident in efforts to conduct boycotts and embargoes of corporations or countries in order to induce changes in policies and practices. Such a tactic was used by the Abolitionist Movement against slavery but more recently has been used successfully by environmental groups calling for a boycott of Nestlé because of deforestation caused by its products, which ultimately led it to change its supply chain policies. Furthermore, sometimes CSOs seek to disseminate information to illuminate the activity and influence the behavior of states and corporations. The WikiLeaks campaign to leak sensitive information is one prominent and controversial example of this type of influence (Slaughter 2014).

Lastly, transnational activists can be seen to have "productive power" where they are able to indirectly influence and produce particular social capacities of governments and other actors. CSOs have considerable impact on ideas in society and government as they "shape policies, norms, and structures in society at large" (Scholte 2002, p. 284). This is where CSOs can influence political discourse to shape how IGOs, governments, or the public perceive an issue. A successful example

of this was the shift initiated by the anti-whaling movement which successfully shifted public opinion in many societies from seeing whales as a commodity to a valued and endangered animal (Epstein 2005). Furthermore, there has been an increase in attention paid the problems and contributions of women involved in conflict thanks to the sustained lobbying of the UN by Women rights NGOs who demonstrated the ways that rape in the civil conflicts of the 1990s was seen to be "tactical rape," meaning that it was a deliberate tactic of war in these conflicts and was a serious issue of International Humanitarian Law and a threat to human and international security (Fitzpatrick 2016). Less successfully, the Occupy Movement also attempted to change the public discourse around inequality by using the terms the "1%" and "99%" to outline problems of economic and political inequality. These examples demonstrate that this type of power is shaped by both technical expertise as well as moral and emotional persuasion, which utilizes symbols, images, and narratives to induce changes in the beliefs and opinions of policy makers and the broader public. In this sense, CSOs can be seen to be "moral entrepreneurs" which disseminate ideas and norms in world politics (Finnemore and Sikkink 1998).

These types of power and influence overlap in practice. It is sometimes the case that direct protests may support and strengthen other types of power. However, there are limits to the influence of CSOs. It is often difficult to convey their message in a media-saturated world, especially when the message is a complicated response to a deep-seated political problem. It is also the case that the diversity of moral and political positions in the world is bewildering and difficult to represent in global governance (Dryzek 2006). The power of CSOs also depends upon whether particular states, IGOs, and corporations are susceptible to moral and political pressure. Also there have been some sharp responses to the foreign influence of global civil society, and consequently, some governments do not allow some types of CSO actors to operate in their territory with respect to some or all policy sectors. This has been evident in the response of the Russian government to LGBT human rights groups by restricting the operation and transnational relationships of these groups and also by advancing the importance of "traditional values" as a counter narrative to human rights (Wilkinson 2014). These reactions to the operation of CSOs and global civil society demonstrate that this civil society activity represents an important counterpoint to a world where political decisions are made primarily by governments and official forms of authority and governance.

## Political Consequences of Global Civil Society

The idea that CSOs are playing an increasingly active role in world politics gives rise to the idea that global civil society means that there are indications that we are witnessing a shift away from the conventional "Westphalian" image of interstate cooperation where states are the only significant political actors, toward a more complicated model of cooperation where a wide variety of CSOs have some impact on the rules and operation of global politics. Indeed, some scholars suggest that this is the emergence of "complex multilateralism" where states and IGOs are routinely overlayed by non-state actors (O'Brien et al. 2000). However, neither the ubiquity of CSOs nor their routine engagement with states detracts from some of the immediate and potential impacts and consequences of global civil society.

The existence of global civil society has a considerable impact on the official processes of global decision-making. It is clear that there are now a wide range of perspectives routinely brought to bear on any global political issue and that states no longer have a monopoly on representing their publics. Consequently CSOs have a played a key role in publicizing the ideas such as human rights and environmentalism which have challenged the conventional agendas of states (Anheier et al. 2012, p. 2). While this makes world politics more chaotic than a world just comprised of states, it also opens up new

forms of contestation and transparency. The activity of CSOs in global civil society offers a key way to promote various forms of transparency and accountability which would not otherwise exist. CSOs can act as watchdogs against arbitrary power and give a practical form of representation of vulnerable people and neglected causes which can play some role in promoting justice. In particular, CSOs play a crucial role in holding various IGOs and forms of global governance more accountable than they would be otherwise (Scholte 2011). In this sense, CSOs play a crucial role in reducing the "democratic deficit" that IGOs normally have with respect to being remote from the societies around the world that these IGOs effect. This produces an additional hope that CSOs can provide alternative ideas and information to these forms of governance and thereby improve the decision-making of IGOs.

Of course questions are leveled at the accountability of CSOs themselves. After all CSOs are not formally elected by the public nor procedurally accountable to the public (Dryzek and Niemeyer 2008), and they often act to contest the decisions of elected officials of states and IGOs which are legally enacted by states. John Dryzek wards off criticisms about whether CSOs in global civil society are substantively unrepresentative by contending that:

> A better response to the charge is to ask: Unrepresentative compared to what? Compared to some ideal model of egalitarian democracy, global civil society may do badly. Compared to other realities in a global order dominated by large corporations, hegemonic states, neoliberal market thinking, secretive and unresponsive international organizations, low visibility financial networks, and military might, global civil society does rather well. (Dryzek 2012, p. 107)

The point here is that CSOs are imperfect but the context of world politics has typically permitted arbitrary forms of power which mean that efforts to promote justice have been limited. Consequently, we should not deny the beneficial consequences of increasing the diversity of voices in global governance and giving marginal voices some agency. While CSOs who represent marginal voices need to engage with more well-funded CSOs, including corporate lobby groups and think tanks, at least this means that deliberation between different groups is made more visible within this transnational context. The potential consequences of global civil society are also not just restricted to global politics. CSOs are a routine part of domestic politics and provide an important external prompt for national publics to be reminded of the external implications of national decisions.

In addition, there are potential consequences of contemporary global civil society being a more fundamental challenge to the Westphalian notion that world politics is shaped mainly by states. Recently observers of global civil society have argued that the increasing efforts of CSOs to systematically contest arbitrary power in global politics are more than just political influence on discrete policy issues and that these forms of transnational activism and contestation are best understood as early stages of an incipient process of transnational democratization (Dryzek 2011; Keane 2011; Goodin 2010). These incipient forms of public engagement are democratic in the broader sense of attempting to promote transparency and therefore publicly moderate and hold authority to account. However, these forms of global civil society are not currently a democratic world government, and most CSOs do not intend to create a form of transnational democracy (The World Federalist Movement is a notable exception. See Luis Cabrera 2010). Yet this activity can be seen to be an early and embryonic sign of a fundamental change in world politics. As Robert Goodin cautions:

> When it comes to the global polity, we are still very much in the early days – both of developing a global polity, and still more of democratizing it. What we should be looking for in that context are "first steps," not final steps. (Goodin 2010, p. 179)

This vision is where the individuals involved in CSOs are harbingers of a changing context of world politics. While there are a range of different theoretical models of what democracy could look like in world politics (Bray and Slaughter 2015), it is clear that global civil society is a crucial element to enacting efforts to democratize world politics.

## Conclusion

The term global civil society depicts a world where there are a wide variety of transnational actors which debate political issues and attempt to influence prevailing systems of governance. Indeed, virtually every issue area has civil society actors attempting to influence the behavior of states, IGOs, and businesses. While there are situations where civil society dynamics are ignored, there are occasions where civil society groups are able to influence powerful actors and potentially transform the nature of world politics.

# Global Competency in Public Administration

Michael Guo-Brennan
Department of Political Science, Troy University, Troy, AL, USA

## Synonyms

Cultural competence in public administration; Global citizenship in public administration; Globally engaged public administration

## Definitions

Global competence in public administration involves having the knowledge, beyond culture, and understanding and appreciation of difference to take action that promotes social justice for all in the community and to encourage civic engagement and participatory citizenship.

## Introduction

The purpose of this entry is to define the changing role of public administrators in the globalized world of today. Globalization and global mobility have greatly increased the cultural, ethnic, linguistic, and religious diversity in cities and communities around the globe and have impacted the social, cultural, economic, and security aspects of local public policy and services. These changes demand local governments that are responsive, flexible, and globally aware in order to develop and build welcoming and inclusive communities for all residents, particularly newcomers. Public administrators and others in authority must be globally competent to successfully function in this new arena. They must possess the knowledge, skills, understanding, and the ability to take action to encourage inclusive civic and community engagement.

Global migration has greatly increased the cultural, ethnic, linguistic, and religious diversity in cities and communities throughout the world and has impacted the social, cultural, economic, and security aspects of local public policy and services. Since this transnational connectivity is increasing, and immigrant integration is a process that ultimately fails or succeeds at the community level, local governments in many countries are being forced to take a more proactive stance in developing and implementing their own policies of settlement and integration to promote welcoming and inclusive communities for all, particularly newcomers. Public administrators are being called upon to manage increasingly diverse communities, to provide leadership and direction to local elected officials and others in the community who may not fully appreciate the benefits this brings to the community, and to lead a staff that is becoming more diverse, with different needs and different expectations of their work. To successfully integrate appropriate policies, programs, and practices and build a welcoming community that considers these challenges and meets the needs of all residents, public administrators must be globally competent (Cities of Migration 2018a, b; Sabchev 2017; Tossutti 2012).

In addition to many obvious characteristics such as language, religion, and cuisine, immigrants' settlement and integration into new communities have distinctive social, economic, and educational characteristics (Edmonston 2016). As the level of government closest to the people, local governments most directly impact and are impacted by the lives, successes, and challenges of those who live in the community, including immigrants. Limited financial resources, long histories of homogenous resident population, and relatively isolated locations are obstacles many communities face when trying to meet the needs of increasingly diverse population. Diversity within communities creates additional challenges as a shared understanding of community culture and history often becomes diffuse as more and more of people "from away" populate the community. This can create tension between various groups, and the established population may not appreciate the benefits newcomers bring to the community. Local governments and public administrators are at the front lines in these communities and must develop inclusive public policy

and services that can lead to prosperity and inclusion for all residents.

To successfully manage these challenges, public administrators need the requisite knowledge to function in a diverse, multicultural environment. This goes beyond being culturally competent, which is concerned with an awareness and openness to difference. Globally competent public administrators are culturally aware and are open to difference but also understand the impact of globalization and other global scale events and can place these in the context of the local community. This knowledge allows administrators to see the benefits of diversity and cope with the realities and challenges diversity brings with it to promote inclusive policies and programs. This task is inherently complex because inclusion is a collaborative outcome reflected in all aspects of a municipality's work, including public services such as police and other emergency services, planning, parks and recreation, health services, education, public works, and public transportation, as well as nonprofit organizations and for profit private organizations (Cities of Migration 2012).

Belongingness – the psychological sense that one fits in and is accepted in an environment – is a fundamental need of newcomers and is associated with many positive outcomes, such as greater social cohesion, better employment opportunities, enhanced quality and equality, and greater health (Neufeld et al. 2016; Walton et al. 2012). Public administrators and community leaders have a critical role to play in encouraging a welcoming environment and countering the negative stereotypes often portrayed in the media as this can lead to an erosion of newcomers' sense of belonging and reinforce their marginalization and exclusion by treating newcomers as the scapegoat of larger societal problems rooted in economic globalization, global geopolitical crisis, and racism and discrimination (Bloemraad 2011; Sabchev 2017).

## Understanding What It Means to Be a Welcoming and Inclusive Community

Public administrators play a critical role in creating the conditions that allow for different groups to interact and build positive connections by creating an environment that is sensitive, aware, and open to difference, encourages cross-cultural interaction and communication, and leads to strong intergroup connections and attachments. Success in this role requires broad knowledge that goes beyond cultural understanding. It requires knowledge and understanding of newcomers, including their needs, desires, and wants.

Recognizing that the concept of a welcoming and inclusive community for newcomers is still emerging and gaps remain in reaching a consensus on a systemic approach, for this entry, a welcoming and inclusive community has the capacity to support the needs of newcomers; promotes intergroup cooperation, goal development, and inclusion of newcomers; has an awareness, sensitivity, and openness to different perspectives and points of view; provides support to external groups engaged with newcomers; and places a high value on cultural and global competence among elected officials, management, and staff.

## Public Administrators and Welcoming Communities

Leadership knowledge, engagement, and understanding are critical for building welcoming communities and helping newcomers to succeed and prosper in a new society or community. As national governments establish policy that rely on immigration as a source in increased population, local administrators must understand the impact this will have on the local community. They must understand that government and community services need to be more inclusive and promote equity and respect for difference. Policies and programs should be responsive to the diverse needs of the community. Globally competent administrators must be flexible and work with elected officials and other leaders to help them understand the importance of meeting the needs of all in the community. It is important that public administrators assist these leaders to increase their awareness and

understanding of newcomers' needs, experiences, and challenges to develop inclusive and culturally responsive policy and programs. Increasing the awareness of these elected officials to the growing diversity within the community is also an important step in generating stronger community engagement.

## Taking Action

Globally competent administrators who possess the knowledge and understanding of what it means to be a welcoming community are in a strong position to take positive and proactive action to promote inclusion and justice. They must develop culturally responsive policies, programs, and strategies for a population with diverse social, economic, cultural, and linguistic needs and expectations. This demand is particularly urgent in communities where the culture and population have been historically homogenous. Globally competent public administrators should consider the following strategies to build welcoming and inclusive communities:

1. Develop a strategic plan or action framework to build a coalition to enhance inclusion and equity in the community. This includes articulating a vision for a welcoming and inclusive community in all documentation and planning.
2. Identify building welcoming and inclusive community as a political imperative and desired management competency at all government levels.
3. Evaluate and report strengths and achievements at both the organizational and community levels.
4. Inspire and demand all governmental organizations to serve as a role model to other institutions by demonstrating a genuine commitment to minority communities.
5. Recruit culturally competent leaders and public administrators, and offer professional development to build staff's global awareness and cross-cultural understanding.
6. Implement policies, procedures, and strategies to improve cross-cultural learning and understanding.

## Developing a Shared Vision and Understanding Among Community Stakeholders

Policy initiatives related to building a welcoming community require collaboration and a shared vision by all governmental and community stakeholders (Tossutti 2012). Collaboration and a shared vision require agreement on key issues and problems. Public administrators should take the lead in building this vision. That can be challenging as leadership from different organizations may have different needs, priorities, and levels of awareness.

For governments, it means greater understanding of the needs of those arriving in a country, while nonprofit organizations need information to better inform the local community about the types of newcomers living in local communities as well as their unique needs, issues, and concerns. Misinformation and ethnic stereotyping may lead to a lack of accurate information on who they are and how they came to the community; what their hopes and challenges are; the contributions they make to the local economy, jobs, culture, and society; and accurate information about financial support and other services they receive from the government.

The articulation of the shared vision should be reflected in public policy, including municipal and council documentation and planning, and openly and publicly acknowledged as a commitment to support those who are working towards it. Procedures and strategies for promoting inclusion and equity and reducing racism and discrimination should be developed collaboratively and shared as a tool to inspire all community stakeholders and members to act.

Building a shared vision and understanding that is inclusive and equitable and involves long-lasting collaboration among diverse groups is critical to making newcomers feel welcome. For this to happen, public officials need to carefully frame issues in a way that builds inclusion for all stakeholders. Struggles around language, definitions, meanings, and competing agendas can break down collaboration and community engagement. Success can and should be achieved through a safe and inclusive process which includes communicating a vision of a just society for all, bridging difference, building

relationships, and facilitating a common understanding of language and approaches.

Bringing diverse groups together is a critical task of local government. Through shared experience comes shared understanding and a breakdown of walls and false assumptions about those who are different. Local community members may desire more opportunities for intercultural understanding and communication but are concerned with possibly offending newcomers due to a lack of cross-cultural communication skills. Public administrators have a responsibility to encourage opportunities that build those bridges of understanding. Clarifying these issues and providing better information should be a priority as it can help strengthen partnerships and develop a shared vision for a welcoming community for all.

## Strengthening Local Ownership and Community Partnerships

Engaging community stakeholders in building inclusive and welcoming communities is critical to achieve successful outcomes. Building welcoming and inclusive community needs to be an open and visible processes of community-wide visioning, planning, and discussion. Stakeholders in the private sector, such as restaurants, car dealers, pharmacies, grocery stores, banks, and real estate agencies, have a strong motivation and reach out to newcomers (who were both potential customers and employees) and could play a more active role in responding to newcomers' needs. However, stakeholders in the public sector often face greater challenges in creating a welcoming and inclusive environment for newcomers. Most organizations delivering public services such as policing, health services, legal services, and parental involvement in education struggle in interactions with newcomers due to linguistic and cultural differences.

## Reducing Language Barriers for Community Engagement

Language plays an important role in building welcoming and inclusive communities because it is not only an inalienable component of one's cultural identity but also the most important tool for economic/social/political engagement and empowerment (Wardhaugh and Fuller 2015). For newcomers, language is the first and probably most important factor excluding them from the society and community. To build inclusive communities for immigrants and refugees and increase cross-cultural understanding, public administrators should promote policies that address language barriers. To mitigate this issue, both the public and private sectors need to increase linguistic awareness and expertise, provide information and services in multiple languages, and celebrate linguistic diversity as a strength for living and working in a globally interconnected world.

## Rewarding Commitment and Celebrating Success

In addition to policy gaps and funding issues, systemic racism and discrimination are important factors for hindering political, social, cultural, linguistic, and economic equity in a new country. Successful efforts that reduce barriers, increase cross-cultural understanding, build relationships, and engage all members of the community should be recognized and rewarded. Public managers' global awareness and cultural competency is pivotal for developing culturally responsive public policy and services and should be fostered, developed, and rewarded (Longoria and Rangarajan 2015). Media, public education, and training for creating an inclusive environment and opportunities to build understanding, relationships, and trust among stakeholders are fundamental to sustain success and should be promoted and easily available to citizens. Through public pronouncements and financial and other supports, community stakeholders including the local government recognize and reward community efforts to help newcomers feel welcome.

## Conclusion

Global migration and geopolitical crisis are challenging the practices of local government and

public administration in democratic societies at an unprecedented level (Yilin et al. 2011). By sharing an enriched understanding of the existing issues related to inclusion, access, equity, racism, and discrimination, this entry aims to properly define the expanded role of public administrators in the context of the modern globalized world and share some innovative solutions to this multilayered and complex task that demands collaboration, resource allocation, innovation, and commitment. Building welcoming and inclusive communities for all involves creating a shared vision, building trusting relationships among stakeholders, learning from mistakes, and building capacity at both organizational and individual levels based on a deep understanding of the local, national, and global contexts. It also involves effective public policy and action plans that reflect successful experiences and practices.

# Global Cyberspace Security and Critical Information Infrastructure Protection

Tuba Eldem
Department of Political Science and International Relations, Fenerbahçe University, Istanbul, Turkey

## Synonyms

Critical information infrastructure protection; Critical infrastructure; Cyber norms; Cybersecurity; Cyberspace; Cyberspace security

## Definitions

**Cyberspace:** Global domain within the information environment consisting of the interdependent network of information systems infrastructures including the Internet, telecommunications networks, computer systems, and embedded processors and controllers (NIST SP 800-53 Rev. 4). In addition to the physical infrastructures, cyberspace also comprises the virtual world or domain including non-physical elements, such as ideas and virtual realities.

**Cybersecurity:** The protection of information and communication technologies from

unauthorized access or attempted access (Finnemore and Hollis 2016)

**Cyberspace security:** Actions taken within protected cyberspace to prevent unauthorized access to, exploitation of, or damage to computers, electronic communications systems, and other information technology, including platform information technology, as well as the information contained therein, to ensure its availability, integrity, authentication, confidentiality, and nonrepudiation (JP 3-12; DOD Dictionary 2020).

**Critical infrastructure:** Systems and assets, whether physical or virtual, that are essential for the functioning of the society or economy of a nation

**Critical information infrastructure:** Interconnected information and communication infrastructures which are essential for the maintenance of vital societal functions (health, safety, security, economic, or social well-being of people), the disruption or destruction of which could have serious consequence (GFCE-MERIDIAN 2016)

## Introduction

Cybersecurity is a fairly new international issue. Two decades ago, it received little attention as an international problem and largely associated with the technical protection of computer systems. By the beginning of the 2020s, cybersecurity risks, such as breakdown of critical information infrastructure (e.g., Internet, satellites) and cyberattacks or malware against individuals and businesses, are considered among the top ten global risks (World Economic Forum 2020). Cybersecurity has become a global challenge, whether considered in economic, humanitarian, or national security terms. In economic terms, RiskIQ (2020) expects that by 2021 cybercrime will cost the world US$11.4 million each minute, whereas Cybersecurity Ventures (2020) predicts that cybercrime damages will reach US$6 trillion in 2021, what would be equivalent to the GDP of the world's third largest economy and more profitable than the global trade of all major illegal drugs combined. Data fraud or theft, which is within the list of top 10 long-term risks identified by the World Economic Forum, has also been increasing in scope. A total of 36 billion records were exposed in the first 9 months of 2020 making it the "worst year on record" (Risk Based Security 2020). The COVID-19 pandemic in 2020, impacting nations and significantly disrupting the work of companies and international organizations, has also accelerated the world's transition to an information and communication technology (ICT)-enabled lifestyle where commerce, education, work, and governmental functions have mostly moved online. This sharp increase in the use of digital services putting critical infrastructure and essential services – especially in the healthcare sector – under considerable stress highlighted the humanitarian costs of cybersecurity. Allegedly state-sponsored cyber-operations targeting critical infrastructures in Estonia in 2007, Georgia in 2008, Iran in 2010, Ukraine in 2015, and India in 2019 have on the other hand illustrated the national security stakes of cybersecurity.

This article, therefore, argues that despite the technical-functional nature of cybersecurity, twin imperatives of market economy and national security have always driven the national and international cyberspace security policy and contributed to the emergence of an international understanding that associates cyberspace security first and foremost with the protection of critical information infrastructures (CII). This article elaborates this argument in three sections. The first section reviews the manifold conceptualizations of cyberspace and cyberspace security underlining the broadening of the concept of cybersecurity from security of computer systems to the ability of an actor to protect itself from a variety of risks to and through cyberspace. The second section shows how economic imperatives have driven the protection of CII as a cooperative objective for the functioning of the global market economy, and the final section focuses on how national and transnational security imperatives have driven the emergence of a norm on preventing cyberattacks on CII.

## Global Cyberspace Security

The concept of cyberspace is the foundational element with regard to cybersecurity since it is a type of security that unfolds in and through cyberspace. Yet, there is still ambiguity and inconsistency in describing what constitutes cyberspace. The term, cyberspace, was introduced by William Gibson in his novel, *Neuromancer* (1984), to explain a fundamental transformation in human-machine relations facilitated by a massive interlinking web of computer networks. The prefix cyber refers to computer and electronic-centered technologies, and the concept of cyberspace refers to a "human-made domain for action that exists as a consequence of an interconnected and interdependent global communications and computing infrastructure" (Deibert and Rohozinski 2010, pp. 15–16). Thus, the concept of cyberspace includes the totality of the interdependent network of information technology infrastructures comprising not only Internet and Internet-connected devices but also the telecommunications networks, computer systems, and embedded processors and controllers as well as the virtual world or domain including non-physical elements, such as ideas and virtual realities.

A number of different conceptualizations have been offered to define cyberspace in terms of layers, such as the physical network, logical network, and cyber-persona layers used in US *Joint Publication 3-12 Cyberspace Operations* (US 2018, p. 3) or the physical, logical, and social layers of cyberspace used in the *Tallinn Manual* (Schmitt and NATO Cooperative Cyber Defence Centre of Excellence 2017, p. 12). The foundational layer of cyberspace is the physical infrastructure, which refers to the machines – such as the computers, routers, cables, servers, cellphone towers, and satellites – that establish the mechanical and electrical, magnetic, and optical lines of communication (Deibert et al. 2012, p. 5). It serves as the medium where the data travels including wired (e.g., land and undersea cable) and wireless (e.g., radio, radio-relay, cellular, satellite) transmission means (US Joint Publication, 2018, IV9). The logical or "code" layer of cyberspace (Ibid, p. 6) refers to the logical instructions and software that operate communications traffic, such as domain name system (DNS) and Internet service providers (ISP). It consists of the connections that exist between network devices, including applications, data, and protocols, that allow the exchange of data across the physical layer. The cyber-persona/social/ideational layer is the sphere through which videos, images, sounds, and texts circulate. It consists of individuals and groups engaged in cyber activities, and operations targeting this layer are often referred to as "strategic communications" or, in the military realm, as "information operations" (Ibid).

The concept of cybersecurity is both about the insecurity created by and through this new space and about the processes, policies, procedures, regulations, standards, software, and hardware to make it (more) secure. In a sense, cybersecurity is associated with a set of activities and measures, both technical and non-technical, intended to protect both the ICTs and the information therein from unauthorized access or attempted access. The International Telecommunication Union (ITU), for instance, defines cybersecurity as "the collection of tools, policies, security concepts, security safeguards, guidelines, risk management approaches, actions, training, best practices, assurance and technologies that can be used to protect the cyber environment and organization and user's assets" (2008, p. 2). Over the years, the term cybersecurity is, thus, broadened beyond narrow technical concerns, such as the details of encryption, firewalls, and anti-virus software to include a wider variety of policy issues related to cyberspace security, ranging from protection of ICTs against a sabotage (cyberwar) to cyber-espionage and from cybercrime to cyber-terrorism, and from online privacy and content regulation (Mueller 2010, pp. 79, Nye 2014). Scholars of international relations have begun considering cybersecurity as an essential dimension of national security defining it as a "state' s ability to protect itself and its institutions against threats in and through cyberspace, including espionage, sabotage, crime and fraud, identify theft, and other destructive e-interactions and e-transactions" (Choucri 2012, p. 39).

The term "critical information infrastructure" (CII), building on the concept of "critical infrastructure" (CI), appeared in the early 2000s within this context, to denote the interconnected information systems and networks forming together a CI akin to electricity, finance, transport, communication, water supply, and other CIs (Wenger et al. 2002). There is no universal definition of what constitutes a CII – various organizations have provided their own conceptualization, including among others the OECD (2008), according to which CIIs are "those interconnected information systems and networks, the disruption or destruction of which would have a serious impact on the health, safety, security, or economic well-being of citizens, or on the effective functioning of government or the economy" (p. 4), and the Council of the European Union (2008), according to which CIIs are "ICT systems that are critical infrastructures for themselves or that are essential for the operation of critical infrastructures including telecommunications, computers/software, Internet, satellites, etc." (p. 12). The concept has gained prominence because CIs, including industries such as energy, water, and finance, depend increasingly on the Internet, terrestrial and satellite wireless networks, and other cyber-physical systems and networks for a variety of information management, communications, and control functions. In this sense, CII may be viewed as the digitalization of the telecommunication infrastructure (Wenger et al. 2002, pp. 7-8) and upon which other critical infrastructures rely. However, the concept of CII includes not only the telecommunications sector but also the information systems and networks of the operators of other critical infrastructures, thus covering not just a specific sector but also the important components scattered across all other critical sectors. This symbiosis according to Deibert and Rohozinski (2010, p. 20), has triggered internationalization of CI protection initiatives, policy coordination, and legislation, or in Nye's words have given rise to a "regime complex" through a wide variety of regional and international regimes and sub-state communities of practice. This evolving community of practice, at the regional, inter-state, and global levels, can be seen in the cybersecurity initiatives of the Group of Eight (G8), the Organization for Economic Cooperation and Development (OECD), the Organization for Security and Cooperation in Europe (OSCE), and the United Nations (UN). The following sections overview the norm entrepreneurship role of these intergovernmental organizations. The analysis is twofold, focusing, first, on the economic stream at the G8, OECD, and the UN's Second Committee and then on the politico-military stream at the UN's First Committee, the UN Security Council, and the OSCE.

## Economic Imperatives and the Emergence of the Critical Information Infrastructure Protection as a Cooperative Objective

The critical information infrastructure protection (CIIP) emerged as a cooperative object for the functioning of the global market economy since the disruption to global information networks meant, first and foremost, disruption to global capital markets. Given that the disruption of global information networks can have direct impact on businesses and communities across the borders and that attacks on interconnected cyber networks can have cascading effects across industrial sectors and national borders, the international policies are first and foremost, are thus, designed to support and sustain a friction-free global communications environment in which digital economy and trade can continue to grow, data can be exchanged without corruption, and CIs can operate without substantial interruption or disruption (Deibert 2002; Deibert and Rohozinski 2010).

The Group of Eight (G8), an intergovernmental political forum involving France, Germany, Italy, Japan, the United Kingdom, the United States, Canada, and Russia, has played the leading role in the construction of the norm on CIIP to secure the smooth functioning of global market economy. Top-level experts from G8 member states, together with the major information infrastructure operators (e.g., France Telecom for France), met in Paris in March 2003 for the first

multilateral meeting devoted to defining common principles for the protection of vital CII. The G8 members observed that information infrastructures increasingly form an essential part of CI and adopted the following principles for CIIP (G8 2003):

1. Countries should have emergency warning networks regarding cyber-vulnerabilities, threats, and incidents.
2. Countries should raise awareness to facilitate stakeholders' understanding of the nature and extent of their critical information infrastructures and the role each must play in protecting them.
3. Countries should examine their infrastructures and identify interdependencies among them, thereby enhancing protection of such infrastructures.
4. Countries should promote partnerships among stakeholders, both public and private, to share and analyze critical infrastructure information in order to prevent, investigate, and respond to damage to or attacks on such infrastructures.
5. Countries should create and maintain crisis communication networks and test them to ensure that they will remain secure and stable in emergency situations.
6. Countries should ensure that data availability policies take into account the need to protect critical information infrastructures.
7. Countries should facilitate tracing attacks on critical information infrastructures and, where appropriate, the disclosure of tracing information to other countries.
8. Countries should conduct trainings and exercises to enhance their response capabilities and to test continuity and contingency plans in the event of an information infrastructure attack and should encourage stakeholders to engage in similar activities.
9. Countries should ensure that they have adequate substantive and procedural laws, such as those outlined in the Council of Europe Cybercrime Convention of 23 November 2001, and trained personnel to enable them to investigate and prosecute attacks on critical information infrastructures and to coordinate such investigations with other countries as appropriate.
10. Countries should engage in international cooperation, when appropriate, to secure critical information infrastructures, including by developing and coordinating emergency warning systems; sharing and analyzing information regarding vulnerabilities, threats, and incidents; and coordinating investigations of attacks on such infrastructures in accordance with domestic laws.
11. Countries should promote national and international research and development and encourage the application of security technologies that are certified according to international standards.

With the adoption of these principles, the G8 member states suggested that the emergence of a new "security culture," considers protection of CIIs as essential for the protection of Cis, therefore encouraging them to strengthen international co-operation. These principles of protecting CII were later adopted by the UN General Assembly (UNGA 2003) and by the OECD (2007). The UNGA's Second Committee, the Economic and Financial Committee, has played an important role in diffusing the norm on CIIP as a cooperative objective at the multilateral level. The Second Committee, through its 'Global Culture of Cyber-security' initiative, endorsed by a series of UNGA resolutions adopted in 2002, 2003, 2009, reflected a consensus of basic international principles on cybersecurity and initial signs of norm emergence around CIIP (UNGA 2002, 2003, 2009). The resolution on "Creation of a global culture of cybersecurity and the protection of critical information infrastructures" (58/199), prepared under the United States' leadership and co-sponsored by a total of 69 countries including China, but not Russia, was adopted in 2005. The resolution emphasized the link between CIs and CIIs and outlined what it considered as the key elements of CIIP in an annex. The annex based on the 2003 meeting of the G8 Ministers of Justice and Interior listed the following key elements for protecting CIIs:

1. Having emergency networks regarding cyber-vulnerabilities, threats, and incidents.
2. Examining information infrastructures and the interdependencies between them.
3. Promoting partnerships, including the sharing of information, between public and private stakeholders.
4. Having adequate substantive and procedural laws and trained personnel to enable effective investigations and prosecutions in response to attacks.
5. Engaging in international cooperation to secure critical information infrastructures.

Another UN Resolution (64/211) adopted in 2009 entitled "Creation of a global culture of cybersecurity and taking stock of national efforts to protect critical information infrastructures" invited member states to use the voluntary self-assessment tool for national efforts to protect critical information infrastructures and strengthen their cybersecurity (UNGA 2009). The self-assessment tool included the following headings: "taking stock of cybersecurity needs and strategies," "stakeholder roles and responsibilities," "policy processes and participation," "public-private cooperation," "incident management and recovery," "legal frameworks," and "developing a global culture of cybersecurity." The resolution was sponsored by the United States on behalf of 39 other countries. Russia and China did not co-sponsor this resolution. Yet, in 2015, the UN Group of Governmental Experts, in which both Russia and China were represented, agreed on a consensus report that said that "states should take appropriate measures to protect their critical infrastructure from ICT threats" taking into account the General Assembly resolution on "creation of a global culture of cybersecurity and the protection of critical information infrastructure" (UN GGE 2015, para. 13 g).

The Organization for Economic Cooperation and Development (OECD), an intergovernmental economic organization with 37 member states, has been actively involved in the cybersecurity domain since 2002 as part of their attempt to address the challenges and exploit the opportunities of globalizing world economy. The OECD published several influential white papers, including "Guidelines for the Security of Information Systems and Networks" (OECD 2002) and "Promotion of a Culture of Security for Information Systems and Networks" (OECD 2005). These guidelines have been followed by a report on "The Development of Policies for the Protection of Critical Information Infrastructures" (OECD 2007). The Report analyzes similarities and differences across countries in areas such as how the policies are developed, what they include, risk management practices, strategies to mitigate vulnerabilities and monitor threats, roles and responsibilities, cross-border cooperation, public-private cooperation, and information sharing at the international level. The next year, the OECD (2008) adopted the Recommendation on the Protection of Critical Information Infrastructures (called the "2008 CIIP Recommendation") largely based on the findings of a comparative analysis of policies in seven OECD countries in 2006–2007. As the first international legal instrument in this area, the 2008 CIIP Recommendation adopted on the proposal of the Committee on Digital Economy Policy, set out a high-level framework for the development of national strategies to protect CII and thereby played a key role in raising awareness about the issue. The 2008 CIIP Recommendation identifies the need for a national operational infrastructure security capability, a willingness and ability to share information to address cross-border issues, close cooperation with the relevant parts of the private sector, and a strong culture of security in the face of rapid technological growth and consequential social changes. The review of the 2008 CIIP Recommendation on the basis of the Recommendation on Digital Security Risk Management for Economic and Social Prosperity (OECD 2015) resulted in the Recommendation on Digital Security of Critical Activities (OECD 2019), which updates and replaces the 2008 CIIP Recommendation. The new Recommendation focuses on services, functions, or activities that are critical to the economy and society rather than on the information infrastructure assets that support these services. This evolution reflects a paradigm shift from a technical risk management approach to a "service approach," reminiscent of

the transition that occurred from the 2002 Security Guidelines to the 2015 Security Risk Recommendation. The most recent OECD Recommendation (2019), reflecting this transition, sets out a range of policy recommendations to ensure that policies targeting operators of critical activities focus on what is critical for the economy and society. These include the adoption of an overarching policy framework; promoting and building trust-based partnerships; and improving cooperation at the international level.

## National Defense Imperative and the Emergence of the Norm Prohibiting Cyber-operations Against the Critical Information Infrastructures

The need to tackle threats to CII has resurfaced as a national security imperative with the rise of allegedly state-sponsored cyber-operations targeting CIs in several countries, such as in Estonia in 2007, Georgia in 2008, and Iran in 2010. The North Atlantic Treaty Organization (NATO), shortly after the attacks in Estonia, established the Cooperative Cyber Defence Centre of Excellence in 2008 in Tallinn; defined the cyberspace as an operational domain equal to land, air, sea, and space at the Warsaw Summit of 2016; and engaged in developing a collective cyber-defense strategy including both offensive and defensive operations. The member states, in turn, have started to establish troops within their military structures that can fight cyberspace. It is estimated that approximately 140 countries have developed, or are developing, a capacity to wage cyber armed conflict. Eighty-six nations have already published National Cyber Security Strategies (NCSS) in which most of them employed a similar justification pointing to society's growing dependence on ICTs, the vulnerabilities that exist in these systems, and the steps that need to be taken to secure cyberspace to keep it functioning as the infrastructure of the global political economy and national security (Deibert and Rohozinski 2010). Many of the published NCSS identified the protection of CIs as a strategic objective and have shown their interests in international cooperation for the protection of CIs (Kaska and Trinberg 2015; Romaniuk and Manjikian 2021). Several states have explicitly mentioned ICT and communications among the services making up CIs, established new institutions or extended the mandate of existing ones to oversee CIIs, and developed teams of individuals that may respond in case of emergency, referred to as computer emergency response teams (CERTs) or computer security incident response teams (CSIRTs). These teams are often characterized by strong public-private partnerships (PPP) as many CIIs are in the hands of the private sector.

At the multilateral level, perhaps the most noteworthy developments have been taken place in the UNGA's First Committee, the Disarmament and International Security Committee, which can be regarded as a unique forum for key players such as the United States, China, and Russia to discuss the "high end" of information security threats. The First Committee focuses on the politico-military or cyberwar dimension of global cybersecurity since Russia's draft resolution on "Developments in the field of information and telecommunications in the context of security" in 1998 (Russian Federation 1998). The Russian-initiated focus on the use of ICT technologies that are inconsistent with the objectives of maintaining international stability and security was broadly supported and steered, 4 years later, to the authorization of the UN Group of Governmental Experts (UN GGE) "to consider existing and potential threats in the sphere of information security and possible cooperative measures to address them" (UNGA 2002). Six UN GGE have been created since then, and one of the few accomplishments of the UN GGEs was the agreement in 2015 on a set of eleven norms of responsible state behavior in cyberspace. These norms, subsequently supported in a UNGA resolution (70/237), encouraged states to be guided by the UN GGE Report in their use of ICTs (UNGA 2015). Prominent among these norms was one that prohibited cyber-attacks against CI on which the public depends. The consensus report of a UN GGE (2015) stated that "a state should not conduct or knowingly support ICT activity contrary to its obligations under international law that

intentionally damages critical infrastructure or otherwise impairs the use and operation of critical infrastructure to provide services to the public" (para.13f). A further major restraint norm was set out to the effect that "states should not conduct or knowingly support activity to harm the information systems of another state's CERTs and should not use their own teams for malicious international activity" (para. 13 k). The report also requires states to "respond to appropriate requests for assistance by other states whose critical infrastructure is subject to malicious ICT acts" and to "respond to appropriate requests to mitigate malicious ICT activity aimed at another State's critical infrastructure emanating from their territory" (para. 13 h). These measures establish obligations under international humanitarian law not to target crucial infrastructure for the public and recognize a kind of a "protective status" for the CERTs similar to that given to medical personnel and facilities under international humanitarian law.

These norms recommended by UN GGE in 2015 were also supported or approved by other international organizations, including the G7 (2016), G20 (2015), the OSCE (2016a), and the Association of Southeast Asian Nations (ASEAN 2017), and supported by multi-stakeholder initiatives, such as the Paris Call for Trust and Security in Cyberspace (2018) and the Global Commission on the Stability of Cyberspace (GCSC 2018, 2019). The GCSC (2018), building on GGE's norm to protect CI, proposed a norm to protect the public core of the Internet, which refers to such critical elements of the Internet infrastructure as packet routing and forwarding, naming and numbering systems (the DNS), the cryptographic mechanisms of security and identity, transmission media, software, and data centers. The proposed norm gathered strong support from civil society, and many liberal democracies participated in the meetings of the UN's Open-Ended Working Group (OEWG) on developments in the field of information and telecommunications in the context of international security (2019–2020).

The UN Security Council (UNSC) has been dealing with CI issues within the context of cyber-terrorism and hybrid-wars. The UNSC was briefed on the use of ICTs and international security for the first time in 2016 through an "Arria formula" meeting which involved the participation of representatives from governments, regional organizations, the private sector, and civil society (What's in Blue 2016). In the meeting, the potential of state use of ICTs in fueling political or military tensions and the importance of the protection of ICT-dependent CI were considered. In 2007, a second Arria formula meeting was organized on the issue of "hybrid wars as a threat to international peace and security" focusing on the changing character of warfare driven by the "increasing use of new technologies and strategies" (What's in Blue 2017). The same year, the UNSC (2017) adopted resolution 2341 on the protection of CI against terrorist attacks, which recognizes cybersecurity as an important element of protection. In 2018, the UN Security Council Counter-Terrorism Committee Executive Directorate (UN CTED) conducted significant work in cooperation with INTERPOL and the UN Office of Counter-Terrorism, on protecting CI against terrorist attacks – including the publication of the Compendium of Good Practices on the Protection of Critical Infrastructures Against Terrorist Attacks (UN CTED and UN OCT 2018). The UN CTED (2020) launched and supported the project Tech Against Terrorism to help the global tech industry protect itself from terrorist exploitation of CIs.

The OSCE, the world's largest security-oriented intergovernmental organization with 57 participating states, deals with cybersecurity issues in relation to counter-terrorism and cybercrime. The process of integrating aspects of ICT and terrorism into the organization's activities started with the adoption of the OSCE Charter on preventing and combating terrorism (2004) that includes paragraphs on the prevention of media and information technology abuse for terrorist purposes. The OSCE Monaco Declaration ( 2012) called for the OSCE to "organize an exchange of views and best practice on confidence- and security-building measures, including in the area of cyber security and counter-terrorism, with a view to exploring the possibility of building new OSCE commitments." In 2012, the Permanent Council of the OSCE

established a cross-dimensional OSCE Working Group. A first set of 11 confidence-building measures (CBMs) to reduce the risks of conflict stemming from the use of ICTs was adopted by the Permanent Council Decision No. 1106 (OSCE 2013). In March 2016, participating states agreed on an additional five CBMs addressing, among other issues, joint efforts to effectively mitigate cyber-attacks on critical infrastructure that could affect more than one participating state. Concerning the CIIP, the members of the OECD agreed in March 2016 to "develop shared responses, including crisis management procedures," "adopt voluntary national arrangements to classify ICT incidents in terms of the scale and seriousness of the incident," "share national views of categories of ICT-enabled infrastructure that OSCE participating states consider critical," "improve the security of national and transnational ICT-enabled critical infrastructure including their integrity," and "raise awareness about protecting industrial control systems" (OSCE 2016a). Most recently, the decision on OSCE efforts related to reducing the risks of conflict stemming from the use of ICTs adopted at the 23rd Ministerial Council in Hamburg in December 2016 has provided further guidance to future activities in this field (OSCE 2016b). These measures focused on further enhancing cooperation between participating states, to effectively mitigate cyber-attacks on CI that could affect more than one participating state. The 2017 OSCE Chairmanship under Austria continued efforts of previous chairmanships to foster the protection of critical infrastructure as a key concern of national security, by organizing a conference to take stock of potential cyber threats to critical infrastructure and their consequences, and to explore how public-private partnerships in critical infrastructures can deal with potential cyber threats. The discussions brought together representatives of the OSCE's 57 participating states, the OSCE's Partners for Co-operation, policy-makers, and business executives, as well as experts, in Vienna and indicated a consensus that effectively protecting critical infrastructure from cyber threats must be a priority for international efforts to enhance cyber stability between states (OSCE 2017).

## Conclusion

Securing cyberspace has become one of the major global policy areas of the twenty-first century. Both states and other stakeholders have sought to increase stability for cyberspace by creating a new ecosystem of "cyber norm" processes in diverse fora and formats. This article focusing on the efforts of four intergovernmental organizations showed that the political economy and national security imperatives of critical infrastructure have always informed international cybersecurity norm processes and policies. The article showed that there is a growing international consensus on cyberspace as vital to economics and national security, a steady internationalization of critical infrastructure protection initiatives, policy coordination, and legislation and an emerging norm on CIIP. The article focused first on how the economic imperatives have initially driven the logic behind the protection of CIIs as a cooperative objective for maintaining global political economy by examining the multilateral efforts in the G8, UN's Second Committee, and the OECD. This section showed that international efforts to secure interconnected information systems and networks aimed first to support a friction-free global communications environment in which digital economy and trade can flourish and critical infrastructures can operate without significant downtime or disruption. It has also underlined the recent paradigm shift in international CIIP from the protection of information systems and networks (i.e., the information infrastructures or assets) to the economic and social activities (i.e., the services or functions) that rely on them. The article then, focusing on the national and transnational security dimension of CIIP, argued that emerging norm around CIIP can be seen most clearly in the limits that shape states' offensive operations in cyberspace. While this article has only been able to offer a somewhat limited account of the activities of the international actors in this area, it nevertheless has showed important achievements in the work of the range of organizations, agencies, and bodies of the UN and the OSCE and in the number of resolutions and decisions adopted by both organizations. The

analysis of those multilateral efforts shows not only a growing recognition of the mutual interdependence generated by cyberspace but also the emergence of an international norm prioritizing the CIIP and prohibiting cyber-attacks against critical infrastructure on which the public depends. Although protection of national CIIs is obviously first priority among states worldwide, there is a growing "community of practice" in the area of critical infrastructure protection that is spreading internationally and a growing acknowledgment that cyberspace cannot truly be secured unilaterally.

# Global Economic Governance

Hongsong Liu
School of International Relations and Public Affairs, Shanghai International Studies University, Shanghai, China

## Synonyms

Global finance; International economic governance; International trade

## Definitions

*Global Economic Governance* can be defined as the international rule-based framework through which economic actors seek to resolve collective action problems and promote cross-border coordination and cooperation in the provision or exchange of goods, money, services, and technical expertise in defined issue areas of the world economy.

## Introduction

Global governance is characterized with states' and nonstate actors' governance activities without global government. It involves the provision of government-like services – in particular the supply of public goods – at the international level. In the absence of global government, it is hard to effectively solve global problems in various issue areas. Yet calls for greater global governance have in fact been associated with an impressive series of attempts to provide government-like services at the global level (Frieden 2012: 1). Accordingly, global economic governance involves the provision of public goods in the global economy. It can be defined as the international rule-based framework through which economic actors seek to resolve collective action problems and promote cross-border coordination and cooperation in the provision or exchange of goods, money, services, and technical expertise in defined issue areas of the world economy (Moschella and Weaver 2014: 4).

## The Architecture of Global Economic Governance

Global economic governance has become more complex over the past 20 years. The range of issues that require global coordination include not only traditional issues like trade and monetary affairs but also topics which were once viewed as falling exclusively within a state's domestic jurisdiction, such as banking regulation, inclusive green growth, youth employment, and domestic resource mobilization.

International organizations have been identified as focal points though which member states can negotiate the terms on which global governance takes place. While no longer limited to intergovernmental forums, international organizations such as World Trade Organizations (WTO), International Monetary Fund (IMF), and World Bank remain premier venues of global governance in which international rules are elaborated, decisions are made, and agreements are enforced. The liberalism of the current order is reflected in institutional anchors such as the trade liberalization rules of the WTO, the commitment to capital mobility of the IMF, and economic policy advice favoring market coordination and privatized development (the "Washington Consensus"). International organizations therefore serve as important thermometers for the broader politics of global governance (Stephan 2014: 915).

Following World War II, the primary actors in global economic governance were the Bretton Woods institutions including the IMF, the World Bank, the General Agreement on Tariffs and Trade, and its successor – the WTO. Over the following decades, the number of key actors in global economic governance grew to include the Group of Seven/Group of eight (G7/G8) and international standard-setting bodies in global financial regulation (Bradlow 2013: 973–974). An important characteristic of the Bretton Woods system was that the IMF, the formal

international organization charged with promoting international monetary cooperation, did not evolve into the central forum for financial regulatory cooperation. Instead, starting in the 1970s, financial regulators from major markets approached counterparts in other countries to manage the policy challenges of the nascent globalization of finance. Well-resourced agencies – e.g., the Federal Reserve, the Bank of England, and the Securities and Exchange Commission (SEC) – led the way in constructing the web of forums including the Basel Committee on Banking supervision (BCBS), the International Organization of Securities Commissions, the International Association of Insurance Supervisors, and the International Accounting Standards Board (IASB) (Brummer 2012; Davies and Green 2008; Porter 2005).

## The Emergence of the G20 as a Premier Forum in Global Economic Governance

Prior to 2008, the overall manager of the global economy was the G7/G8. In 1999, in the wake of the Asian Financial Crisis, the G7/G8 recognized that it could not manage the crisis on its own, and its leading members invited the ministers of finance from a select group of countries and the European Union to meet. In a couple of months, Asian Financial Crisis spread from Thailand to Indonesia and South Korea. Even the USA was involved in this crisis in August 1998, which led to the bankrupt of the US Long-Term Capital Management Corporation. As a consequence, the G7/G8 members were aware that there were not able to maintain the stability of global financial system on their own in the era of economic globalization. Moreover, it amounted to a public acknowledgement that the G7/G8 was no longer capable of managing the global economy and needed to share the responsibility with a broader group of countries (Bradlow 2013: 976).

Therefore, they decided to dialogue with emerging market economies on equal footing, resulting in the formation of G20 Ministers of Finance and Central Bank Governors. On 15–16 December 1999, Ministers of Finance and Central Bank Governors of 19 systematically important countries in the international economic system and the EU met to take part in the first G20 meeting in Berlin, leading to the formation of the G20. In 2008, a major global financial crisis erupted in the Wall Street in the USA. In only a few months, the crisis diffused from financial sectors to real economy and spread to other major economies around the world. The G7/G8 was not able to respond to the crisis in an effective way. The limited scope of the G8 members ruled out the participation of emerging powers, which could play a major role in solving this global problem collaboratively. Against this background, the G7/G8 members decided to upgrade the G20 from the ministerial level to the summit level. On 14–15 November 2008, the G20 leaders gathered to discuss the management of global financial crisis and global economic governance in Washington and were "determined to work together to restore global growth and achieve needed reforms in the world's financial systems." This led to the formal birth of the G20 summit.

With the rapid growth of the emerging powers' economy, the global economic system is significantly influenced by the views, interests, and requirements of these powers. It is clear that the problems of global imbalances, economic recession and recovery, and financial system reform cannot be solved without involving emerging market economies. It has been fortunate that the G20 emerged as a premier forum, and this could be the most profound evolution in global economic governance over the last couple of decades. It represents the first adaptation of the global governance structure to reflect dramatic changes in the distribution of power since the end of the Cold War. It is also the only forum in which major established and emerging players meet in a setting of formal equality. As the global economy was besieged in crisis, it is important to ensure the sustainability of the current system and avoid its collapse. This should include efforts to reform the IMF to make it a more effective institution for

bilateral and multilateral surveillance and as an international lender of last resort. The success on both front crucially depends on the effectiveness of global economic governance and the role of the G20 which emerges as a premier forum for international economic cooperation in the aftermath of global financial crisis (Cho 2012: 12). As Patrick says, "the G20 has the potential to shake up the geopolitical order, introducing greater flexibility into global diplomacy and transcending the stultifying bloc politics that have too often hamstrung cooperation on global governance in formal, treaty-based institutions, including the United Nations" (Patrick 2012).

## The Legitimacy of the G20: Challenges Ahead

In contrast to the G7/G8 membership, the G20 includes all the systematically important counties such as the largest emerging economies of China, India, and Brazil. Therefore, legitimacy and representativeness may not be an important hurdle for the G20 to function as a global governance forum. There is no clear reason why those 20 particular leaders should sit around the table, but any other selection would face similar questions. The G20 seems to be a reasonable grouping as it is balanced between advanced and emerging economies, and regionally.

Although the representativeness of the G20 is much higher than that of the G7/G8, many middle and small powers criticize the G20 for its lack of representativeness. They demanded for more representativeness while recognizing the role of the G20 in global economic governance. Facing the criticisms of those middle and small powers, the G20 justified its legitimacy on the ground that the legitimacy of the G20 is attributable to its economic power and the broad scope of its membership as well as its strength in managing global economy. Nevertheless, this justification has not given a satisfactory answer to the question of how the nonmembers are represented in the G20. As it is the major concern of the middle and small powers, the G20's justification has not relieved its pressure resulting from the lack of legitimacy.

The G20 plays a leadership role in global economic governance primarily by converging the members' different preferences into a single political consensus (as far as possible). Although international agreements reached in the G20 summits are not legally binding, they matter precisely because they reflect the political consensus of the members. In the ensuing actions, some international organizations may put the political consensus into practice and implement the international agreement reached in the G20 summits. These international organizations include the IMF, World Bank, WTO, UN, the International Labor Organization (ILO), the Financial Stability Board (FSB), and the Organization for Economic Cooperation and Development (OECD). If the international agreements were implemented, global economic governance would be reformed in the direction set by the G20. In the process of implementing the G20 agreements, nonmembers' disagreement with the legitimacy of the G20 would result in their noncooperative attitudes, thus exerting negative impact on the effectiveness of the G20.

A high level of legitimacy is helpful for the effectiveness of an international institution. Conversely, a high level of effectiveness can help to improve members' and nonmembers' identification with the legitimacy of an international institution. Actors' loyalty for a particular institution is partly attributable to the actual and predictable welfare the institution generates. Furthermore, the fact that the actors have not found and expected to find a more efficient alternative institution would contribute to reinforcing the legitimacy of the institution (Reus-Smit 2007). The G20 performed well in responding to the global financial crisis and played a significant role in solving the collective action problem when coordinating the members' macroeconomic policies (Buekley 2014; Callaghan et al. 2014). This could help the members and nonmembers form a positive expectation of the G20's welfare-improving effect and therefore make them more confident in the G20, leading to the members'

and nonmembers' increased identification with the legitimacy of the G20. To some extent, this reduced the legitimacy pressure facing the G20.

Having fulfilled the tasking of managing the global financial crisis, the G20 is evolving from an improvised crisis management institution to a steering committee in global economic governance. It is evident that while the G20 leaders discussed the issues of macroeconomic coordination, international financial market regulation, international financial institutions reform, and international monetary system reform which focus on managing the global financial crisis in the first three summits, the issues less relevant to the crisis management, such as development aid, energy security, food security, and commodity price volatility, were included in the agenda from the G20 Toronto summit taking place in June 2010 onward. The proliferation of the issues discussed in the G20 along with the weakening disciplinary effect of the global financial crisis would exert a negative impact on the effectiveness of the G20.

The disciplinary effect stemmed from the strong sense of urgency of the G20 members facing the crisis. When the G20 members responded to the crisis collectively, the strong sense of urgency prompted them to reach political consensus and coordinate their policies. After the crisis became less urgent, the weakening disciplinary effect made it hard for the G20 members to reach political consensus. As such, in the process of transforming from an improvised crisis management institution to a steering committee, the G20 is no longer able to employ the disciplinary effect of the crisis to facilitate the formation of the political consensus and the convergence of the members' different preferences. This would damage the effectiveness of the G20.

In addition, the proliferation of the issues discussed in the G20 reduced the members' compliance pressure, which would further damage the effectiveness of the G20. Although the G20 members do not have legally binding obligation in complying with their commitments, there are institutional arrangements designed to ensure a relatively high level of compliance. In an attempt to facilitate the members' compliance with their commitments, the G20 has established a procedure of peer review, in which the G20 leaders can review other members' level of compliance. The G20 members showing less compliance with their commitments would face a situation of naming and shaming, thus putting compliance pressure on them.

Due to the proliferation of the issues discussed in the G20, the number of commitments on the leaders' table increased substantially. For this reason, it is hard for the G20 leaders to conduct the work of peer review well in limited time. Furthermore, as the G20 leaders have to rely on relevant expertise to review other members' level of compliance, the proliferation of the issues enlarges the gap between the leaders' expertise in hand and the required one, which inevitably reduces the quality of peer review. Because of the decreased quality of peer review, even if a G20 member receives a negative review result, it is very hard for other members to use the tactic of naming and shaming convincingly. As a result, the peer review procedure puts less compliance pressure on the G20 members. Given that the peer review procedure cannot put sufficient compliance pressure on the G20 members, it has been not able to perform well in facilitating the members' compliance with their commitments. Hence, the G20 is becoming less effective in solving various problems in global economic governance.

The above analysis suggests that the G20 is becoming less effective than that in hard time. It implies that it is hard for the G20 to rely on a high level of effectiveness to reduce its pressure resulting from the lack of legitimacy and that the G20 has to improve its legitimacy by other means. Although the G20 is in need of improving its legitimacy by reforming itself, the reform could not be conducted at the expense of damaging its effectiveness. There are two reform measures through which the G20 can improve its legitimacy while not damaging its effectiveness. The first reform measure is to strengthen the peer review procedure in the G20 ministerial meetings. The

second reform measure is to institutionalize the linkage between the members and nonmembers.

Due to the limited time and the G20 leaders' limited expertise, the peer review procedure in the G20 summits is not able to put sufficient compliance pressure on the members after the G20 evolved from an improvised crisis management institution to a steering committee. In order to solve this problem, the G20 needs to conduct peer review for the members' compliance with their commitments in the ministerial meetings. On the one hand, as the issues discussed in the G20 ministerial meetings focus on specific policy fields, the G20 ministers have more time to review other members' compliance in these fields. On the other hand, the G20 ministers have relatively sufficient expertise and management experiences in the policy fields they are responsible for, thus ensuring the quality of peer review. As such, the G20 can conduct peer review in the ministerial meetings to put more compliance pressure on the members. Having covered the policy fields of finance, energy, development, labor, and employment, the G20 ministerial meetings can facilitate the member's compliance in these fields by conducting peer review. In addition, the G20 needs to hold ministerial meetings in other policy fields and conduct peer review in the newly held ministerial meetings, thus broadening the scope of compliance pressure put by the peer review procedure in the same pace as the issues discussed in the G20 are proliferating. By strengthening the peer review procedure in the G20 ministerial meetings, the G20 in transition can maintain a high level of effectiveness and therefore continue to use its effectiveness to reduce the pressure resulting from the lack of legitimacy.

For an informal international institution like the G7/G8 and the G20, accepting more members is not the sole way to improve its representativeness. The G7/G8 has sought to establish dialogue mechanism with large developing countries. In 2007 G7/G8 summit, this dialogue mechanism was set up as the Heiligendamm process. Like the G7/G8, the G20 has adopted the strategy of institutionalizing the linkage between the members and non-members to improve its representativeness. Some non-members were invited to attend the G20 summits for the purpose of making their voice heard. Also, the G20 has attempted to improve its representativeness by letting the members express concerns on behalf of the non-members in their regions. For instance, some G20 members participated in the outreach program to realize proxy representation, discussing with the non-members in their regions regularly. Australia is one of the participants of the outreach program. The Australian government expressed its willingness to hold outreach meetings with its neighbors for the purpose of ensuring that the decisions in the G20 reflect the interests of its region. Although these measures provided the non-members with opportunities of being represented in the G20, the linkage between the members and non-members remains less institutionalized. A higher level of representativeness requires that the G20 should institutionalize the linkage between them. The G20 can set up a dialogue mechanism between the members and some key non-members like the Heiligendamm process. In doing so, the legitimacy of the G20 can be improved while not damaging its effectiveness.

## Conclusion

In the aftermath of the global financial crisis in 2008, the G20 emerged as a primier forum in global economic governance. Because of the lack of representativeness, the legitimacy of the G20 was questioned by many non-members. The lack of legitimacy exerted negative impact on the effectiveness of the G20. For the G20 aimed at effective governance, this negative impact is not negligible.

The impressive performance of the G20 in managing the global financial crisis reduced its pressure resulting from the lack of legitimacy. When the G20 is evolving from an improvise crisis management institution to a steering committee in global economic governance, however, it is hard for the G20 to maintain a high level of

effectiveness due to the weakening disciplinary effect of the crisis and the proliferation of the issues discussed in the G20 (Cooper 2010). This made it hard for the G20 to take advantage of a high level of effectiveness to reduce its legitimacy pressure. In order to improve its legitimacy, the G20 needs to strengthen the peer review procedure in the ministerial meetings and institutionalize the linkage between the members and nonmembers. If the G20 was successfully carried out toward the direction of improving its legitimacy, it would become a real steering committee in global economic governance.

## Introduction

This entry was written during the Covid-19 pandemic between January and July 2020. This is an important element in the quest for academic attainment and success. No one knows at this point how the lives of college students and their families will change in the coming months; however, we make note of it because academic success will look very different in 2021 and possibly into the future.

The researchers have taught more than 3000 students at the following universities: Columbia University (New York), DePaul University, Illinois Institute of Technology, Roosevelt University, Rush University, and the University of Illinois at Chicago (Illinois), and we have learned information is the key element in spurring a student to success. When we say information, we

mean information regarding admission to academic programs, information to navigate through the academic system (financial aid, classes to take, research assistantships, social-emotional supports, for example), opportunities for fellowships, and networking information and other professional associations that will lead to training and gainful employment. While the pandemic has made alterations in student plans, it has been our experience that students with the strongest "community assets" will be the victors.

During 2015–2018, one member of the research had the opportunity to work on two evaluations with the University of Illinois at Chicago. The studies were both under the auspices of the School of Public Health and funded by the Department of Health and Human Services. One was a pipeline program to attract students from underrepresented groups who were low-income or were from rural areas that had limited access to healthcare careers. The second study was devoted to Latinx students. The hope was that the Latinx students would be trained to deliver healthy eating options to communities with large Latinx populations in Chicago to encourage health eating options that would lead to a reduction in obesity.

The studies will be discussed simultaneously through the lens of the 5 Essential Supports for Student Learning after a review of the University of Illinois at Chicago and the campuses place in the academic world of Chicago.

## Background of University of Illinois at Chicago

The University of Illinois at Chicago is the largest university in the Chicago area. It services 27,000 students within 15 colleges and schools including Applied Health Sciences, Architecture, design, and the Arts, Business Administration, Dentistry, Education, Engineering, Graduate, Honors, Liberal Arts and Science, Nursing, Pharmacy, Public Health, Social Work, Urban Planning and Public Affairs, and the College of Medicine. The largest branch of the four branches of the College of Medicine is the Chicago campus. The annual research expenditure of the Chicago campus exceeds $340 million, and UIC is one of five doctoral research universities in the State of Illinois. The University of Illinois at Chicago Medical School and its affiliated healthcare operations is a critical provider of healthcare in the region and the public medical center serves as the principal educator of Illinois' physicians, dentists, pharmacists, nurses, and other healthcare professionals.

The modern UIC was formed in 1982 by the consolidation of two University of Illinois campuses: the Medical Center campus, which dates back to the nineteenth century; and the comprehensive Chicago Circle campus, which in 1965 replaced the two-year undergraduate Navy Pier campus designated to educate returning veterans. The consolidation and expansion are why UIC is the preferred shortened name today. The UIC student body is recognized as the nation's 11th most diverse, and it reflects the global character of Chicago.

The University of Illinois at Chicago provides an array of social service, training, and education opportunities to members of the Chicago community, the State of Illinois, the United States, and internationally.

As one of the largest producers of health professionals in the country, it places a significant focus on health science in ethnically and economically diverse populations. The fall 2014 campus profile of students indicates the undergraduate enrollment was 34.3% representing Black and Latino students compared with 35.8% white (UIC OIR, 2015). This report from the Office of Institutional Research at the University of Illinois at Chicago goes onto to report a steady increase in the Latino student population from 10% in 1980 compared to 26% in 2014; there is a contrasting steady decline for Black students, 20% in 1980 compared to 8% in 2014. The UIC graduate and professional colleges, Black and Latino students make up only 17% and 18%, respectively. A large subgroup of nontraditional students at UIC is the student veteran population. There are over 500 students who are veterans and most of them have had combat experience. Most of these nontraditional students at UIC are male and enrolled in

undergraduate programs. They have also taken advantage of educational opportunities elsewhere before coming to UIC.

## The Health Professionals Network (Pipeline Program)

Chicago, the largest city in Illinois and the third largest city in the United States, has suffered from the lack of physicians, dentists, and public health practitioners. As Dotson, Currence, and Pendleton (2014) reported in the UIC-HPN proposal submission, the Health Resources and Services Administration have 27 HPSAs in Chicago to improve the health outcomes of minorities and the poor in the city and beyond. The University of Illinois at Chicago Schools of Public Health, Medicine, and Dentistry are committed to educating and training a multicultural student body. The Urban Health Programs embedded in each of these colleges complements the campus goals of diversity and addresses the state and societal health care issues.

Dotson, Currence, and Pendleton go on to report the current state of the economic environment in the state of Illinois. Coupled with existing barriers that students of color encounter in university admission, matriculation, and accessing financial aid, the situation could prove dire for students who desire a career in the healthcare professions. The University of Illinois at Chicago has a strong record in recruiting, retaining, and graduating minority health professionals. Their commitment to performing better in this area resulted in the submission of the proposal to enhance the training of minority students in the healthcare professions.

The HRSA Health Careers Opportunity Program (HCOP) project, *The University of Illinois at Chicago Health Professions Navigator (UIC-HPN),* focused from 2016 to 2019 strengthening practice-based experiences, continuous mentoring/social support, financial support, and academic preparation that are preparing underrepresented disadvantaged minority students and veterans to successfully navigate their way to the healthcare professions.

## Hispanic Public Health Nutrition Initiative (Obesity Program)

The School of Public Health at the University of Illinois at Chicago received a four-year grant from the National Institute of Food and Agriculture to retain, train, service, and enhance the nutrition studies of Latino students in Chicago and, as an outgrowth, extend their knowledge to the Latino community. The principal investigator, Dr. Jesus Ramirez-Valle, recruited three students with roots in the Latino community who were from Illinois and California in Year 2 of the grant. Their experiences with the Initiative have advanced their professional acumen and resulted in information sharing. The fellows felt their engagement with various communities in Chicago and their identification with the residents provided a mutually beneficial outcome to future eating habits of area residents.

During Year 3, three additional students were recruited under the grant. These students were equally sophisticated and extolled the virtues of healthcare professionals with a determination to give back to their respective communities.

A component of the study was to develop an online curriculum on Nutrition that could be accessed by the students from Years 2 and 3. The academic component was developed by four very sophisticated and highly prepared faculty in medicine, nutrition, and public health. The collaboration between this group of faculty members resulted in a well-organized, rigorous, and step-by-step component of a Nutrition course that conforms to an introductory course for the uninitiated student.

In total, there were 12 students recruited to the program over the course of 3 years. The students in the Hispanic Public Health Nutrition Initiative shared many of the attributes of the students in the Health Professional Careers Network: family and community partnerships; school leadership; instructional program; staff development and collaboration; and school environment/culture.

## Objectives and Methodology

The objective of both programs was to increase the number of students in the healthcare pipeline.

Based on a review of Years 1, 2, and 3 of the Hispanic Public Health Nutrition Initiative (HPHN) also known as the Obesity Project, and the Health Professions Navigator Program (HPNP) also known as the Pipeline Project, the evaluator documented the progression of students during both initiatives. There were similarities in both groups of students.

The following research questions were identified at the beginning of the process and explored during Years 1, 2, and 3 of both studies. They are:

- How do programs under the Obesity Project, and the Pipeline Project foster academic and social abilities in participants?
- What short-term and long-term impact does involvement in the programs have on the lives of students involved in the program—after Years 1, 2, and 3?
- What does the successful completion of each program look like, and what indicators of success are used and how are they measured?

The researcher performed key informant interviews with all the medical students who participated in the Obesity Program. Due to the size of the Pipeline Program, the researcher performed key informant interviews with administrators and mentors. The researcher also conducted focus groups at the beginning of the Pipeline Program; key informant interviews with a select group of participants; focus groups at the end of the program; and attended every extracurricular program to conduct observation activities. Students also completed periodic surveys.

## Who Was Interviewed?

The Pipeline Project cast a wide net to recruit students. The Obesity Project was more selective and had a more intimate and close-knit group of already enrolled UIC professional students. The Obesity Program recruitment resulted in medical students who were Latinx and had an interest in combatting obesity. The Pipeline Project was less intentional about recruitment as it wanted to recruit and interest high school students in STEM opportunities; and to recruit undergraduate, and college graduates with a desire to attend dental, medical, or public health school. The following chart indicates the population of students.

## Information Gathering for Success – Three Year Journey to Completion

| Health Professionals Network | Student Recruitment and Completion | How Was the Student Interviewed |
|---|---|---|
| Year 1 recruitment | 206 | Via hand-held device; written survey |
| Year 2 recruitment | 184 | Via hand-held device; written survey |
| Year 3 recruitment | 298 | Via hand-held device; focus groups; written survey |
| TOTAL | 688 | |

| Hispanic Public Health Nutrition Initiative | Student Recruitment and Completion | How Was the Student Interviewed |
|---|---|---|
| Year 1 | 2 | Personal interview via phone |
| Year 2 | 3 | Personal interview via phone |
| Year 3 | 3 | Personal interview via phone |
| TOTAL | 8 | |

Source: UIC Attendance Sheets

## Findings

The researchers found a consistency in how the students matriculated to the UIC health programs: Internet announcements, word of mouth, academic advisors, and serendipity. The students who had developed a network of advisors, friends, and were aggressive in their internet searches

appeared to garner the most information to advance their academic careers. Those students with an academic network of advisors, professors, administrators, and friends were essential in information gathering.

A consistent theme in the stories the researchers heard was that students may be intentional in their search for academic opportunities or they may have garnered information by serendipity but they all need the ability to achieve success by information and having pointers to opportunity.

## Commonality in the Stories

The 688 students that matriculated through the Pipeline Program and the 8 students that matriculated through the Obesity Program had similar characteristics in terms of support. The chart below reflects the findings.

The key informant interviews and the focus groups revealed the students had supportive families and had developed "communities" that assisted them with information and social care. The attendees also had superior social skills that allowed them to ask for assistance and to ask questions when they became stuck. The family supports, the social skills of the attendees, and their networking skills allowed the attendees the latitude to seek out recruitment efforts, financial support, and to be on a continuous path to develop their skills. These elements applied to all the students and crossed gender.

### Student A

Student A grew up California with both parents and a younger sibling. She attended high performing grammar and high schools in the Fullerton area and attended the University of California-Fullerton. She has a Bachelor of Science in Health Science with a minor in Philosophy. She is currently enrolled in the in the Coordinated Master's Program for Nutrition at UIC-SPH. Her career goal is to be a Dietitian and return to California where most of her family resides.

Student A has taken full advantage of every internship available while at UIC. She has interned with the Heartland Alliance, with the Chicago Partnership for Health Promotion, and with the Public Health Institute. She has also served as a Research Assistant with the School of Public Health. Student A thought the online curriculum was instrumental in filling in the gaps of her nutrition knowledge. Student A was able to communicate with the faculty team that created the online program.

Student A indicated her interest in Nutrition was the result of a family history of diabetes. Student A is particularly concerned about diabetes in the Latino community and would like to be a part of the healthcare community that combats this issue.

### Student B

Student B grew up in Racine, Wisconsin. Student B is a member of a small supportive family that has encouraged her interest in public health. She attended Burlington High School and performed well in math and science while there. Student B received her undergraduate degree at UIC, and she served as the TA for the project. She is currently working on a master's in Public Health.

Student B has been actively engaged in the nonprofit community in Chicago. Her role with the Initiative was to serve as a TA to the faculty. She ran considerable interference for the Initiative and was a public speaker with panels on Latino health.

### Student C

Student C is a graduate student in the Division of Community Health Sciences. Student C is particularly interested in child development, child nutrition, and pediatric obesity. The student has studied the characteristics of very young Latino children referred for obesity management. She has been actively engaged with the nonprofit community in Chicago.

## The Ethnographies: Joshua, Christopher, and Christian* (The Former Students Are Permitting Their First Names to Be Used)

The HPN Program at UIC cast a wide net in their recruitment activities. They advertised via social networking sites, emailed colleagues at other

universities, contacted HBCUs (historically black colleges and universities), word of mouth, and other ways. Over the course of three years, each program appeared to have more success recruiting young women than young men. The third year of the program was particularly dramatic in the gender differential.

The evaluator utilized the social science research technique of ethnography that allows one to understand what is happening in a setting that may hold a way to interpret data for future import. During the three years the evaluator made observations and interviewed participants, it was noteworthy that more females enrolled in each of the programs or was overrepresented in research gatherings. The evaluator took the unusual steps to isolate what drove young men to adopt healthcare as an option. The following three young men appeared to represent the aspirations of the respective programs and groupings.

### Joshua's Story

Joshua was born in Chicago and is a graduate of The University of Chicago Laboratory School, Morehouse College, and the University of Illinois at Chicago Medical School. He played sports in high school and at Morehouse. His sport of choice was baseball. Joshua majored in Spanish at Morehouse and was unsure what he wanted his future career to be when he realized that sports medicine or orthopedic surgery was in his future. After Morehouse, he returned to Chicago and taught Spanish at a charter school.

When he recognized that medicine was in his future, he applied to the University of Illinois at Chicago and was rejected. However, during the interview process for the College of Medicine he learned about the Post-baccalaureate Program at UIC that, if completed successfully, would lead him to admission to UIC-Medical School. He enrolled in the PBP and successfully completed the 11-month intensive science and math program and enrolled at UIC-Medical School. He successfully completed medical school and was accepted into one of the most prestigious orthopedic residencies in the country, the Hospital for Special Surgery in New York.

### Christopher's Story

Christopher is a product of Chicago Public Schools. He attended the University of Illinois at Urbana-Champaign where he was a varsity basketball player. His time with the Fighting Illini taught him the value of teamwork and collaboration. He also indicated he had to keep up with his studies by taking his coursework on planes and buses when he traveled to competing colleges. He majored in Kinesiology and knew he wanted to go into Sports Medicine.

Christopher was wait-listed when he applied to UIC-Medical School. He attended the Post-baccalaureate Program and successfully completed it. He did his Residency at Rush University Medical Center and has recently accepted a position in North Carolina. While at North Carolina, he interviewed for the Sports Director at the University of Chicago. He began this position in 2019.

### Christian's Story

Christian attended a charter school in the Little Village area of Chicago. He was unsure of his long-term career interest when he was encouraged to do an internship at Northwestern University Medical Center with a Neonatologist. Due to his high GPA, he was awarded a scholarship to MacCormac College, a small college that prepares students to work in criminal justice, court reporting, paralegal affairs, and general business.

When Christian introduced himself to his classmates, he mentioned that he wanted to be a Neonatologist. The evaluator recommended he apply to the RTCP Program at UIC to explore his interest in medicine. Christian performed well in the program and was exposed to other students with a like interest in medicine, dentistry, and public health. He is currently in the process of pursuing a transfer to the University of Illinois at Urbana-Champaign and will complete his junior and senior year at UIUC if admitted.

Each student that participated in the ethnological exercise had a commonality that rings true for most successful students throughout their academic careers:

- Family and community support.
- They came from a strong high school curriculum dynamic.
- Each did some type of pre-college, pre-medical school engagement with the healthcare community.
- They each had a good information pipeline or a networking pipeline.
- They each had a personality type that lends itself to listening and taking the recommendations of senior advisors.
- They each participated in team sports (baseball, basketball, and soccer), so they understood the importance and value of team collaboration and effort.
- They were into "friendly" competition, not the cut-throat variety, but the type that encourages collaboration.
- They also appreciated the mentors that had helped them along the way; they had good "home-training," where people wanted to help them.
- They each had a plan, how they would get to that next step.
- They were each willing to enroll in either post-baccalaureate or post-academic year training to advance their matriculation to medical school.
- Healthcare careers.
- They all evidenced a high degree of social skills in terms of behavior, dress, attitude, interaction with peers and seniors; and they were adaptive to new environments.

The young men who participated as key informants are summarized below. The evaluator took the liberty of summarizing their similarities. A key element was the three informants were also from small families (two siblings or less) and had a push from their parents. They each conveyed the outsized role their parents went through to get them into high-performing elementary schools and high schools; extracurricular activities; and to insure their sons were safe by going through extraordinary means to live in a safe area or to make certain they had some form of car service to keep them from being exposed to circumstances that may be out of their control. While this does not guarantee safety, it certainly made them less susceptible to untoward circumstances.

## Conclusion

The goal to recruit and retain students to strengthen diversity within the healthcare arena was realized during the 3-year Initiatives. The students took advantage of the online curricula and were provided with financial support during their engagement. The successful collaboration between Dentistry, Medicine, Public Health, and ancillary health program will be a driver for a more productive association in the future.

All the students reported they were introduced to networks of public health professionals that will be invaluable to their professional careers and continued growth. The participants in both programs showed stamina and fortitude in completing the programs even though they ran into financial, transportation, health, childcare, and other setbacks during the programs.

The attributes the students exemplified were resilience, agility, optimism, persistence, and resourcefulness. The support of their families has also been a critical element in their successful program completion. These young scholars were a special group and their continued success is guaranteed by their tenacity, determination, and desire to do good.

The faculty each displayed considerable care in developing the curriculum. All participants agreed that providing information and recruitment opportunities to underserved, rural, and lower socioeconomic students will make for a more robust healthcare system and healthier communities.

Learning in the Age of a Pandemic.

Students are attending classes, networking, and developing careers during a pandemic. The authors recognize that students have to double their efforts to complete their coursework, maintain a positive mental attitude that presents well over the Internet and through various communication vehicles, and maintain contact with family, colleagues, and friends who may prove beneficial for networking purposes. Academic institutions,

employers, public sector, private sector, municipal, state, and federal governments, and the international community will have to enhance the way they communicate with stakeholders. The continued reshaping of the way individuals, governments, employers, and various sectors communicate is rapidly changing and the way we learn, work, and play is transitioning. All communities and sectors are learning and adapting to this new environment.

The Internet has become a necessity and corporations that supply this capacity for communication will have to strengthen their efforts to ensure the continued connection during the academic process in order for students to matriculate to the world of work. These are stressful times for every stakeholder who relies on the educational arena to produce the workforce for the new normal. Active participation with technology and renewed support from technology companies will hopefully generate the symbiosis society needs to overcome any shortcomings from the online/remote environments.

## Synonyms

Global integrity; Global values; International anti-corruption

## Introduction

Ethics and integrity are now widely recognized to be crucial for the development and maintenance of a well-functioning and stable public administration and moreover are seen as being a necessary component for achieving a well-functioning public policy. The effects of corruption, by contrast, are seen to present a central challenge to the functioning of the state. However, while almost all would agree at the abstract level that corruption is bad and integrity is good, it is conceptually difficult to understand what behavior ought to be thought of as "corrupt" and what behavior or attitudes ought to represent "ethics." This is partly a question of definitions; corruption has dozens of definitions that would all label different bundles of actions as corrupt or not. Yet, moreover, this difficulty is also a question of culture and the relativity of ethics. Simply, some cultures view certain actions as ethically permissible while others do not. This in turn raises important questions about what is the "right" balance between ethical universalism and ethical relativism. It is against this backdrop that the challenge of creating a global standard of ethics has to be understood.

Global ethics is a standard of administrative ethics that could be applied across the world and to which all states and administrations, or at least the vast majority thereof, can subscribe. This problem can be approached in two ways: (1) We can define an ethical standard that is, in some sense, "universal." Since this standard has a universal relevance, it can be freely adopted globally. (2) We can define a system of ethical behavior that is acceptable to some group of (powerful) people and, through incentives or force, implement them on a global scale. In neither case we are necessarily required to create a complete ethical system; global ethics can be "minimal" in the sense that they can represent a few core tenants rather than an entire ethical belief system. However, even attempts to specify the specific components of such "core" ethics have proved extremely difficult even among academics (see Lawton et al. 2015: 332–334), and agreement among policy makers (or the general public) seems to be a far-off dream.

This chapter discusses both the theory and practice of ethical regulation in a global context. It considers the implications of different (and culturally bound) conceptual understandings of what

G

ethics are and the challenges that differences of opinion here pose for our attempts to create a consensual global ethics. It also discusses how global ethics have been approached in practice, noting that real-world applications have frequently made significant use of coercion of one kind or another. This chapter begins by discussing the theoretical foundations of ethics and the challenges posed by ethical relativism for creating a "global ethics." It then discusses real-world attempts to introduce global ethics. Ultimately, it concludes that global ethics will inherently remain problematic in its application so long as its application relies on unequal power distributions to force one culture's understanding of ethics upon the world.

## Local Values and Global Ethics

At the broadest level, there is agreement about the nature of ethics. Ethics are the rules or principles that claim the authority to guide how we ought to act and how we ought to live (Singer 1994: 3–4). Ethics involve judgments about what is "right" and what is "wrong": ethical actions are those that are "right," while unethical actions are those that are "wrong." Unfortunately, despite somewhat broad agreement as to the nature of ethics, the specific delineation of what actions are to be considered ethical has been the subject of enormous contention, and moreover the means by which we ought to choose which actions are ethical, or not, is also a contentious subject. Are ethical actions those that support the greatest happiness to the greatest number (as per utilitarianism)? Or are they those that arise from the inherent ethical virtues of the person acting (as per virtue ethics)? Are they those actions that promote some conception of justice (as per Rawls 1971)? Or moreover are ethical actions those that we consider ethical using our own personal conception of what ethical actions are, informed by our own specific culture and values (as per relativism)? These are conceptually difficult questions, for which we are unlikely to ever reach a definitive conclusion.

While relativism is not be the primary means through which the ethical content of actions has been understood either in theory or in practice, the challenge posed by relativism is particularly great from the perspective of creating global ethics. Indeed, if we accept the relativist perspective, it becomes somewhat meaningless to talk of a "global ethics" at all, because the question immediately becomes one of "whose ethics?" If ethical standards cannot be agreed by reference to some shared standard of probity, then we run the risk of ethics being a situation in which "might makes right," where "global" ethics are defined almost exclusively by a dominant political culture and the rest of the world are coerced to obey. While this may (or may not) be successful in implementing a global framework, it appears to be far from ideal normatively and moreover runs the risk of principled noncompliance.

The philosophic case for relativism has rarely been made more forcefully than by the respected philosopher Mackie (1977: 15) who began his important work on the subject with the bold statement that "There are no objective values." Philosophically, this means that there is no objective standard of moral rightness or moral wrongness, and instead all judgments about rightness and wrongness are inherently based upon cultural and personal norms. As a necessary consequence, there can be no objective standard of "ethics." While there are of course instrumental arguments in favor of certain approaches – perhaps, for example, because they have previously been associated with "better" outcomes – this is not sufficient for establishing a global ethics. Indeed, at least on the relativist argument, there also can be no universal agreement about the ends of public life, and thus there can be no universal agreement about what we should be maximizing. Western conceptions, heavily influenced by theorists like Max Weber, often seek an impartial and professional bureaucracy that can impartially implement some conception of societal good (see also Rothstein 2011). However, this is a view that is not always shared in non-Western contexts. Indeed, in many contexts the establishment of close relationships is seen as the key to successful implementation of policies. Not only does this create a tension between different conceptualizations of "good" public services, but under certain

circumstances it can also lead to problems delineating when a system is corrupt and when it is operating ethically (cf. Dunfee and Warren 2001).

This discussion is not about which system leads to more efficient outputs, but instead is about the moral "rightness" of various systems. Fundamentally, the discussion is a question of values, and which values are morally better. If Mackie's claims about the absence of objective values are correct, there can never be a satisfactory answer to this question. As such, discussions are immediately refocused in terms of adherence to the moral tastes of the powerful or instead are reconceptualized as a push for some form of efficiency. While a push for greater efficiency at the global level may be an ultimately useful goal, it is hard to see this as an adequate response to the problem of global ethics.

Some have objected to such a line on the rationale that, irrespective of divergent moral codes, "the abstract virtue of justice. . . and, in some form and in some degree, the virtue of honesty" are (more or less) universal features of moral systems (Strawson 1961: 12). If this were the case, it might be supposed that we can still build a global ethics around the idea of procedural justice, irrespective of what the individual features of the procedures are. Under such a system, what is ethical is merely that which follows the stated procedures and that which is unethical is that which does not (in a manner similar to the impartiality criterion proposed by Rothstein 2011: 12–17). Nonetheless, this response still struggles with situations in which the formal procedures are demonstrably unjust, and our moral intuition is that it is unethical to follow them, such as is the case in apartheid systems. Moreover, any claim to even minimal universal ethics still relies upon an ultimately subjective claim about values. Because such a claim is subjective, it remains entirely possible that some groups will reject the very notion of such a claim to "global" ethics.

## The Practical World of Global Ethics

So far it has been noted that if all values are ultimately subjective – and there is no compelling reason to think they are not – then there is no universal moral case for global ethics, however defined. Moreover, we also cannot know what ought to form the content of a truly global ethics, because views about the specific content of a global ethics are defined individually or perhaps by reference to a specific culture. To the extent that both of these factors are necessary for a workable global ethics, global ethics are impossible. Nonetheless, as has been alluded to, it remains possible to establish a global ethical system by fiat. Under such a system, some authority takes the lead in establishing a global ethical system that is then either imposed globally or is constructed as part of a package that makes acceptance essentially inevitable in the long run.

While establishing a system of global ethics by fiat risks defining ethics in terms of the personal values of the globally powerful, it does provide a practical way forward that could lead to a globally workable solution. This is similar to the process that has taken place with human rights, which eventually led to the Universal Declaration of Human Rights (for a discussion, see Habermas 2010). Indeed, Habermas (2010: 470) argues that "human rights circumscribe precisely that part (and only that part) of morality which can be translated into the medium of coercive law and become political reality in the robust shape of effective civil rights." In this sense, human rights are the art of the possible. In exactly the same way, we might seek a global ethics that delineates only that part of a broader ethical morality that we can realistically implement through legislative codes. This pushes us toward a minimal global ethics but perhaps one that can actually be implemented. While, of course, this has the potential to merely reflect the interests of a few powerful individuals or institutions, the focus on what is possible also builds in some notion of responsiveness to different cultural understandings, even if only because it is very difficult to override cultural traditions.

Attempts to create a global ethical system by fiat have taken different forms. Some approaches have been strictly legal or regulatory, attempting to build up a global ethical framework either through transnational agreements or national laws that can be applied more broadly. Other

approaches have focused on persuasion, in which groups such as NGOs have sought to use their persuasive power to push countries toward implementing the NGOs' own interpretation of global ethics. Both of these approaches have been far more successful than hopes that ethical systems would independently converge on some formulation of global ethics as a result of some underlying "innate" conceptualization of ethics and integrity.

## Global Ethics by Force: Legal and Regulatory Responses

While individual countries do not normally have the power to impose their conceptualizations of ethics upon other countries, certain countries have been particularly successful in spreading their own view of global ethics. The *US Foreign Corrupt Practices Act of 1977* (FCPA) has been particularly important in this regard. Originally introduced in response to a series of important revelations about high-profile cases of bribery, the FCPA explicitly aimed to criminalize bribing foreign (i.e., non-US) public officials. While such legislation only directly criminalizes those people subject to US law, which in practice means most US citizens and companies with important business interests in the USA, the legislation has the significant secondary effect of imposing an anti-bribery ethic more widely (Spahn 2013: 10). Indeed, the FCPA has an important role to play in reducing the global supply of bribes, a fact that is particularly important in light of the significance of US-based businesses for the global economy and international trade. While it is possible that this supply-side approach to global ethics will also lead to a reduction in demand for bribes, failure to do so does not challenge the importance of the FCPA from a global ethics standpoint. Even if foreign public officials still desire bribes, and so fundamentally lack ethics, the fact that they are cut off from an important source of potential bribes is significant. Moreover, by focusing on the supply side of bribery, the FCPA is able to work within a single culture, thereby bypassing some (but not all) of the philosophical objections to global ethics discussed above. Nonetheless, the FCPA has been criticized and was criticized particularly strongly during its early years before a series of important reforms. Key criticisms included that "the FCPA is too vague in its terminology, that the Act is largely rhetorical and that its criminal sanctions are unenforceable in an international context" (Bader and Shaw 1983: 632). However, regardless of such criticisms, by introducing a strong *expectation* of integrity, the FCPA has been particularly important for the creation of global ethical norms (Spahn 2013).

The most important practical limitation of the FCPA is that it only affects US citizens and US companies. Addressing this, the OECD incorporated similar responsibilities as part of the *Convention on Combating Bribery of Foreign Public Officials in International Business Transactions*, 1997 (see OECD 2011). This convention set the expectation that OECD countries would implement rules similar to the FCPA in their own legal systems, and thus signing the convention represents a commitment to tackling paying bribes to foreign officials. The *Convention* has a similar focus upon the act of bribing a foreign public official itself rather than on receiving a bribe, again reinforcing the supply-side approach. Crucially, however, by 2016 41 countries have signed the OECD Convention, including Russia and Brazil (OECD 2016). This seriously expands the range of such global ethical principles. While implementation of these policies within each country's individual legislative framework is in practice a slow process, it appears that there is at least a broad-based desire to prevent the bribery of foreign public officials. Moreover, the countries that have signed up to the *Convention*, including the USA, Germany, Japan, France, and the UK, represent a significant proportion of the global export economy. By implementing a commitment that citizens of these countries will not engage in bribery of foreign public officials, it theoretically becomes much harder for foreign public officials to take bribes.

Unfortunately, implementing a system of global ethics by fiat does not inherently mean that those operating within the global ethical

system will internalize those ethical values; enforcement thus becomes a key challenge. While enforcement has been less than ideal in many countries, some have tried bold new ways to force individuals and companies operating within their territories to adhere to the predefined system of global ethics. One notable example is the UK's approach in the *Bribery Act* (2010). Like much other regulation in this area, the *Bribery Act* explicitly criminalizes bribing foreign public officials, but it also criminalizes paying bribes more generally as well as receiving bribes. However, what is particularly important from a global ethics standpoint is that the *Bribery Act* also criminalizes the failure by commercial organizations to take reasonable steps to prevent bribery (Bribery Act 2010: §7). This duty applies to both companies registered in the UK regardless of where they are doing business as well as all companies operating within the UK regardless of where they are registered. Thus, the coercive power of UK law is able to extend beyond the territorial boundaries of the UK. This expands the scope of potential enforcement significantly and increases the saliency of the ethical requirements in the global context, particularly because of the importance of the UK as an international business center.

## Global Ethics by Persuasion

Despite the successes of the "force" approach to global ethics, it still remains an imposition that fits uneasily with the idea that we might be able to foster a consensual global ethical system. Moreover, there will always remain a fear that such an imposition will not lead to a reduction in unethical behavior but instead simply to a relocation of unethical behavior into presently unregulated areas. Particularly because the approach taken by the FCPA, and OECD more generally, only explicitly targets the bribe payer, it is not apparent that such approaches increase the desire of bribe takers to be ethical at all. Persuasion-based approaches may offer a way to address this gap. If individual countries themselves can come to see the value of ethics internally and can have a strong desire to implement and enforce ethical codes, then we may be able to address the desire of public officials to accept bribes from international actors. While governments may also seek to encourage greater ethical behavior within other countries, NGOs and third sector bodies have been particularly important in this campaign for greater ethics and integrity internationally. The importance of NGOs in this context is both a reflection of their propensity to focus on a single issue and also their ability to have an explicitly transnational focus in their work. From the point of view of global ethics, it also matters that NGOs are usually coherent institutions that are working to a common understanding both of what ethics are and how ethical goals ought to be achieved. That does not mean that they seek to persuade governments to implement identical policies in every country regardless of context but instead that they seek to persuade governments to implement at least a minimal standard of global ethics that is contextually appropriate.

Transparency International (TI) is probably the most important NGO seeking to foster global ethics. Since their founding in the early 1990s, they have gone on to publish hundreds of reports pushing for greater ethics and accountability both within specific countries and in international organizations. While TI, of course, does not have primary legislative functions, they have been very successful in persuading legislatures to propose laws promoting integrity. Yet what TI is perhaps now best known for is their Corruption Perceptions Index, their annual measure of the extent to which corruption is perceived to be a problem in the countries of the world. By turning the extent of global corruption and thus the absence of global ethics into an important yearly talking point, and moreover seemingly creating a desire to be seen to be doing better in the yearly rankings, TI has been able to use a significant degree of "soft power" to promote global ethics. Moreover, because the index officially relies on a single understanding of what corruption is and because it is applied to the whole world simultaneously, the measure has been an important force in globalizing our approach to corruption and integrity. While the Corruption Perceptions Index itself has been strongly criticized as a measure of corruption (for a recent review, see

Heywood and Rose 2014), it cannot be denied that it has been enormously important for the development of a global concern about corruption and integrity. While other groups have produced similar indices – notably including the World Bank's Control of Corruption Index – few groups have been able to achieve the level of prominence or impact of TI.

The European Commission has also been important in promoting Europe-wide standards of ethics. While the European Commission has much more power than bodies like TI or the World Bank, they have pursued an approach to global ethics that is based largely upon persuasion and information sharing. The European Commission's *Anti-Corruption Report* (2014), for example, discussed the problem of ethics in a European-wide context and went on to give recommendations for promoting ethics and integrity within each member state of the EU. The implementation (or not) of such recommendations is a matter for national governments, but what matters more than the policy success or failure is that the project as a whole taps into the idea of a core shared understanding of administrative ethics. This shared understanding may or may not have already existed at some minimal level, but it is important to note that the mere act of cross-cultural working inherently builds toward a deeper sharing of concepts.

These persuasion-based approaches do not inherently require the exercise of power against countries. Indeed, there remains a hope that such approaches can be empowering, because they are restricted to recommending and suggesting; the specifics of implementation are left up to individual countries or cultures. Nevertheless, we must remain cautious about the possibility of suggestions becoming requirements. If access to international aid or development loans becomes conditional upon accepting such "suggestions," our system of global ethics runs the very real danger of becoming unethical.

## Conclusion

This chapter has looked at the problem of global ethics both from a philosophical standpoint and from the "real-world" perspective of global ethics in action. Philosophically, it has been noted that we have very good reasons to be suspicious of the idea that we will ever create a universally acceptable standard of ethics. Indeed, it may be the case that it is impossible to truly create a global ethics that all of humanity can subscribe to without coercion. On the practical level, where coercion of many different forms is the norm, there are many reasons to be optimistic that we can arrive at a situation in which some minimal standard of ethics can be applied globally. Innovations like the OECD's *Convention on Combating Bribery* are in a very real sense creating a global standard of ethics. However, such innovations inherently rely on unequal power distributions – OECD member states can implement these rules and force their application more broadly because they are rich and powerful countries. Built into such reasoning is a lack of agency given to poorer and less powerful countries; what is good for poorer countries is defined almost exclusively in terms of the attitudes and desires of the global elite. Of course, poorer countries also want to tackle corruption and will also benefit from a higher ethical standard, but approaches that ignore local cultures and customs are likely to be less effective than those that work with them. Ultimately, the challenge for policy makers will be devising policies that can realistically be applied globally but that do no alienate those with different cultural understandings of what is ethical. Persuasion-based approaches may offer hope here, because they can give some control back to individual countries and cultures and empower them to design their own ethical frameworks within a global standard. Nonetheless, defining what the minimal global standard is, or ought to be, again raises conceptually difficult questions about the fundamental nature of ethics.

## Synonyms

Banking administration; Collapse; Crisis; Derivatives; Finance; Globalization; Instability

## Definition

A crisis is a turning point in a sequence of events, or a time of instability or danger in which impending change is signaled. As it pertains to financial systems, a crisis is defined as loss of control or an unstable period in financial markets that normal control mechanisms cannot manage well.

## Introduction

The system by which the world exchanges goods and services through financial institutions is global and called the international monetary system (IMS). Trillions of dollars-worth of exchanges are processed through this system each day. The players that compose this system include private financial institutions, sovereign and supra-sovereign governments and their regulators, multinational corporations, and billions of individuals and small businesses. Many types of banking, investment, and trade operations are in play on any given day, at all hours, weekends included. The banking and financial sector represent massive financial and economic power and in and of themselves represent a large part of the global economy.

Many types of banks and institutions make up the IMS. A few dozen very large, global player

institutions such as HSBC, J.P. Morgan Chase, and Deutsche Bank dominate the banking sector. These large banks are called "systemically important financial institutions" or "SIFIs," and much attention has been focused on them since 2008 because of their role in precipitating the crisis. Most of these combine retail banking with global investing in derivatives and hedge funds. In addition, there are "development" banks, "infrastructure" banks, and "investment" banks and holding companies whose purpose is to buy and sell commodities and currencies. There are five major such banks: the Asian Development Bank, the Chinese Infrastructure Bank, the European Bank for Infrastructure and Development, the Inter-American Development Bank, and, of course, the World Bank.

A "central bank" is usually partnered with a national agency and the two are in charge of overseeing the banks in their jurisdictions, of managing monetary policy for the sovereign government, for raising or lowering the interest rate at which banks borrow from the central banks, and for maintaining the rate at which individuals and businesses obtain loans. Theirs is a multiple role. There is the European Central Bank (ECB), the People's Bank of China (PBOC), the Bank of Japan (BOJ), the Bank of England (BOE), and of course the US Federal Reserve (The Fed) which is not "federal" in the sense of being a government agency but a cartel of private member banks that have agreed to serve as the financial manager and holder of US government accounts.

At the national level, banking operations are controlled (this term is used loosely) by the Fed and government regulators who have power to regulate almost every banking process such as the amount of funds banks must keep in reserve, the kinds of disclosure banks must make, rules on compensation, and they even suggest interest rates for loans the bank may make. The Federal Deposit Insurance Corporation (FDIC) ensures the safety of depositor's money by imposing strict rules on banks. Another example of regulatory power is the Federal Reserve's capital requirements, which means that banks must keep on hand a certain percentage of their assets for specific purposes. In the Dodd-Frank Act of 2010 Congress added regulatory power over banks to the Fed's list of job duties. Plus, each of the fifty states also has a bank regulation office, but these vary in the amount of power and control each has over banks in any particular state. As is the case with most central banks, the Fed's goals are to promote monetary stability, manage the money supply, and promote full employment (US Federal Reserve 2015). Other central banks do approximately the same for their sovereign governments that are also important global players in the IMS.

National legislatures pass laws designed to reign in behavior that is deemed risky to banking stability. In the United States, for example, Congress passed the Securities Act of 1933 and the Securities Exchange Act of 1934 in an early attempt to manage the Depression and the Glass Steagall Act (Banking Act of 1933) that was designed to separate retail banking from investing. The latter law was partially repealed in 1999 during the Clinton administration to allow banks to invest in a wide range of securities including derivatives and hedge funds.

The international monetary fund (IMF) was created after WWII, and their initial role was to provide liquidity to nations in need on a short-term basis. Very early in their tenure, the IMF created a new unit of account called Special Drawing Rights (SDRs), a unit of account composed of a basket that includes the big four fiat currencies: the Dollar, the British Pound, the Euro, and the Yen. In 2016, the SDR basket may include the Chinese Yuan. By 1973, the IMF had loaned out about 250 billion SDRs and created "structural adjustment mechanisms" for sovereign emergencies and other purposes. Today, in 2016, the IMF operates 13 such mechanisms that can alleviate financial stress through a series of SDR distributions to member nations in need. The IMF's role has broadened to include financial oversight of national fiscal and monetary policy (Mateos y Lago et al. 2009).

### Definition of a Crisis

The definition of a crisis is a turning point in a sequence of events or a time of instability or danger in which impending change is signaled (Dictionary.com 2016). As it pertains to financial

systems, a crisis is defined as loss of control, a disequilibrium in financial markets that normal control mechanisms cannot manage well. Thus, the near meltdown of brokerage houses and investment banks during the 2008–2009 period qualifies as a crisis because normal control processes were insufficient to restore equilibrium and unconventional policies had to be implemented (da Silva 2016).

### The 2008–2009 Crisis

Over-extended mortgage borrowing in the USA and risky derivative trading worldwide, in part on those same mortgage portfolios, occurred during the years preceding the crisis. From 2004 through 2008 home loans defaulted, and bank portfolios of home loans became "toxic." Excessive loan defaults brought declining profits, and some banks became technically insolvent. To stem the cascade of financial panic that ensued in the USA, the government made quick decisions to prevent corporate bankruptcies, massive layoffs, and decline in the gross domestic product. Banks and corporate giants have been deemed "too big to fail" because their failure would have brought gross disruption of life including social unrest. The Bush administration authorized the Fed to create trillions of dollars of additional currency that was used to prop up companies likes like General Motors, American International Group Insurance (AIG), and banks like J.P. Morgan Chase and Citigroup. The program was called the Troubled Asset Relief Program or TARP, and trillions of dollars of liquidity, courtesy of the US taxpayers who would one day have to repay the debt, was pumped into the financial system.

Many European banks had invested in these same loan portfolios and the same derivatives with the result that these banks also verged on insolvency. Their sovereign governments came to their rescue much the same as the US government had done. Additionally, some European nations had become accustomed to borrowing to close their deficits on a yearly basis: deficits that resulted primarily from growing social service demands. Very soon, investors, regulators, and sovereign agents themselves were so heavily involved in rescues and borrowing to meet deficits that they themselves were at risk of default. A banking crisis had become a sovereign crisis, and global financial default looked imminent. At this point, the European Parliament passed legislation similar to that of Congress in 2010 for member EU countries to halt the broad decline in national economies and to stem the bank panics. As Spain, Portugal, Ireland, and Greece teetered toward insolvency in 2012 through 2014, the EU committed 1.6 trillion Euros to national banks and sovereign governments to keep them afloat (European Union Commission 2012).

As one can imagine, these crises brought reflection, recrimination, and revelation on what must be done to prevent same from happening again. Congress legislated new agencies and powers for them and The Fed in the Dodd-Frank Act of 2010. The EU member nations were forced by the EU and IMF to reform their profligate spending in order that they might receive a bailout.

## IMS Problems, Symptoms of Problems, and Complicating Factors Problems

### Debt, Deficits, and Declining Growth

In the normal course of affairs, economies wax and wane. GDP growth, markets, unemployment, profits, and demands for government services come and go. When wages stagnate, loans default and banks suffer. Recessions can appear very quickly in unstable economies. More often than not countries overspend the revenues they earn leaving them forced to either reform their expenditures or restructure their revenues, neither very politically popular especially during election years. By 2016, the ratio of many nation's debt to its GDP were over 100% and two (Greece and Japan) were over 200% (IMF 2012). Debt ratios in South American nations are coupled with political intrigue, corruption, high unemployment, and inflation, and defaults loom as they struggle to remain solvent (IMF 2015) (Fig. 1).

As of 2016, an oil glut and a decline in consumer demand represent global growth that has stalled. China's growth rate has been cut in half, and the Baltic Dry Shipping Index, a global benchmark of the magnitude of trade, stood at

**Global Financial Crisis Management, Fig. 1** Percent debt to GDP ratios. 2000–2014. (Source: Data Extracted from OECD: Governmental Debt to GDP Ratios. 2014)

650 in 2016 from 1222 in early 2015 (Bloomberg Business 2015). The Conference Board reported that US growth, once forecast for 2016 at 3–4%, is now likely to be around 2% for 2016 (2016). EU and Chinese economies have slowed necessitating central banks to take extreme measures of handing out checks in Japan to imposing negative interest rates in several EU nations' banks.

## Banking and Investing

Despite all the efforts to the contrary, banks are still too big to fail, and their volume of derivatives trading has not abated since the crisis. Interconnected banks who may be partners in a derivatives trade can take each other down when one bank fails. The domino effect can take the whole system down as so many institutions are partners on various kinds of trades. Opaque accounting by hundreds of global businesses, financial institutions, and some superpowers prevents accurate risk assessment.

The Dodd-Frank Act of 2010 created several administrative entities designed to oversee financial institutions and make recommendations. The primary office is the Financial Stability Oversight Board that assesses risks in the banking system and makes recommendation to the biggest banks. The law required systemically important financial institutions (SIFIs) to increase the capital reserves on hand and provide a plan for the orderly wind-down of their bank should something happen and the bank was forced to declare bankruptcy. These plans were called "Living Wills" and were due to the FDIC and the Fed by 2014. Unfortunately, of the 11 banks who turned in plans, most found their plan rejected by the FDIC but not the Fed and the ensuing disagreement between the regulators resulted in providing the wayward banks 2 more years to have another go at it. In 2016, five of these newly submitted Living Wills for orderly bank resolution were again rejected. At least four of these banks were now two-time losers. Thus, as of 2016, 8 years have passed since the crisis, the banks are still very large in the USA, and they have no credible plan for resolution if a crisis erupts. The added problem is the lack of regulatory success in and of itself.

Europe claims to have done much better with its regulatory structure. The EU's problem is a little more complicated because theirs includes potential sovereign insolvency not just banking insolvency. Among the more important programs is the European stability mechanism capitalized at 500 billion Euros. The European Commission

claims that the sovereign and banking crises are resolved, market confidence is up, and stability has returned to the overall region (European Commission 2014). However, deficits, debts, low growth, and geopolitical issues threaten to disrupt this stability and, in 2016, an Austrian bank was bailed-in by its shareholders and depositors to keep it afloat. Apparently all is not well just yet.

### Cybercrime

Sales of goods and services, investing, and banking are now electronic, passed through the Society for Worldwide Interbank Financial Transactions (SWIFT) in seconds in various currencies. The error rate is very low. The system is usually very stable. However, cybercrime is an ever-present reality and data breaches at some of the world's largest institutions have caused massive disruptions. Although the financial networks are very secure, mega-threats remain. Governments and private sector companies are rushing full-speed ahead on ways to combat cybercrime and cyber terrorism. A related issue is the high-speed automatic trading, one episode of which may have caused the 2010 "flash crash" in US markets where 1,000 points dropped out of the Dow Jones Index in minutes. Regulators at the Securities and Exchange Commission (SEC) and the Commodity Futures Trading Commission (CFTC) have not proven the cause and, although high speed-computer automated trading was banned by these regulators, there are ways to obviate these regulations.

## Symptoms of Problems

In the global financial system, a symptom evidences a potential problem when abnormal events and processes are seen. When that which is normal does not occur and the atypical becomes an everyday occurrence, problems lie in wait.

### Schemes, Scams, Fuzzy Math, and Fraud

Fifty billion dollars was lost in the Bernie Madoff Ponzi scheme, a record for fraud in the USA. Former governor of New Jersey, Jon Corzine, lost millions of dollars of client money in the MF Global scandal. There was the London Interbank Offer Rate (LIBOR) mess and the "London Whale" affair that shook the markets and eroded confidence. A Panamanian law firm, Mossack Fonseca, has opened up the shadowy world of offshore shell companies set up by various government leaders and celebrities who hoped to avoid paying taxes in their own country. Add to this manipulated data regarding the cost of living in the USA where food and energy costs are removed from the estimated cost of a basket of daily goods, hidden government debt, and unemployment numbers that do not add up. The public is presented with an erroneous view of the economy. For example, the "debt" reported by the US Treasury generally only counts the "on-budget" debt but ignores debt in other funds, like the Social Security Trust fund. Labor Department statistics on weekly first-time jobless numbers are usually around 200,000 or so yet, mysteriously, the unemployment rate is said to be lower.

If 200,000 people are newly unemployed weekly, then approximately 800,000+ are newly unemployed each month; therefore, more than 800,000 jobs would have to have been created each month in order for the net unemployment numbers to drop. Either the jobless numbers are wrong, the jobs created figure is wrong, or somebody in the US Labor Department cannot calculate correctly. Either way the public is misinformed. Consider also that the accounting system in use by the US government is on the cash basis instead of the accrual basis which makes the financial picture look rosier than it is because future liabilities like social security are not counted (U.S. Treasury 2015a).

Newspapers and financial forums detail bank scandals and threats of prosecutions that never seem to go to trial but usually result in payment of massive fines. Bank America, Deutsche Bank, Credit Agricole, Credit Suisse, Barclays, and J.P. Morgan have paid billions of dollars to US regulators for fraud or other inappropriate behavior. The largest fine against a bank was the 2015 8.9 billion dollar fine levied on BNP Paribas, a French bank for their role in facilitating trade with Iran in violation of US sanctions. These fines

represent a specific fraud problem in the banking sector.

### Quantitative Easing (QE), ZIRP, and NIRP

Quantitative easing (QE) occurs when nations continue to print extra currency months or years on end for the purpose of either closing a budget gap or to stimulate spending. QE is both a symptom of a problem and a tool to remove the problem. It is a symptom because printing extra currency signals declining government finances or economy or both. Sometimes the tactic works to bring the declining economy back to life so it serves as a tool as well, but printing currency beyond the limits of a well-thought-out strategy devalues the currency in circulation which is inflationary. In addition, because consumer and business spending is weak, central banks around the world have lowered the rate at which they lend money to member banks in their system to zero percent or near zero, but this process can promote risky behavior because the borrowed money is too easy to get and cheap to repay at zero interest. Money can be borrowed and invested in derivatives, possibly for double-digit returns, while the public borrows at a rate based off of the prime rate which is usually 3–5%.

The US Fed has vacillated on whether and when to raise the rates but declining market data has forestalled their decision. The EU Central bank has set interest rates on EU accounts in the negative meaning that those who save money in many of the banks in the European Union will not earn interest on their account and instead lose a small percentage to keep their money in the bank (European Central Bank 2016). Japan has also instituted negative rates and Germany's sovereign bond interest rate is negative. Such bonds and accounts become merely a parking place for money not invested elsewhere but the idea is to incent spending and to discourage saving.

### Bail-Ins

After the 2008 crisis, nations that were affected badly crafted legislation to change the bank resolution procedure (bankruptcy). Whereas, in the USA, the FDIC would normally bail out the bank with public money, the Congress, the EU Commission, the Fed, FDIC, and the ECB wrote new policy to conduct "bail-ins" should a bank decline to the point of insolvency. In a bail-in no public money is used to bail-out a failing bank and, instead, bank stock shareholders, bondholders, and even depositors' funds would be written down (taken) to cover the bank's losses and restore it to solvency (EU Commission 2012; FDIC and Bank of England 2012). Bail-ins occurred in 2013 in Cypriot and Greek banks, and in 2016 a bank in Austria was bailed-in. These episodes signal that all is not well in the banking sector.

### Gold Manipulation and Alternative Currencies

Mistrust in the system is also shown by the sales of physical gold and silver, the repatriation of sovereign gold from the US Federal Reserve warehouse, and in the gross manipulation of the precious metals market. Many European nations are repatriating their gold held in foreign vaults including gold held in US vaults either at the Federal Reserve or in a private warehouse. Either they see a need for the metal in the not-so-distant future or they do not trust the vault that holds it. In addition Deutsche Bank, the largest private German bank admitted in 2016 that it indeed has manipulated the gold market for years and offered to give up the names of its coconspirators thus fueling the fire of mistrust in metals. Naked shorting of gold and gold leases is rampant in which a buyer (usually an investment bank) pays a fee to lease gold, sells the lease at a higher price, and buys it back later at a lower price. Many believe this manipulation has kept the price of gold lower than it would otherwise be. While a few scholars have suggested a return to a gold standard, for gold to be used as support for the money in supply now, it would have to be valued at several thousand dollars an ounce. Such inflation, while possible, is not likely because it limits government's ability to print currency and reduces the power of the central banks. China may be revisiting that old gold standard however as in April they set up the new Shanghai gold exchange that will draw business away from other exchanges and has announced they will peg the yuan to gold rather than dollars in a move that may

threaten upheaval in an already frayed monetary system.

### Alternative Currencies

Bitcoin, that algorithm-based crypto-currency much hyped around the world now enjoys the competition of many other electronic units of account. One is the "euthereum," based on a new software concept like Bitcoin, but also different in how it works. While the method of operation is outside the scope of this entry, it is important to note that creation of this electronic unit may be a sign that the currency system is insufficient to supply the world with needed units of account. In addition, many communities have created their own scrip or time-bank currency network to augment failing economies. The fact that governments have either dipped into private and or public pensions to close budget gaps or are investing pension money automatically in sovereign bonds is symptomatic of problems (US Treasury 2015b; Goldfarb 2011; Cauchon 2006).

### Growing Regulatory Authority

Over the last 40 years, governments have created large, complex regulatory structures to reign in wayward behavior or to solve problems in the international monetary system. Since the Bretton Woods conference in 1944, the IMF has gradually evolved from its supportive monetary role to one of direct oversight, policy making, and emergency lending power. With 13 different funding mechanisms linked to policy dictates, theirs is now a "carrot-and-stick" approach. If the IMS was doing well there would be no need for the oversight the IMF now conducts. Prior to the crisis, the USA and Europe, and China rather loosely, regulated their stock markets and financial sectors. Federal agencies kept the system in line. Postcrisis the US Treasury, EU national bank regulators, and, finally, the EU Commission and Parliament expanded their role by creating new agencies and adding power to the FDIC, the Federal Reserve, and the FBI with the passage of the USA PATRIOT Act and the creation of the Financial Crimes Enforcement Network (FINCEN). Plus, in April of 2016, the US Fed has held extra meetings outside of their regular schedule leading many to question why. It is a sign of the times that the regulatory network has grown in proportional complexity to the institutions it attempts to control and that the additional layers of bureaucracy have only weakly managed to corral the vagaries of the global financial system.

## Complicating Factors

A complicating factor is an issue or problem that is not overtly financial but one that has the power to intervene and cause disruption in the financial system at any time.

The world has never seen a period in which there was the absence of conflict but, since the Second World War, armed violence has increased. Besides nation-state conflicts that ended in bloodshed, non-state actors – mainly terrorists – pose a disruptive threat through violence or cybercrime. Geopolitics between superpowers has already erupted into a quiet war between national currencies. Regional conflicts disrupt a country's ability to maintain economic growth and the decline impacts financial markets and heightens risk. Geopolitics is a risk-on game. Disasters, whether natural or man-made, can also disrupt markets and economies, increasing financial risk.

Currency fluctuations, balance of payments issues, and exchange rate problems test even the best international relationships and weigh on the financial system. When inexpensive currencies are devalued, that nation's goods and services become cheaper to the detriment of other currencies. A race to the bottom is a lose-lose for all. Tax structures, labor laws, and the national business climates all impact and can complicate the IMS because business goes where the climate is best. Jobs leave high-tax, tight regulatory environments like the USA in favor of friendlier shores. Add to this the complexity of the system and the low financial literacy rate of society in general. Public education, in general, gives only the briefest coverage of economics, personal, or national finance and rarely touches the global system. A sound system of finance among the community of nations requires a vigilant, well-educated public that is lacking now.

## Tools for Crisis Management

To see the forest through the trees one must step back and look at all that happened and all that has been done to keep it from happening again. To maintain solvency of the international monetary system there are numerous tools: new international organizations, added tools to existing organizations, sovereign national regulators with new tools, regional or supranational bodies creating new rules all in a framework of global cooperation. These bodies surveil and assess risks, suggest policy changes, and offer financial assistance to maintain the stability of the international monetary system.

### The Bank of International Settlements (BIS)

The oldest international organization is the Bank for International Settlements (BIS) established in 1930, chartered in Basel, Switzerland, and designed to strengthen regulations, supervision, and practices of banks and, in turn, enhance financial stability. It is the bank of the central banks. To accomplish this mission, the BIS has created a three-tiered system that includes groups, working groups, and task forces. Five main groups are focused on collaboration among the central banks, maintaining dialogue with other supporting organizations, researching monetary issues, serving as agent or trustee on international financial operations, and acting as counterparty between central banks and their transactions. They conduct 3 yearly meetings on markets, payments, and exchange rates in which they survey the global landscape and discuss risks. Over the last several decades, the Basel Committee on Banking, composed of the high level financial elite of the world, have created what is called the Basel Accords, the third and last of which took effect in 2012. These agreements are designed to shore up capital reserves in big banks and add extra capital to the reserves to counter risk (Basel III Accords 2011).

### The International Monetary Fund (IMF)

The second oldest organization is the International Monetary Fund (IMF), established during the 1944 Bretton Woods Conference whose aims are to promote international monetary cooperation, promote global trade and exchange stability, establish a new payment system, and to make financial resources available to nations in need. To do these things the IMF has set up 13 different funding mechanisms varied according to type of assistance. Many loans to countries are tax-free through 2016, and the IMF also provides technical training to governmental officials in several areas including tax policy, administration, monetary exchange policies, banking and financial system supervision and regulation, and, finally, expenditure management. In short, the IMF has greatly expanded its role from generic lender in 1945 to overseer, manager, and multilateral lender in 2016. A review of the organization's staff, publications, and transcripts indicates a management capability that has permeated the financial offices of 188 nations (IMF 2016).

#### G7 and G20

Two supranational bodies, the G7 and the G20 are also influential in enhancing financial stability. The G7 is a gathering of the finance ministers and central bank heads of 7 nations: Canada, France, Germany, Italy, Japan, the United Kingdom, and the USA that formed during the 1970s after the recession and energy crisis. Concern over system risk had increased, leading this body to begin dialogue on ways to enhance cooperation. The G20 is a group of 19 nations and the European Union that meet yearly with their finance ministers and central bank directors. It is a planning and policy recommending body that seeks to strengthen the global economy and promote institutional stability. Together, the G20 represents 85% of the world's gross domestic output. In 2016, the G20 published a white paper regarding the challenges to global and financial stability posed by geopolitical power shifts indicating recognition of potential problems and the need for more effort (Group of Twenty 2016).

### Financial Stability Board

After the 2008 crisis, one of the global bodies that was formed was the Financial Stability Board (FSB). Working in tandem with the IMF and the BIS, the Board's mandate was to conduct "early

warning exercises" to better surveil risks in the monetary system and prescribe measures to forestall any crisis (Financial Stability Board 2010). The FSB conducts drills to look for vulnerabilities. While they accept that crises cannot be predicted, they note the fact that the IMF missed early signs of impending problems in the run up to the 2008 crisis (p. 10); and now, looking back, they see numerous vulnerabilities in the IMS that preceded most of the major financial crises over the last two decades. Most of the vulnerabilities were on the order of an overextension of credit or asset price bubbles as happened during the US mortgage meltdown. The FSB has partnered with the IMF to create models of parts of the system. Studies have been conducted on economic and banking sectors, corporate sector risk, country fiscal risks, and asset bubble surveillance.

Meanwhile the European Commission has created three new bodies to oversee their financial system. The three bodies are the EU Banking Authority (EBA), the EU Securities and Market Authority (ESMA), and the EU Insurance and Occupational Pensions Authority (EIOPA). Policies and regulations drawn up by these bodies are quite similar to those found in the US Dodd-Frank legislation:

- Recovery plans for banks in trouble
- Resolution plans for failing banks
- Early intervention powers conclusion
- "Bridge" banks
- Resolution authority and bail-ins
- New funding mechanisms for resolution

## Conclusion

The 2008–2009 crisis was the most recent but not the first and it will not be the last. As the world turned out of the distress, the light went on in many government and private offices. All realized something must be done. We should have known a crisis was coming. A few voices in the wilderness sounded the alarm but easy money took precedence leaving carnage in its wake. Our collective response as a society has been to regroup, rediscuss, and reformulate yet another new round of regulations, policies, and proposals lashed to the ramparts of recriminations of our collective guilt in allowing this to happen. For all the new agencies, bureaus, and boards, banks are still too big, still too risky, sovereigns are over-indebted and under-funded, and many say asset bubbles have again formed. Financial elites agree that central bank monetary policy has done all it can do to restore global growth and employment, but the agreement on what to do to maintain system stability while increasing growth ends there (da Silva 2016). The debate revolves around whether secular reform, changes in fiscal policy, negative interest rates, or some other concerted action is needed to produce growth because the government cannot be the only player in this game. On these ideas there is no broad agreement.

Whether the new bodies, meetings, and conventions of specialists and their new sophisticated risk assessment exercises adequately surveil the environment before the next crisis hits is an unanswerable question. Through all of the plans and laws and rules now in place, one proposal is absent from the mix: let a big bank fail and let the failure serve as notice to all of what can happen. Except for certain fringe elements, this idea is not discussed as a tool to manage financial crisis. Also throughout the literature there is the sense that global powers believe they can control the IMS in its entirety through the various mechanisms created. There is a feeling of omnipotence, yet, throughout various plans in several places, exculpatory language seems to say, "Gee we're sorry. We didn't see it coming." This mea culpa rings somewhat hollow in that legions of regulations since 2008 have not materially altered systemic risk. This begs the question of why? Why after 8 years and a plethora of effort are we still trying to figure out why things are not better?

# Global Governance

Matthias Hofferberth
Department of Political Science and Geography, University of Texas at San Antonio, San Antonio, TX, USA

## Synonyms

Global order; World politics

## Introduction

Despite (or maybe precisely because of) its apparent vagueness, the concept of *governance* has become one of the most influential intellectual leitmotifs in contemporary political science. Expanded in scale and scope within the field of International Relations (IR), the notion of *global* governance appears to be even less specific, more intricate, and hence even harder to pinpoint. To no surprise then, ever since its introduction in the 1990s, both proponents and opponents have criticized the concept for its inherent ambiguity and loose definition (Finkelstein 1995; Latham 1999; Murphy 2000). More surprising though is the fact that the concept nevertheless triumphed in reorienting the discipline as global governance today serves as a major point of reference for

both scholars and practitioners of world politics (Barnett and Sikkink 2008). As such, global governance carries a world of diverging meanings and normative commitments when being invoked. Against this background, this chapter provides a brief definition of global governance in the remainder of this introduction before sketching both the disciplinary and the real-world contexts against which the concept and the practice of global governance emerged. Based on this twofold account which situates the concept in the field of IR, current debates and future directions for research will be discussed before the chapter concludes that despite its conceptual ambiguity, scholars should hold on to the concept and collectively continue to push toward realizing its full analytical value (Weiss and Wilkinson 2014a).

In the literature, we find an abundance of at first sight seemingly similar definitions of global governance. However, upon closer inspection, these definitions quite often feature slightly different foci and themes. Adapted from the 1995 Report of the Commission on Global Governance, for example, governance is broadly framed as "the sum of the many ways individuals and institutions, public and private, manage their common affairs." More specifically, it is further defined as "a continuing process through which conflicting or diverse interests may be accommodated and co-operative action may be taken" which "includes formal institutions and regimes empowered to enforce compliance, as well as informal arrangements that people and institutions either have agreed to or perceive to be in their interest" (Commission on Global Governance 1995, 2). Karns and Mingst (2010, 4) in particular focus on the global nature of the concept and think of it as "the multi-level collection of governance-related activities, rules, and mechanisms, formal and informal, public and private, existing in the world today." Advancing a functionalist, almost evolutionary logic, Held and McGrew (2002, 9) see in global governance the "evolving system of (formal and informal) political coordination – across multiple levels from the local to the global – among public authorities (states and IGOs) and private agencies seeking to realize common purposes or resolve collective problems." In this vein, global governance synonymously describes the process of international organization as well as single organizations within this process. Finally, Weiss and Wilkinson (2014b, 9), emphasizing the analytical dimension of global governance, think of it as a concept which helps scholars to "capture more fully the totality of ways in which life on the planet is ordered" as it encourages us to "ask questions not only about who and what were involved in governing the world but also about how any particular form of organization came about and the results of its particular mechanisms of control."

Considering the overlap between these definitions, we can distill five widely shared assumptions and commitments which, taken together, distinguish global governance from other approaches. Being both political and analytical in nature, these assumptions and commitments entail (1) the notion that "order" and governance on the global scale are dynamic and are likely to change over time and (2) the perception that recent changes are driven by new governance problems which are potentially global in nature and hence demand global solutions, translating into (3) the analytical need to consider other actors beyond the state engaged in the provisions of such solutions motivated by (4) the empirical realization that current provisions of "order" and governance on the global scale have become decoupled from formal-legal authority and ruling through coercive force as well as (5) the normative impetus to contribute to and direct future change. None of these assumptions and commitments are exclusively (or necessarily for the first time) advanced within the notion of global governance. Taken together, however, they define global governance as an approach to *studying* and *doing* world politics in which both practitioners and scholars perceive the current state of world order as diffuse, polyarchic, and multilayered. As will be shown in the next section, this approach, whose intellectual origins can be dated back to the early 1990s, soon gained momentum in and beyond IR and quickly became an important contender within the discipline.

## Global Governance and Its Disciplinary Contexts of Emergence

Governance and order on a global scale in general as well as the role and influence of international organizations in particular have always played an important role in IR thinking. Against the background of accelerated globalization and ground-shaking events surrounding the end of the Cold War, however, interest in these *topoi* gained new momentum in the early 1990s. "Officially introduced" to the field with the publication of James Rosenau and Ernst-Otto Czempiel's edited volume on *Governance Without Government* (Rosenau and Czempiel 1992), this new approach soon received its name and intellectual home in the quarterly journal of *Global Governance* (Coate and Murphy 1995). Infused into a discipline suffering from and struggling with its self-made straightjackets of state-centrism, paradigm wars, and rationalism, global governance, despite its vagueness, quickly gained space and soon established a new disciplinary narrative to be reckoned with (Barnett and Sikkink 2008). It did so by (1) "annexing" the English School and regime theory with their foci on intergovernmental organizations and international law as well as the study of transnational actors, (2) challenging the assumingly nonnormative commitments of mainstream IR toward rigorous analytical theorizing, and (3) connecting to (social) constructivism which, taken together, opened the discipline to alternative knowledge claims in both methodological and substantial terms.

First, in terms of intellectual predecessors, the English School, regime theory, and the study of transnational actors stand out in particular. Vis-à-vis each of these, global governance presented itself as the more encompassing, more holistic approach. In multiple supersessions, global governance intellectually connected to all three strands yet at the same time reframed them and monopolized their assumptions in unique ways. For those who already studied intergovernmental organizations, international law, and transnational actors, global governance offered a new perspective to relate to and restate the relevance of their studies. For those who argued against such considerations, global governance appeared to be a much larger contender than previous approaches simply because real-world developments made a stronger case for these topics than ever before (see below). Ultimately, instead of embracing and explicating intellectual proximity and thematic resemblance with established research traditions in order to specify the approach, early global governance scholars emphasized the novelty of their perspective. In intellectual history terms, it can thus be argued that much of the attractiveness that allowed global governance to climb from the "ranks of the unknown to one of the central orienting themes in the practice and study of international affairs" with "its near-celebrity status" today originated in finding the sweet spot between drawing on and at the same time differentiating itself from other established approaches in IR (Barnett and Duvall 2005, 1).

Second, just as its flagship publication *International Organizations*, the field of IR as a whole heavily shifted toward analytical theorizing during the 1980s. As a consequence of this shift, explicit normative commitments to global policies became something IR scholars frowned upon. Such a heavy reliance on a particular philosophy of science, however, evoked criticism and opened new windows of opportunities. As Sinclair (2012, 16) critically put it, IR as an intellectual enterprise "increasingly drew back from matters of international policy and instead became a vehicle for the development of rigorous academic theorizing" against which global governance emphasized the political and hence normative nature of its topics. As such, while mainstream IR became skeptical of any sort of value commitment, global governance proponents were not shy to discuss the possibility of a "better world" and turned their normative commitments into one of the defining assets of their new approach. Consequentially, important questions such as "what forms of organization and governance should prevail, how scarce resources should be allocated, and what kind of policy ought to be put in place" were raised, discussed, and answered within a global governance framework not afraid of such debates and normative commitments which only further added to the

attractiveness of the new intellectual contender (Weiss and Wilkinson 2014a).

Third and connecting to the rise of (social) constructivism as another new paradigm in IR, such normative commitments translated into broader critiques of mainstream IR, its philosophy of science, its methods, and its study themes. However, whereas constructivists advanced their arguments from a theoretically inspired perspective and explicitly included methodological and epistemological critiques in their writings, global governance scholars for the most part were concerned with real-world changes and their substantial implications for world order. In other words, global governance became more of an empirically driven exercise and, other than constructivism, remained more or less noncommitted to epistemological or methodological debates and claims (Ba and Hoffmann 2005). Taken together, constructivism and global governance, almost in an implicit division of labor, collectively opened the discipline to alternative knowledge claims in both methodological and substantial terms and thereby created a much-needed intellectual space to engage with and make sense of real-world developments occurring parallel to these disciplinary dynamics.

## Global Governance and Its Current Manifestations

Being a concept "born from a marriage between academic theory and practical policy" (Weiss and Wilkinson 2014c, 208), the emergence of global governance was equally driven by disciplinary dynamics as well as real-world developments. More precisely, the intellectual notion of challenging conventional ways of *studying* global issues was strongly motivated by the political notion that traditional arrangements of *solving* global issues were failing. Under the immediate influence of the Cold War ending, scholars of world politics in the early 1990s in this sense were equally influenced by optimism and high hopes as well as anxiety, disgruntlement, and dissatisfaction with the new world order proclaimed by contemporaries. Living in "a time when hegemons are declining, when boundaries (and the walls that seal them) are disappearing, when squares of the worlds cities are crowded with citizens challenging authorities" (Rosenau 1992, 1), both practitioners and academics alike felt that their time marked a turning point in history. Described by some as the end of history (Fukuyama 1992), Coate and Murphy (1995, 1) wrote in their first editors' note of *Global Governance* that it was a time of "great hope and great hopelessness, a time when ideological fault lines have disappeared, while the global rifts of wealth and power have widened." In the same year, the already mentioned Report of the Global Commission was all grist to the mill of global governance proponents. Proclaiming a "new world" and assessing that there was no alternative to global governance, the singularity and novelty of the time as well as the opportunities that supposedly followed from this became a new *mantra* for those engaged with and interested in world politics.

The end of the Cold War and the Global Commission report, however, were not the only points of reference that bestowed global governance advocates with a collective identity and new themes. In a sense, both only reflected the larger, more foundational development of increased globalization that affected (and continues to affect) our human condition and the nature of our time. It was strongly perceived around the mid-1990s that all spheres of life – culture, communication, and travel, production and markets, money and finance, and ecology and health – had accelerated to the extent that scholars and politicians were exposed to global dynamics unlike before. Living in such a globalized world was referred to as living in a "world of increased complexity" in which previous ordering principles (e.g., the state and intergovernmental organizations) were deemed to have failed as "domestic problems" became "global problems." Transnational crime and terrorism; trafficking of people, weapons, and drugs; global warming; financial (in)stability; and global trade, it was concluded, were universal in their scope and diminished state capacities to maintain the integrity and welfare of their citizens. Consequentially, practitioners and academics alike felt helpless to grasp, let alone

govern, these issues and saw in global governance at least a potential answer when traditional government approaches failed. Ultimately, the enthusiasm as well as the desperation the historical context brought with it strongly pushed the practice *and* the study of world politics toward embracing global governance as a new concept despite its ambiguity. As Latham (1999, 24) put it, a notion deliberately "open and diffuse, if not a little non-committal," appealed to contemporaries since these were "attractive qualities in an era of ambiguity, uncertainty, and flux."

Quickly gaining momentum, global governance soon became a self-fulfilling prophecy for both the practice and the study of world politics. Throughout the 1990s, with national and international politics increasingly merging, we saw both regional arrangements beyond the state fostering as well as stronger commitment to the UN on a global scale. State actors felt that almost all aspects of their decision-making was influenced by complex interdependence and hence advanced the notion that all policies were *foreign* policies. Globally, with various degrees of institutionalization and authority diffusing between different actors, intergovernmental organizations overall developed more autonomy and hence became more influential in world politics (Karns and Mingst 2010). In addition and probably even more important for global governance, non-state actors became more and more involved in private authority and transnational governance. Whether through NGO monitoring and shaming or multinational enterprises developing their own standards, these actors began to contribute to and shape global debates unlike ever before (Held and Hale 2011). These trends – the internationalization of domestic politics and the ensuing proliferation of multilateralism, intergovernmentalism, and transnational governance – were further reinforced as almost all actors and institutions involved in global governance embraced a "partnering norm" of collective problem-solving. As such, states, IOs, NGOs, and enterprises not only became engaged in global governance individually. They also collectively created a plethora of multi-stakeholder initiatives which only further increased the diffusion of authority, the informalization of governance, and the integration of non-state actors.

Where do these developments leave us today? What are the major characteristics of the current manifestation of global governance? The most remarking aspect probably is the immense, almost infinite complexity that follows from a multilayered, multi-actor, polycentric, and diffused global order. We have to start any account of global governance with the state and emphasize that even in the twenty-first century, they remain key actors with their sovereignty qualified but not compromised. Next we need to add the layer of intergovernmentalism and consider both regional and global IOs. As such, global governance scholars put a particular emphasis on the UN system (Weiss et al. 2010) and on the importance of regional arrangements (Herz 2014). On both the regional and the global levels, however, we see organizations formerly defined by their intergovernmental nature increasingly relying on non-state actors as they embrace and sponsor initiatives such as the *UN Global Compact*; the *Extractive Industry Transparency Initiative*; the *Global Fund to Fight AIDS*, *Tuberculosis and Malaria*; and the *World Commission on Dams*, to name only a few from a seemingly endless list. In these networks and multi-stakeholder partnerships, we also find local, substate agencies independently engaged as well as a certain reliance on specialized epistemic communities and their experts, completing a complex picture of overarching authorities. This plethora of different "global governors" with diverse resources, interests, and constituencies is engaged in different governance activities from advocating and creating to implementing and enforcing norms and policies which ultimately, to no big surprise, create diffused and unclear responsibilities as well as issues of accountability (see below). Configurations and arrangements vary from issue to issue, implying that we have an almost endless arrangement of different and overlapping governance systems constituting an overall messy, if not chaotic, architecture of global governance. In other words, global governance today is characterized by complex interplays of cooperation, coordination, competition, and contestation between

global, regional, national, subnational, and non-state actors. To no surprise, as will be elaborated in the next section, this global patchwork of arrangements remains disputed both academically and politically.

## Current Debates and Future Research

Against the background of the outlined disciplinary and real-world dynamics, two major debates along the lines of *how* much global governance and *what kind* of global governance we want today stand out. Each debate involves a multitude of scholars and diverse perspectives which can only be aggregated here to the point where individual contributions do not receive the credit they should receive. With this said, in the first debate, scholars and practitioners alike discuss the overall quality, scale, and depth of the current global governance system. Given the explicit normative impetus of many global governance proponents, it comes as no surprise that assessments differ. These range from affirmative approaches emphasizing the advantages of current global governance over state-centered governance as we experienced it in prior times. Not only are global issues more efficiently tackled, the increased integration of a broad range of different stakeholders also, accordingly to this position, adds to the overall legitimacy of the current order (Ruggie 2004). Others, often informed by Marxist or Historical Materialist thinking, challenge the underlying functionalist logic of global governance, disapprovingly discuss it as a consequence of neoliberalism, critically assess singular initiatives and partnerships, and ultimately reject its legitimacy. Particularly the integration of private actors, so the argument continues, does not offer solutions but is rather part of the problem (Cox 1997; Murphy 2000).

Between these two positions, we see middle-ground approaches concerned with honing our conceptual tools and theories to better understand and assess global governance. Important dimensions in this are efficiency and legitimacy of governance. Consensus begins to emerge along the lines that considerations of "getting the job done" need to be related to issues of accountability and representation. Simply put, allowing everyone to speak does not imply that everyone is equally well heard as different actors, both state and non-state, command different resources and capabilities. Given that this allows them to influence global governance processes to larger extents, it raises legitimacy concerns about the overall quality of global governance. In addition, since many global governors lack any form of democratic accountability and represent specific constituencies (i.e., *share*holders, not *stake*holders), it has been argued that global governance needs to be grounded in better frameworks that directly connect the ruled with the rulers by allowing the former to choose and potentially replace the latter. Whether such democratic notions are possible on a global scale and whether this will ultimately improve the quality of global governance remain to be seen. For the time being, these issues are at least debated while so far "we have failed as agents of change; that is, as purveyors of opinion and proposals about a better and fairer world order" as global injustices, inequalities, and violence remain real for most people on this planet despite different commitments (and hopes) expressed in global governance (Weiss and Wilkinson 2014a, 19).

The second major debate revolves around the contested conceptual status of global governance. Being advanced at the same time as a policy notion with its origins in the practitioner's discourse, an empirical condition of a changed "world out there," and an analytical tool to study and assess this change, global governance from its very inception semantically entailed and continues to entail today a wide range of diverging meanings. In other words, global governance denominates the activities of actors engaged in world politics, is intellectually condensed into a paradigmatic description thereof, and provides the conceptual tools and the ontology to scientifically grasp and study them. Just as with *I*nternational *R*elations, the use of capital letters to distinguish a field engaged in intellectual reflection from the real-world substance it is interested in could already help clarify whether we refer to the object of study (i.e., *g*lobal *g*overnance) or the collective

academic enterprise (i.e., *G*lobal *G*overnance). With this distinction not made yet as well as skeptical voices still questioning its ability to explain anything, global governance does not constitute a full-fledged research tradition (yet). Rather, it appears to be in a "theoretical interregnum" (Pegram and Acuto 2015) and constitutes, at best, a "theory [still] in the making" (Dingwerth and Pattberg 2006, 189). It is in particular the conflation of political commitments, empirical descriptions, and theoretical explanations which makes the notion attractive but also sustains much of the confusion surrounding it. In other words, global governance today is both the question *and* the answer to "what makes the world hang together," and further discussion is needed to fully realize its analytical value (Ruggie 1998).

In addition to conceptual conflation, further adding to the confusion surrounding global governance is the fact that its position in relation to the field of IR has never been quite decided. Framed by some as unwarranted distraction and hence unworthy of engaging with at all, others hail (ed) global governance as a potential savior which will not only reinvent but ultimately supersede the discipline (Ba and Hoffmann 2005). Advocates for disciplinary reinvention emphasize global governance's potential to foster interdisciplinary exchange and overcome IR's reluctance to embrace normativity. Such an intellectual transition, many argue, needs to be accompanied by institutional transition as well. The introduction of *Global Governance* in 1995 as a "quarterly [intended] to return to the global problem-solving origins of the leading journal in the field, which seemed to have lost its way" (Weiss and Wilkinson 2014c, 208), in fact already marked an early step in this direction. Today, with IR fragmenting into different subfields and special interest areas, we see a proliferation of explicitly dedicated research centers, conferences, and workshops on global governance as well as specialized degree programs emerging. Again, it remains to be seen whether this improves the quality of the research agenda. Ultimately, what is already at stake, though, are the foundational narratives as well as the future of the discipline of IR, and the prominence of global governance in one way or another will change both the substantial the institutional faces of our academic enterprise (Barnett and Sikkink 2008).

Whether one hails these changes or condemns them, at least four conceptual challenges remain unresolved in current global governance thinking. First, it remains to be seen whether global governance can shed its functional bias and move beyond its "managerial vision" currently applied to global issues. Often framed as an "unavoidable consequence of globalization," global governance advocates in this context the need to develop better justifications for studying (and promoting) change (Sinclair 2012, 5). Second, global governance research has to embrace a historical dimension and realize that its subject existed long before it was captured in academic terminology. Studying previous forms and manifestations of global governance will provide scholars with a better grasp on how a particular order of governance came to be in the first place (and ceased at a later stage) as well as an overall better understanding of the core theme of change (Murphy 2014). Third, given its passive focus on structures, global governance research in the future needs to emphasize and theorize the notion of agency. While global governance is all about "how the world is governed" (Weiss and Wilkinson 2014a, 25), we need to know more about the governors involved (Avant et al. 2010). Fourth and finally, processes of governance will remain contested, and these contestations will be resolved through exercises of power which is why global governance has to develop better conceptualizations of power as a relational disposition beyond legal-formal authority (Lake 2010; Barnett and Duvall 2005).

## Conclusion

How and whether these challenges will be tackled will determine future directions of global governance research. For the time being one can conclude that despite all the ambiguity and debates surrounding the concept, it simply has become "too important [and too influential] to just let go" (Dingwerth and Pattberg 2006, 198).

Considering the impeding and sterile paradigm wars IR was engaged in during the 1990s as well as its inherent state-centrism, global governance significantly advanced the field and created space for new themes and approaches. In this sense, the debates surrounding global governance can be perceived as indicators of the liveliness and relevance of the notion. Put simply, there appears to be something to global governance that keeps us engaged with it. While oftentimes disappointing and frustratingly confusing, intellectual progress of the global governance research agenda overall, at least for the time being, should thus not be measured in terms of coming up with the right answers but rather in terms of raising the right questions. As Weiss and Wilkinson (2014c, 207) remind us, whatever shortcomings current global governance thinking might feature, it still represents a shorthand "useful for describing growing complexity in the way the world is organized and authority is exercised." Accepting the confusion inherent in any exercise as complex as studying world order while still committing to further realizing its analytical value collectively is on us as we owe it to the intellectual ingenuity expressed by the many great minds involved in more than 20 years of global governance research.

## Introduction

Governance is a highly contextual term. It can be used in different ways in public policy and public administration, organizational theory, international relations, models of corporate governance, and approaches to "good governance." As this chapter is addressing global and national governance, governance is approached in a more open-ended context. Global and national governance are encompassing categories; the first refers to the world, the second to what is widely understood as the principal unit of contemporary political order throughout the world: the state. The systems of political and economic power which shape fundamental dimensions of our world are not fixed, but changing, with significant transitions underway. Moreover, these systems are in close feedback loops with local and global ecological dynamics; as trajectories of governance have affected ecological balances, climate change will have deep, unpredictable impacts on collective human life, presenting profound challenges for governance. Questions of how the world was and is governed (in its more local or more global dimensions) and how it can or should be governed are journeys of exploration. This chapter contributes by looking at some of the themes that emerge in discussions of global and national governance, and calls into view a dimension that can be overlooked, but has something to say to both.

Global and national governance are in dynamic interaction, empirically and conceptually. This chapter first considers governance in general terms and then discusses global and then national governance. The discussion concerns empirical states of affairs, but since what we see is profoundly shaped by how we look, it is significantly conceptual. At points throughout the discussion, the chapter considers "local," societal sources of governance. Societal sources of order are important for all populations; for a substantial proportion of the world's population, however, they are the primary source of governance and thus fundamentally significant. Societal or "local" governance could be understood to be included in both national and global governance. In important ways, it is. In the places where people speak for national or global governance, however, it is rarely recognized, or part of the conversation (Muehlebach).

## Governance

Governance could be understood as the ways we organize ourselves to live together or to undertake certain kinds of ongoing activity. This involves questions of the systemic, collective exercise of power, but power in its various faces. That is, governance concerns not simply power as command or coercion but also the power to attract, persuade, and hold together, to resist and withdraw, to shape habits and values, and to make meaning and interpret it. In this understanding, power is dynamic, moving throughout a system of relations and interactions, and not only held by some over others. While power certainly operates as command, over time most governance systems involve processes of resistance, exchange, and negotiation. Governance is not, then, simply the assertion of rules or norms, but those processes by which norms and institutions are produced and authority and legitimacy established. Governance

thus concerns systems and practices of power by which different kinds of collectivities seek to order interactions and to shape and respond to their environment (or some part of it) over time. Questions of accountability and legitimacy are central to this activity. Much writing on governance focuses on the governing agent, or the regulatory system. While this focus often makes sense in practical terms, governance fundamentally concerns the quality, character, and system of relations circulating among governing and governed or across the collectivity.

The collectivities referred to could be families, kin networks, towns, institutions, enterprises, societies, states, and so forth. These are clearly not separate entities but interweaving and often contending systems whose organization may be dense or loose, tightly defined, or open-ended. Governance also includes the messy, often incoherent processes by which interdependent, overlapping, or autonomous bodies manage their relations and undertake tasks, forming larger networks or more complex hierarchies – that is, how different kinds of collectivities "hang together" (Weiss and Wilkinson 2014).

Governance is an inclusive term. It can include "government." Definitions of governance given by both the Commission on Global Governance and The Council of Rome explicitly include government. But governance can also be distinguished from government by virtue of its very generality. Government is the key activity of a state and identified with a centralized body of institutions which has a monopoly over aspects of making, monitoring, and enforcing a dense complex of rules, regulations, and norms covering a specified range of activities across the territory of a state. Governance recognizes a wider, potentially less hierarchical and more fluid range of ways by which rules can be generated, activity oriented, and societies steered (Rosenau 1995).

This tension between governance and government points to themes recurrent in discussions of national and global governance. One concerns "top-down" and "bottom-up" orientations, with government being classed as more top down and hierarchical. While governance can be associated with either, it can enable recognition of bottom up, or relatively horizontal, forms of social and political ordering, as well as of more fluid processes of decision-making. The other, related theme concerns questions of accountability, the legitimacy of authority, and the nature of appropriate participation and communication. All forms of governance, top down, bottom up, or horizontal, raise these questions. In the contemporary world, however, it is the governments of states that have been principally charged with accountability to and for their populations. Many governments clearly do not or cannot fulfil these responsibilities. At the same time, in practice, there can be many forms of accountability and participation at work in the ways communities live and organizations operate, some fundamental to people's life chances. Nevertheless, democracy, popular sovereignty, and political accountability have been fundamentally conceptualized within the state and in institutional terms rest finally with government. Questions of global and transnational governance, then, automatically raise issues of how accountability and participation ("citizenship") might be understood and exercised beyond traditional conceptualizations of the state.

In international political and legal terms, the state is a fundamental building block of contemporary world order and, in principle at least, the primary context within which societies can seek a range of political goods, including accountability, participation, justice, security, and self-determination. It is not only a matter of *realpolitik* then that states and models of how they in principle operate – top down, centralized, with coercive capacity, but a key point of accountability nationally and internationally – remain a significant point of reference for much thinking about not only national but global governance. Demand for global governance is significantly driven by realization of the limitations of state power, capacities, and accountability, but many conceptions of global governance remain in one way or another dependent on traditional models of statehood. The United Nations is central to much discussion of global governance, but is an organization of states, as are a range of key centers of power in global decision-making. Nevertheless, categories of global and national governance open more

searching lines of enquiry about the sources and interplay of social, political, and economic systems of collective power.

Concepts of governance, for example, enable attention to forms of order that underpin the life of communities in many parts of the world but that are scarcely taken into account by prevailing models of the state. In much of the global South, fundamental elements of governance are societal or "local." In sub-Saharan Africa, for example, the great majority of peace, security, and justice functions – functions usually identified as critical responsibilities of state institutions – are provided by societal bodies, including customary networks and authorities. While often "local," face-to-face networks, these patterns of authority may simultaneously stretch across the country and be part of transnational systems of relations. "Global" and "national" are often thought of as levels in a vertical hierarchy. This can be misleading, however. The "global" is saturated with the "national" and vice versa; issues arising within a state (epidemic disease, civil war, nuclear weapons, financial collapse etc., as well as the management of or resistance to these things) can, and often do, have global significance and vice versa. This point extends to the "local." The local can be small scale, geographically contained, or parochial; it can also be where communities interact with far-reaching networks of communication, trade, criminality, security, and migration, where people struggle with dilemmas of war and peace, terrorism, climate change, or epidemic disease and where creative responses to existential challenges can emerge. Understanding "how things hang together" needs to take these dimensions of governance into account, not least because they concern a significant proportion of the global population. The significance of societal sources of governance also raises questions of participation and accountability "within" these systems but also on the part of global and national institutions to the communities involved. To what extent are the more officially "global" level of global governance and the "national" level of national government accountable to, and in exchange with, communities of the global South?

## Global Governance

Debate about global governance is inevitably significantly conceptual. There is no plainly established set of objects and processes to which "global governance" refers. What then might the term enable us to do conceptually, politically, or ethically? Indeed, when it is not a discussion of the management of particular transnational issues, from climate change to nuclear weapons to overviewing international postal services, much discussion about global governance is debate about what the term means or should mean (Whitman 2009). Debate does not mean that the term has no value, however. Rather, it reflects the challenges of conceptualizing the changing ways we live together in the broader ecology of the world, the new demands imposed by change, and how to work with the need to shape these patterns of interaction less destructively and dangerously.

Foci of debate include whether global governance refers primarily to institutions and processes that already exist (but need reform) or whether it requires something radically new that needs to be created. If it already exists, does it consist of the dense network of sometimes conflicting, sometimes collaborating multilateral, state and civil society institutions, norms, and processes which already significantly shape transnational interactions (known as complex multilateralism)? Is it centralized around key international organizations, notably the United Nations? Or does global governance rest rather with the balance of economic and political power which, while shifting, is still seen as resting largely with major states and corporations of the global North, the transnational institutions they dominate, and what is sometimes identified as Anglo-Saxon modes of capitalism? Given entrenched patterns of economic and political power is the emergence of a more genuinely collaborative system conceivable? Or is global governance a truly all-inclusive category which refers to all those multiple forms of governance which have relevance across borders, without being limited to the "global level"? If global governance needs to be created, is it understood as a nonhierarchical web or a centralized coordinating body – perhaps a

radically reformed UN operating as an authoritative, autonomous assembly of democratic peoples (Held 1995)? Should state (interstate) or non-state actors be the leading figures? In either case, what forms of accountability would bind its operations, and under what political conditions and how might it be brought about?

Contemporary ideas of global governance emerged on the back of a growing awareness of societies' complex vulnerabilities to intensifying globalization. Changing patterns of global interaction have long-shaped history. Globalization has enabled many of the benefits of people's collective lives, including material and cultural enrichment and scientific and technological advances. The benefits and costs of these dynamics, however, are distributed in deeply unequal ways. The impacts of globalization are substantially shaped by dominant systems of economic and political interaction; in this context, globalization has led to intensifying global inequality, entrenched patterns of violence, and major irregular population movements, among other problems. It has resulted in changes to the world's climate that have pushed the global ecology deep into uncharted territory. While unevenly distributed, these impacts are extensive and growing. Such effects are not inherent to globalization. Through increasing velocity and synergies, globalization has entered a potent new phase of both constructive and destructive potentials, but its impacts are largely shaped by global political and economic patterns of interaction (Whitman 2009). The recognition that collective problems are intensifying and require collaborative solutions is a strong impetus driving interest in global governance.

It was the devastation of the twentieth-century world wars that focused attention on the dangers of increasing global interdependence and the need to find ways to manage them. First the League of Nations, following WW1, and then the United Nations, following WW2, were established to restrain the use of weapons of mass destruction and to avoid further major war through collaborative action. They were to be "world" bodies, but the sense of what constituted "the world" reflected their time. For the League, the "world" did not include the colonies. By 1945, the UN embraced principles of self-determination. Over time, decolonization has extended UN membership to 193 states. The world was and continues to be understood as constituted by states, with populations represented in principle by their governments, and international organizations complement to, if potentially also restraints on, state power. The character of statehood, however, is both deeply heterogeneous and changing.

A suite of agencies, treaties, and norms emerged under the aegis of the UN. These undertook to control nuclear weapons, help regulate trade and support economic development (the Bretton Woods institutions), manage or respond to crises and diverse interstate stresses, improve living conditions for vulnerable sectors of the globe, and promulgate human rights norms while respecting sovereignty. As well as improving well-being, these were efforts to reduce factors seen to cause war. They were informed by what has become known as "embedded liberalism" or the welfare state: a new vision of the social contract (underpinned by a Keynesian interpretation of the slide into the Second World War) where support for more globalized trade was balanced by national and international regulation and (where possible) social welfare provision. The Cold War, running from soon after the establishment of the UN until 1989, severely limited potential for cooperation, particularly regarding war and peace, but did not entirely remove it.

For states of the global North, however, the scope of state power has been shifting since the establishment of the UN. Intensifying regional and global interconnectedness has been redistributing decision-making powers around a spectrum of economic, political, and social issues previously associated with national governments (Held 1995). These developments have changed the dynamics of national political systems, reducing the capacity of governments to steer developments within the state and altering channels for accountability between citizens and government. Commitment to socially embedded liberalism has given way to the neoliberalism of small government and enhanced market power associated with Anglo-Saxon modes of capitalism, not only in key

states but in international economic institutions. By the end of the Cold War, demand for international institutions to take greater responsibility for dealing with transnational issues, including managing some of the negative effects of economic globalization, was growing, as was frustration with the limitations of the sovereignty-based, post-World War II institutions. There are other dynamics of change and forms of heterogeneity affecting states. Beyond the global North, for many of the more recently decolonized states, the state as political community was and is still in early stages of emergence. At the same time, the balance of power among states, including their relative power within key transnational institutions, has been shifting over the several decades since the UN was established. This period has seen the demise of the Soviet Union, the weakening of the United States, the emergence of Russia, and the rise of China and, to a lesser extent, India.

The League of Nations and the UN emerged from responses to devastating war but were also informed by long-standing traditions of political thought concerning world government. Far from being a world government, the United Nations is dependent upon the states which make it up. Kantian political thought saw a non-authoritarian world government as the ultimate evolution from a federation of independent, "rational," and like-minded states. Belief in the value of a literal "world government," with its potential for totalitarianism, has receded dramatically. Nevertheless, although the idea of global governance is often framed in contrast to world government, the idea of a central global sovereignty, perhaps with coercive power, in effect a traditional state writ large, remains a common point of reference. Similarly, while hopes for a more truly global form of governance are often counterpointed to interstate organizations, the imprint of the United Nations and sister bodies such as the World Bank orders much thinking about global governance. The UN represents, or aspires to, a centralized coordinating role for what has become known as complex multilateralism. Debates and experiments around reform are ongoing; for example, with Responsibility to Protect, the UN has sought to revive some coercive function under highly restricted conditions, with mixed results. Some radical agendas for UN reform seek to transform it into a mechanism for cosmopolitan, transnational democratic accountability and participation that can account for the changing scope of state power and meet the growing need for democratic ordering of the global domain of multileveled, overlapping emergent political centers (subnational, national, regional, issue specific, and global). This is a vision of the UN as an authoritative institution setting the framework for grappling with pressing global problems, potentially with some autonomous coercive power (Held 1995).

A complex network of transnational, societal, and government bodies, including the UN, provide significant levels of governance, undertaking a wide spectrum of cooperative problem-solving endeavors and providing significant responses to political and natural disasters. While this network is not a unified system, to a significant extent it operates according to a shared, dominant form of organization and communication that is technocratic, bureaucratic, rational-legal, codified, and regularized. This mode of organization, which could be seen as drawing from, and grounded in, dominant models of state organization, frames the operation of international governance institutions (James and Soguk 2014). In a vertical hierarchy of levels, the UN and other international institutions can claim a rarified place; there is little chance of mutual exchange with, or input from, the "local" forms of governance mentioned earlier, for example. This is not simply because the "grassroots" is far away but because the sociocultural models of person, community, legitimacy, and authority can be profoundly different than the world of elite bureaucracy. The UN may be an alternative to the hierarchy of world government but remains within its own hierarchical, top-down approach to governance with little way of relating with the concerns and values of large sections of the global population.

A more active role for social movements and non-state bodies does not automatically reverse this limitation. Nongovernment organizations can provide invaluable services under intensely difficult conditions. While they can make

important contributions to the pursuit of goals of democracy and human rights, however, in the international arena they cannot provide channels of democratic participation or accountability nor are they able to represent those voices or issues which do not translate into rationalist bureaucratic norms of exchange. Transnational civil society does not necessarily speak for significant elements of the global population, particularly those in the formerly colonized world, nor is it accountable to them. There have been efforts to respond to this limitation. The Multilateralism and the United Nations System (MUNS) project, for example, sought to stimulate movement toward a grassroots multilateralism built from the foundations of a global, participative civil society. Models of cosmopolitan citizenship seek to explore ways in which the democratic accountabilities that have been sought with mixed results in the state might be established and deepened in transnational governance institutions. These are important contributions to political ethical debate. Nevertheless, these cosmopolitan trajectories find it difficult to extend beyond dominant European and North American models of the individual and community. The activism of indigenous peoples seeking voice and representation within the UN has helped open debate to wider conceptions of political community and selfhood and challenged the normative and organizational foundation of international political exchange (Muehlebach 2003).

An alternative approach is to see global governance as including all efforts to exercise authority at all levels of human activity (Rosenau 1995). This expansive definition includes the United Nations and other transnational organizations but does not take them as singular models or containers for governance. Nor are only those forms of governance mediated through rational-legal modes of technocratic exchange included. This view does not erect obstacles to seeing "local" sources of order or different constructions of statehood. Nor, however, does it satisfy the desire to identify a coherent mechanism through which response to fundamental collective challenges is possible. For this approach, the ongoing challenge of working simply with what is there is all that is available. What this perspective does enable is better recognition of the complex responses that are already underway, in conflicting and incommensurate as well as complementary and coordinated ways. It enables the United Nations and a council of elders, a corporate board, an NGO panel, and a women's committee to come into view, but the perspective within which they are grasped is one of global interconnection. By bringing them all into frame, it allows a "thicker" view of interconnecting networks of governance. This enables recognition of profoundly different forms of governance and of the critical role any of them might find themselves playing, independently or together, without claiming equivalence among them. Ways of thinking about global governance that are less marginalizing of substantial populations and ways of living become a little more possible. Crafting ways of acting on this realization can be pursued at different "levels" and in different sites.

## National Governance

National governance refers to the pursuit of sociopolitical and socioeconomic order within a state. This could be understood to include, but is not limited to, the institutions of government. Institutions of government are an essential part of national governance, but the ways in which they are important, and how important they are in the mix, vary significantly across states. Governance addresses questions of legitimacy and accountability and thus concerns the dynamic web of interactions linking governing and governed, rather than being located entirely within an institution. There is a process of mutual exchange at work, in which fundamental political, economic, and legal institutions work to a significant extent because they are embedded in networks of social norms and practices, which in turn institutions help to regulate. National governance could thus be understood as the web of interaction and exchange, and channels of accountability and communication, linking government and other forms of social, political, and economic organization across the fundamental elements of people's collective lives.

Bodies of scholarship address interlocking dimensions of governance in the states of the global North. Discussions range from investigations of different areas of sectoral management (e.g., the banking industry leading up to the global financial crisis) and public-private partnerships to the perspectives brought by scholars of governmentality. Governmentality explores those technologies which seek to manage the habits and actions of subjects, including through shaping the sense of self and its internalization of norms, in order to strengthen the state and dominant forms of power (Miller and Rose 2008).

One critical focus concerns the impact of global interconnectedness in the context of the dominant global economic system on democratic accountability, popular sovereignty, and inequality within states. Increasing economic globalization, including the power of transnational corporations, worldwide production chains, loss of taxing capacity, and international financial institutions, has reduced governments' ability to direct economic policy and weakened the ability of the welfare state to counteract capitalism's harshest features. Inequality has intensified within many states in both the global North and South, even as the gap between the North and South has reduced. This has exacerbated conditions of political, social, and economic instability. Neoliberalism has further fragmented the capacity of governments to steer policy (Rhodes 2007). As governments became "small," other bodies and interests with significant sectoral power increasingly shaped policy agendas. The tension between nationally based democracy and transnational decision-making poses fundamental, long-term challenges to democratic processes and public accountability. In the international arena, "small government" became a central feature of governance frameworks promoted by international agencies, with significant consequences for government accountability and corruption in many postcolonial regions.

In many states of the global South, national governance faces an additional challenge of a different order. In the decades following WW2, the United Nations played a leading role supporting decolonization, so contributing to a shift in world order. As part of this role, the UN has supported, at both generic and concrete levels, certain models of what constitutes statehood, government, and governance. The templates of the state promoted in much international state-building give the impression of remarkable conformity. Centralized government institutions, with a monopoly over the legitimate use of force and tax-raising powers, operate across a defined territory and population. A unitary system of legal and political institutions is responsible for justice, accountability, security, and a range of social services. Public institutions operate according to a rational-legal model of decision-making. An electoral system underpins basic mechanisms for representation, participation, and political accountability. The governing institutions of the state are distinct from society, over which they exercise authoritative power. This is a model of the centralized, hierarchical, top-down sovereign power, separate from but accountable to citizens. The person is taken be a self-interest maximizing, rational, competitive individual, while the economy is founded on private property and free market exchange. This model flows from a liberal, technocratic construction of political and economic order, the person, collective human relations, and their place in broader ecological relations.

This template articulates potent governance values with significant effects. It is not, however, a reliable account of how governments in the global North actually work. States are increasingly porous, and government is often not so clearly demarcated from other bodies. The modern state governs through a complex network of formal and informal relations and bargaining across a spectrum of state and non-state institutions and associations (Miller and Rose 2008; Rhodes 2007). In addition, state-building has often proceeded by "transferring" governance institutions to another society, so underestimating the importance to accountability and legitimacy of the tissue of relations linking state institutions with societal sources of order and norms.

If the picture of government directly setting national policy no longer holds for many established states, across much of the postcolonial

world, state institutions are often relatively recent introductions and have limited reach. Across many regions, management of fundamental dimensions of collective life, including everyday security, conflict management, much justice provision, food security, and social welfare, depends not on the formal agents of the state as much as on clan networks, village councils, town elders, neighborhood watch arrangements, and other "informal" or societal networks. While there is considerable variation, these societal networks can hold significant legitimacy and authority. They may work together with government actors, such as police, magistrates, and health workers, and with local NGOs or religious bodies in complex, shifting alliances. However these "informal" networks are positioned in relation to state institutions, in many parts of the world, the working order of the state and the everyday continuity of many people's lives exists to a significant extent by virtue of these community networks. Crisis management, survival in the face of war and predatory government, and management of refugee flows also rest not only with international interventions and government agencies but often, out of sight, with "informal" networks. This is not to suggest that "local" mechanisms can stand alone in the face of disaster, or in themselves constitute a state, but to underline that they are a significant, functional part of governance for much of the world's population.

Societal forms of governance are often overlooked by both international bodies and state agencies. Private property may not be the basis of economic exchange, land is often communally held, and expectations of what people owe each other can contrast sharply with the models of human behavior upon which significant elements of international governance are based. Forms of governance that do not fit prevailing international models can be seen as backward, irrational, violent, or patriarchal. They can be, as can the operation of state actors. The coexistence and enmeshment of profoundly different ways of generating political and social order, legitimacy, and accountability pose considerable challenges for national governance. If effective national governance is understood to include the development of networks linking state and societal governance institutions and mechanisms together in ways that are accountable and meaningful to communities, it is important that societal forms of governance come more clearly into view, not as signs of the past or of the failure of state-building but as dynamic and changing elements within the exchange of contemporary national and global governance.

## Conclusion

Contemporary societies face truly pressing challenges of governance: the need for collective responses to profound ecological, political, and social dilemmas, the construction of political mechanisms or systems able to hold shifting loci of economic and political power within and beyond the state to some form of account, and ongoing challenges of sociopolitical violence. These are existential challenges, and it is not clear how well we will meet them, either as a species (facing ecological pressures) or as interweaving societies seeking some level of justice (dealing with social, economic, and political dilemmas). Whatever forms progress might take, however, need to be based on better understanding of how we live together, a more informed grasp of the profound differences shaping global societies, and on working to undo deeply embedded forms of exclusion and marginalization that have shaped aspects of the dominant governance patterns of the last few centuries.

Political dynamics can move swiftly, and opportunities can emerge that allow what was unrealistic to become possible. Concepts of governance are valuable because they are a way of investigating changing patterns of collective power and their effects on life chances over time; they help us understand processes of change, and they challenge us to consider what it is we collectively value and seek in such processes. The investigation of changing governance dynamics can thus contribute to recognizing and shaping opportunities for change. Ideas of governance also draw attention to the significance of the relations among the

different elements making up a collective social order. Examining governance systems and practices brings to light not just the agents exercising governance but the nature of relations that make up the legitimacy, authority, accountability, and patterns of communication constituting sociopolitical order. In this sense, questions of governance highlight interdependence within a governance system but also, increasingly, across the networks among them. Greater understanding of interconnectedness and interdependence within and among patterns of governance needs to include a more concrete grasp of the different ways collectivities of various kinds shape their lives. Such understanding could change subtly but significantly how the search for effective forms of national and global governance is framed and enable more voices to be part of the conversation.

## Synonyms

Information economy; Knowledge society; Network society; Post-industrial society; Weightless world

The term Global Information Society is often used as a loose "umbrella term" to encapsulate the consolidation and universal expansion of the so-called Information Society in the last two decades. According to this first definition, the Global Information Society represents the more recent stage of a social and economic process that started after World War II and that builds on the growing and transformative role of information and communication technologies (Mattelart 2001; Webster 2002). This form of society first gained academic attention in the 1960s of the twentieth century. The early works focused on the increasing role of information-related activities in the economy of the United States, and they frequently restricted the Information Society to an Information Economy (Crawford 1983). Among these works – which include those of Fritz Machlup (1962), Peter F. Drucker (1969) or Marc Porat (1977) – the book of Daniel Bell (1973) was probably the most influential one. Depicting this international society as a post-industrial society, Bell put emphasis on the centrality of theoretical knowledge in informing decisions and promoting change. A few years later, the growing importance of information and

communication technologies in the economies and economic strategies of a significant number of developed States in the 1980s and early 1990s gave rise to new debates and resulted in a number of academic publications such as those of Raul L. Katz (1987), David Lyon (1988), or William J. Martin (1988). However, academic and political interest in the Information Society gained momentum by the mid-1990s with the emergence of Internet and the gradual advance of a "creative society that is based on interaction" that involves new technology but whose key component is a new way of doings things (Currie 1999; Himanen 2004; Martin 1995). The deep impact of Internet not only altered business practices, capital markets, and the role of work and flexible employment in the business-net model, but it also made innovation the key variable of productivity growth and placed it at the center of the new e-economy (Castells 2002). It is this more recent version of the Information Society that has been qualified as a Global Information Society.

The material basis of this new form of society is the paradigm of information technology. This consists of five main features. First, information is a primary resource and technologies act over information. This contrasts with previous moments in history when information was used to act over technology, but not the other way around. Second, new technologies have a profound influence on every human process, either individual or collective. Third, all systems or groups that use technology are deeply interconnected. Fourth, this new paradigm is also characterized by a high degree of flexibility: processes can be reversed and an alteration of the components of a particular organization or institution may result in their fundamental transformation. Constant change and organizational fluidity are thus two defining elements of this society. Finally, specific technologies tend to converge in a system that is highly integrated. This makes distinguishing traditional technologies in their practical operation a difficult task (Castells 2010). In parallel, in the new Global Information Society, information is unbundled from its original physical carriers; it does not follow a linear flow and can be distributed at a very low cost; and it allows for a more interactive and simultaneous way of communication. This society is highly interconnected through the use of information and communication technologies whose impact transcends material barriers. This form of organization helps a new model of economic growth based on innovations that are closely connected to human capital. Manuel Castells refers to this new society as a Network Society where social morphology takes precedence over social action and where domination and change are highly dependent on two variables: presence or absence in the network and the dynamics of each network vis-à-vis other networks (Castells 2000). The influence of this network form of social organization does not stop here and extends to issues as diverse as the development agenda (Castells and Himanen 2014), international mobility (Wilson et al. 2013), the ethical foundations of democracy (Berleur and Whitehouse 1997; Britz 2008), or the promotion and protection of Human Rights (Jørgensen 2006).

Partially following this definition, Johannes J. Britz, Peter J. Lor, I.E.M. Coetzee, and Ben C. Bester have identified four main criteria for the Global Information Society (Britz et al. 2006). The first one refers to the existence of a well-developed, well-maintained, and affordable infrastructure of information and communication technologies that allows for the development of global socioeconomic activities and political participation. The second makes reference to the capacity of individuals and actors to access relevant information required to fully engage in socioeconomic activities and political participation. This entails that the relevant information is not only affordable, but also available in a timely manner and in different languages and contexts. The third criterion consists of a robust and periodically updated physical infrastructure that ensures a continued and successful interconnection between immaterial information and material needs. Finally, the fourth refers to human capacity. The Global Information Society requires a diverse range of educational, research, and development facilities that foster the capacity of individuals and collectives to be creative and use information in order to produce knowledge and innovation (Britz

2008). The latter are essential to promote the economic growth and development needed for the viability and sustainability of this society (Himanen 2004).

The characterization of the Global Information Society as a new form of society has been challenged by some authors who have stressed that the underlying pillars of the contemporary socioeconomic system have only experienced minimal transformations (May 2002; Feather 2013). In contrast, the claim that a number of trends have a deep impact on the gradual spread and consolidation of this society has gained wider acceptance. Ten of them seem particularly relevant. First, the rise in the level of international tax competition among States resulting from the need to attract strategic investments and skilled workers. Second, a global division of labor that pushes developed States to embark on strategies aimed at enhancing creative and productivity-led work. Third, an aging population – particularly in Europe – that gradually reduces the work force. Fourth, a growing pressure on the welfare State to maintain its capacity to deliver public goods to the entire population that reinforces the need for new, creative solutions. Fifth, a transition from an economic model based on technological development to a model that focuses on changing the ways in which things are made and their impact on social development. Sixth, the growth of cultural industries and their increasing influence in global interactions. Seventh, the rise of bio-industries in fields such as genetic engineering or biotechnology. Eight, the gradual concentration of expertise and innovation in a limited number of regional and urban hubs. Ninth, the aggravation of the global divide between the rich and the poor and, as a result, the aggravation of inequality and marginalization. Tenth, the generalization of a "culture of emergency" that puts emphasis on the instability of the job market and the complex sustainability of the Global Information Society both in environmental and human terms (Himanen 2004).

A second, less frequent definition of the Global Information Society characterizes it as a political project to materialize an ideal that does not exist yet and that builds on an Information Society that is neither universal nor symmetrical. This definition is partially built on the difficulties to fully implement the society described in the previous paragraphs, as well as on the uncertainties surrounding the several policies, regulatory and governance choices it allows (Castells and Cardoso 2005). The articulation of political projects linked to the construction of a Global Information Society began in the mid- and late 1990s (Marsden 2000). Some examples of this trend can be found in several policy statements by the Organization for Economic Co-operation and Development (OECD, 1997) and the 1998–1999 annual report of the World Bank (1999). However, the more developed political projects are those led by the United Nations at the global level and the European Union at the regional one.

With regards to the former, the first step of the organization was the report elaborated by the Commission on Science and Technology for Development in the late 1990s (Mansell and Wehn 1998). The turning point arrived 3 years later with the approval of the United Nations General Assembly Resolution 56/183 in 2001. This decision endorsed the World Summit on the Information Society (WSIS), an initiative that developed in two consecutive phases. The first one focused on the need to build a strong political will to build a truly Global Information Society and the importance to acknowledge differences between States in designing ulterior strategies. The meetings brought together more than 11,000 participants in December 2003 and ended up with the adoption of the Geneva Declaration on Principles and the Geneva Plan of Action. The second phase paid special attention to Internet governance and financial mechanisms. With more than 19,000 participants, the meetings celebrated in November of 2005 led to the approval of the Tunis Commitment and the Tunis Agenda for the Information Society. The implementation and follow-up of these agreements is carried out by a plethora of different fora and mechanisms such as the United Nations Group on the Information Society, the Internet Governance Forum or the WSIS annual forum.

The political project launched by the European Union in the mid-1990s is the most elaborated one to date. Following some previous works of the

European Commission and several initiatives adopted by the United States and some Member States at the domestic level, the European Council asked a group of experts to reflect on the Information Society in 1993. The result of this process was the publication of the so-called Bangemann report in 1994 (EC Commission 1994). This paved the road for the creation of the Information Society Project Office and the Information Society Forum in 1995. One year later the European Commission approved a green book emphasizing the need to place citizens first in the construction of the Global Information Society. In line with this initiative, the European Council adopted the Information Society program in 1998 with three main goals: to improve the level of social awareness and understanding of the potential implications of the Information Society, as well as its new applications across Europe; to optimize the socio-economic benefits of this society at the European level; and to emphasize both the role and visibility of Europe as one of the main promoters of the Information Society at the global level. This document informed the *e*Europe initiative launched by the European Commission in 2000, the basis for the several action plans and strategic framework elaborated since then. These include the action plan *e*Europe 2005 and the strategic framework i2010. The former emphasizes the need to build an inclusive information society. Building on this idea, the latter seeks to maximize three main goals: the construction of a Single European Space capable of offering safe and affordable connections, digital services, and diverse quality contents; the promotion of innovation and investment efforts in information and communication technologies; and the gradual advance of a European Information Society aimed at fostering inclusion, good public services, and high living standards.

## Synonyms

Cosmopolitanism; Ethical toolkit; Obligation; Stoicism; Universalism versus contextualism

## Definition

Global justice is a theoretical stand that addresses the issue of just distribution of benefits and burdens across the world and looks at the viability of the institutions required to secure such a just distribution.

## Introduction

Global justice is a theoretical stand that addresses the issue of "just distribution of benefits and burdens across the world" and also looks at the viability of the institutions required to "secure such a just distribution" (Kukathas 2006: 1). The basis of cosmopolitan global justice lies in the consideration of individual human beings as the primary object of concern wherein the territorial boundaries does not imply any constraint on the deliverance of justice. The idea of global justice is rooted in the theory of cosmopolitanism, which is defined as a moral ideal that emphasizes tolerance towards differences and envisages the possibility of a more just world order. Cosmopolitan theory holds that our obligations to distribute resources to others do not halt at state borders (Cabrera 2004: 1). Obligation remains as important issue, while the goals and ideals inherent in cosmopolitan global justice remain the central concern, the demands of global justice become more pronounced once obligation is brought to the fore (Pogge 2001: 3). The idea is that the duties of human being towards fellow human beings should not be limited to compatriots. Equal moral worth of individuals irrespective of their citizenship remains the central concern.

### Precursors of Global Justice

Stoic philosophy could be seen as precursor to liberal thought in general and cosmopolitanism in particular. The central idea that grounds the Stoic philosophy is that one human being should not be thought to be "alien" from another (Cicero 1887: III/63). The Stoic notion is rooted in the premise that one needs to be "a citizen of the world" (Aurelius 2006: 195; Nussbaum 2002; Sherman 2005). The notion is idealistic in that it does not take into consideration the tension between moral universalism and contextualism. Immanuel Kant (2002, 2006) remained occupied with the issue of equal moral worth of individuals. For the sake of establishing "perpetual peace," Kant's "federation of states" is seen as a "bond of mutual non-aggression" where the free-federation must be confined to the repudiation of war-like or war-making acts against each other. This clearly appears more as a statist view than cosmopolitan. Locating similar statist tendencies in Kant, Hurrell (1990) also locates strong cosmopolitan tendencies in his thought. He identifies this in Kant's acknowledgement of the fact that "rights and obligations bound all individuals as individuals and not as citizens of particular states" (Hurrell 1990: 205). Furthermore, Hurrell (1990) highlights the relevance of Kant's work by the validity of his prediction about the obligations of a cosmopolitan morality being ever more

important looking at the destructiveness involved in wars. Kant is primarily concerned about the progress, freedom, and well-being of the individual (Kant 2006: 21). Thus, for Hurrell (1990), it is difficult to categorize Kant as either purely statist or as purely cosmopolitan. In contemporary literature, liberal cosmopolitans have integrated the issue of war and sovereignty with that of global justice. They also show a Kantian influence insofar that they emphasize the idea of equal moral worth of human beings.

### Contemporary Scholarly Contributions

Thomas Pogge (1992) has taken cue from the political theory of liberalism and show an inclination towards Rawlsian account wherein he emphasizes the need for application of the principles of justice, as endorsed by Rawls (1971), to the global level. Charles Beitz (1979) similarly puts forward a cosmopolitan defense of international distributive justice, arguing that John Rawls's justification of the difference principle in his earlier work applies to international realm with minimal modifications. Even Rawls himself modified his theory of justice in a later work to be suitable to the international domain. He advocated a "particular political conception of right and justice that applies to the principles and norms of international law and practice" (Rawls 1993: 36). Beitz further questions the moral skepticism of the realists who argue against treating international relations as a subject of normative political theory. He challenges the realist notion that states possess valid moral claims against intervention. For him, such notion is a result of a faulty analogy between states in the international system and individuals in domestic society. Beitz argues that any immunity enjoyed by states is contingent on the justice of their domestic political arrangements (Beitz 1979).

A major contribution of Rawls is the idea of "Society of People" which is an international community of all people following the "Laws of People" and stipulates the maintenance of "mutual respect among people" (Rawls 1993: 49). The idea seems rhetorical to the extent that it is not clear what an "original position" would entail for the international community.

### Different Strands of Global Justice

The adherents of multiple strands within the broader theory of cosmopolitanism share three basic elements:

1. Individualism: Implying that the ultimate units of concern are human beings or persons rather than any other communal or national identity.
2. Universality: Positing the notion that human beings as ultimate unit applies to all equally irrespective of other differences. A white man is equal, say, to a black woman.
3. Generality: Meaning that persons are ultimate units of concern for everyone and not just for fellow compatriots or fellow religionists. (Pogge 1992: 48–49).

Other than these common principles, there are some broad distinctions among various theories of cosmopolitanism.

1. **Moral versus institutional cosmopolitanism**
   Moral cosmopolitanism posits that every person holds a "global stature" and thereby could be understood as the ultimate unit of moral concern. He/she is entitled to equal consideration irrespective of his/her "citizenship or nationality" (Brock 2009: 11). The institutional cosmopolitans argue for the need of drastic "institutional changes in the global system" in order to realize the cosmopolitan vision adequately (Brock 2009: 12).
2. **Extreme versus moderate cosmopolitanism**
   The extreme cosmopolitans are strict in terms of the "source of value" and argue that all other principles of morality must be justified "with respect to cosmopolitan values." Moderate cosmopolitans take a more pluralistic line on the source of value and posit that even some non-cosmopolitan values may have "ultimate moral worth" (Brock 2009: 13).
3. **Weak versus strong cosmopolitanism**
   Weak cosmopolitans are fine with only the basic conditions being universally necessary for human beings to lead "minimally decent lives" (Brock 2009: 13). The strong cosmopolitans, however, argue for a more "demanding form of global distributive equality" aiming at

the elimination of inequalities beyond the point of leading a "minimally decent life" (Brock 2009: 13).

4. **Interactional and institutional cosmopolitanism**
   These two variants relate to the issue of responsibility of deliverance of justice. While the interactional cosmopolitanism assigns direct responsibility for fulfilment of human rights to other agents, institutional cosmopolitanism assigns such responsibility to institutional schemes. On the interactional view, human rights impose constraints on conduct, while on the institutional view they impose constraints upon shared practices (Pogge 1992). The interactional variant of cosmopolitanism is more close to the notion of inclusive justice. The mode is close to methodological individualism wherein the individuals are at the center of concern (Weber 1968).

## Alternate Visions of Global Justice

Away from such Anglo-Saxon conceptions of global justice, there have been multiple interventions and conceptualization of the ideal.

### Religious and Non-Western Traditions

Several religions contain and profess a "range of ideas and practices" conducive to the pursuit of global justice (Wilson 2010: 737). The central point of convergence between different religion traditions is their focus on the "human being and their lived experiences" (Wilson 2010: 737). The Jewish, Christian, and Muslim traditions focus on the relationship of the human being to God, thereby elevating the human experience as sacred. Various strands within Hinduism as well seek a non-dualistic notion which emphasizes a connection between the creator and the creation, thereby elevating each to a respectable position. This is reflected in the Advaita philosophy of Vedanta that focussed on this intrinsic connection and had its roots in the ancient Indian texts (Pande 1993: 3).

Hinduism highlights the negative duty of cosmopolitanism: individuals should not cause unnecessary suffering to other living beings. Related are the traditions of Jainism and Buddhism that advocate "ahimsa" – or nonviolence that prescribes a similar negative duty for individuals (Peetush 2011: 23–25). Mohandas Gandhi, the Indian leader, further talked on similar lines and emphasized the idea of "sameness" of individuals (Snow 2011: 377). Use of pacifism and resistance to apartheid were some embodiments of his ideals.

Ancient Indian texts embodied the idea of "Vasudhaiva Kutumbakam" meaning that the world is one family. Rabindranath Tagore reformulated this into the idea of 'the world as one nest" indicative of the development of intimate relationship between the various cultures of the world (Jelnikar 2011: 1054). His focus remained on practicing this cosmopolitan ideal through breaking away from religious bias and caste prejudices. His philosophy of education further sought to bring together the lives of diverse individuals, thereby creating a new sense of solidarity that did not marginalize anyone (Jelnikar 2011: 1054).

Chinese intellectual tradition of Confucianism focused on "human heartedness, humane love, and benevolence" (Seok 2011: 593). It remains relevant to the present context by arguing about an "intrinsically social and relational nature of human existence" (Seok 2011: 595).

African philosopher Henry Odera Oruka conceptualized global justice "as equal distribution" of the wealth of the world and the removal of all inequalities (Oruka 1997: 118). He focuses on a "certain minimum amount of physical security, health care, and subsistence" for all individuals (Oruka 1989: 469). This definition was provided in the late 1970s and early 1980s, and it appears more in lines with what Thomas Pogge conceptualized a decade later.

## The Problems With Global Justice

Though global justice is theoretically sound, it lacks practical applicability in a true altruistic sense. The notion that territorial boundaries do not matter in deliverance of justice presumes a

"post-political" setting (Mouffe 2005: 1). In this regard, scholars have asserted that owing to the advent of liberalization and globalization, boundaries have started to lose its traditionally held meaning. The reality, however, suggest otherwise. The prioritization of liberal-capitalist model as the only viable and desirable model defies the process of nation building itself and thereby aggravates the process of further exclusion. In this regard, recent instances have testified that even though the claims of the adherents of global justice are altruistic, the practice confirm that the motives are based on narrow self-interest.

### Thin Moral Universalism Versus Thick Contextualism

Applicability of universal norms and ideals remain a contested domain. Michael Walzer, propounding a communitarian point of view, brought out the distinction between 'thin universalism and thick particularism" (Walzer 1994: 50). The idea of global justice fails to uncover the inherent hegemonic tendencies where a certain worldview is considered as optimal, while the alternate competing worldviews are not considered worthy of serious consideration and thereby relegated to the margins. On the other hand, a contextualist stand by definition would defeat the very notion of global justice. Kukathas is opposed to any imposed notion of justice and instead argues for having "a commitment to mutual toleration" (Kukathas 2006: 3). Such understanding is favorable insofar that it reduces the possibility of exclusion and imposition. This follows from the idea that justice has to be considered context specific and relative. However, there remains the problem as to how the ideal situation of justice be conveyed in the absence of any ground rules. Further, when common ground is taken, it leads to the exclusion of marginalized sections – deliberately or inadvertently – that have differing notion of justice.

The debate between universalism and contextualism was a matter of debate within the English School that saw disagreements between the so-called solidarist and pluralist camps. The underlying notion is that the solidarists claimed universal norms as the ground principle, while the pluralists stood in favor of respecting and accepting differences. The debate between the liberals and the communitarians also hints at the distinction between universalism and particularism. In this regard, it is important to outline the exclusion created by universalizing certain norms and values to a degree that runs counter to the very idea of global justice. The general prescription of theorists of global justice conveys the idea that redistribution of wealth is what matters the most. This might appear very altruistic in short term but is detrimental to human progress over time. Merely arguing for structural readjustment at global economic level does not translate to reality when the powerful are reluctant to change the status-quo. Also, even when the status-quo is altered, the benevolence of the power wielders would not create any positive outcome in terms of uplifting the marginalized.

### The Ethical Toolkit in Pursuit of Global Justice

Analyzing the major theoretical contributions towards the idea of global justice, it is apparent that there are hegemonizing tendencies inherent in majority of the literature. It is desirable to locate an ethical toolkit that would allow deliverance of justice at its face value. In this regard, Pogge's work is a major value addition. He focuses on an ethical toolkit that is motivated by the belief that the negative and intermediate moral duties are more stringent than positive ones. For example, the duty not to kill innocent non-combatants is more stringent than the duty to prevent such an assault by others. Pogge's emphasis on a "maximalist conception of rights" holds that rights entail both negative and positive duties, i.e., duties both to refrain from harming others as well as duties to protect and to assist others whose rights are subject to being violated (Pogge 2008: 72). Pogge's toolkit fails owing to the fact that the actions taken by states in the name of delivering positive duty can easily allow them to undertake actions on pure, non-altruistic nature and serve their narrow self-interests. The façade of justice further allows the covering up of any violation of human rights in the name of deliverance of greater good (Pogge 2010). Charting out policy measures to tackle the demands of global justice are under

process and there has been substantive progress in generating a general understanding about issues of global poverty, widespread hunger, healthcare, and other poverty-related avoidable circumstances. Thomas Pogge's elaborate ideas about developing a Health Impact Fund and Global Resources Dividend in order to restructure the international institutional order in a more democratic way does reflect a Kantian model. He argues in favor of a radical, yet feasible, transformation of the prevailing international basic structure. The gap between what is commonly acknowledged as requirements of morality and the actual conduct of citizens of the rich and wealthy countries must be bridged and he confronts these moral requirements with a vast collection of empirical data concerning the massive under-fulfilment of basic social and economic rights worldwide (Pogge 2010).

Amartya Sen presents another toolkit by arguing that not all ethical commitments and obligations are mediated through relations between nations. Thus, he focuses on a truly "global" sense of justice that breaks away from contractarian position and views justice across borders not merely as international justice (Sen 2002: 48).

## Realizing Global Justice

The above discussions examined the theoretical content and the normative contestations in the idea of global justice. One question remains: can global justice be realized or should one discard it as either utopian/rhetorical or as hegemonic? The notions elaborated above remain confined to the domain of ideas and lack practical applicability. There are underlying problems with the over-simplified arguments of philosophers and theorists of global justice.

### A Rhetorical Claim?

Arguments of Cicero and Kant examined in the beginning reflect a rhetoric. A question begs attention: How should one go about it? It seems very commonsensical to argue that each human being has equal moral worth and people should respect each other. However, the problem remains with the issue of national and strategic interest of states. If a so-called democratic state, like India, cannot guarantee basic social and economic justice to its own nationals, global justice seems mere utopia.

### A Hegemonic Enterprise

Even though the theories of cosmopolitanism seeks to transcend the statist bias by arguing for duties and responsibilities beyond borders, their tendency to universalize norms becomes a tool for perpetuating the project of modernity. Thus, though the idea of global justice is appealing, its application remains exclusionary (Choudhary 2018: 31–32). The instances of selective intervention and the idea of sovereignty as responsibility is based on a "standard of civilization" argument that seeks to universalize norms relating to a particular conception of liberal democratic political order (Ayoob 2002: 84). The smokescreen of justice serves to legitimate the narrow self-interest of a few powerful countries (Choudhary 2016: 19).

### A Global Policy

It would be merely utopian to think and talk about global justice without having a global policy for implementing the desirable. The issues concerning global justice seem limited to the level of theorization without having appeal for the need of a global policy. The basic problem in having a consensually agreed policy is that the diverse societies differ foundationally in their cultural, economic, political, and psychological factors. Simon Caney favors the "Sen-Nussbaum metric" insofar that the global equality of opportunity requires that persons (of equal ability and motivation) have equal opportunity to attain an equal number of positions of a "commensurate standard of living" (Caney 2003:128–132). Amartya Sen's idea of 'Standard of Living" is in terms of people's capacity to enjoy certain functionings. Capability is a "set of vectors of functionings" that reflect the "person's freedom to live one type of life or another" (Sen 1995: 40). The various functionings achieved by a person are "potentially all relevant" to the evaluation of that person's living standard (Sen 1985: 39).

## Conclusion

A discussion on global justice ought to resolve the basic line of disagreement that exists between universalism and contextualism. While the general understanding is that one is the only alternative to the other, a better way to reconcile the two would be to acknowledge the presence of plural identities and various institutions that are partly responsible and partly obliged to the deliverance of global justice (Sen 2002). The ideal of global justice remains a sought after enterprise: the changing global context witnessing the fluidity of persons, ideas, norms, and knowledge clearly necessitates a greater engagement with it. The hegemonic tendency to universalize norms that are essentially Western remains a major roadblock. In this regard, a clearer conceptualization of global justice, beyond its redistributive and contractarian aspects, is crucial.

## Global Performance Measures

Henrik P. Minassians[1] and Suren Ghazaryan[2]
[1]California State University Northridge, Northridge, CA, USA
[2]Burbank, CA, USA

Performance ideas have been around for hundreds of years. Scholars of performance measures and management have traced the origins of the movement beyond the New Public Management. Analyses of the early twentieth century in New York reveal similarities with contemporary practices. There are eight performance management movements that can be clustered into three time segments. They are: (a) the pre-World War II era; (b) the period from the 1950s to the 1970s, which coincides with the rise of the welfare state and the growth of governmental programs; and (c) the 1980s onward with a rise of new public management initiatives challenging the role of government. However, there should be a distinction between policy movements, which focus mainly on the outcomes of organizations and public program, and management movements that have more internal focus on outputs and efficiency. Nevertheless, there remain elements of outcome measures within the management movement, raised mainly due to a misunderstanding of the differences between what constitutes output and outcomes. In implementation of performance management principles, many public officials treat outputs as outcomes.

### The Era of 1900 Until World War II

The three performance movements associated with this era are the social survey movements, Taylor's scientific management movement, and the cost accounting movement. All these movements were partly reactions to the industrial revolution. Social survey movements were a reaction to the social context of industrialization and how local governments were plagued with patronage while factory workers lived in poverty. The performance movements associated with this era aimed at answering societal issues through rationalization and quantification of administration processes in order to increase efficiency and fairness of operations.

The purpose of the social survey movement was to address social ills and identify the causes and facts surrounding the plight of urban life. The best-known work of the social survey movement is associated with Charles Booth's study of Life and Labor of the People of London (1886–1903) (Linsley and Linsley 1993). Booth attempted to develop a better understanding of the number of people living in poverty, why they were poor, and how to design a remedy. Ultimately, the issue was not just to collect data but also to use the information to develop policy solutions. While the social survey movement targeted mainly social inequalities, the idea behind the scientific management movement was infrastructure to address issues related to industrialization. The purpose of the scientific management movement in government was to address ineffectiveness of public organizations particularly in the development of large infrastructure projects such as public works projects. It was believed that the application of

Taylorian and Weberian principles would improve governmental activities and processes, thereby making administration of public affairs a profession based on scientific principles.

The last movement within this era was the development of cost accounting, the examination of the systematic recording and analysis of the costs of material, labor, and overhead incidental to production in order achieve efficiencies. Through the use of output indicators, organizations can assess the financial cost of their activities. Schachter (1989) and Stivers (2000) suggest that the New York Bureau of Municipal Research (NYBMR) was one of the first organizations to synthesize all three activities. The cost of applying these rational and scientific methods created depersonalized management policies, many of which were taken national resulting in the creation of organizations such as the General Accounting Office. At the international scene, such an example of this is a study by Paul Devinat in 1927 (Merkel 1980), for the International Labour Office in Geneva, an extension of the work done by the New York Bureau of Municipal Research.

## Post-World War II Era to the 1970s

A second generation of performance measurement came out of World War II with focus on budgetary issues. Initiation of the Hoover Commission in the United States can be seen as an effort to examine the growth of the federal government during the 20 years leading to the 1970s. The aim of Hoover Commission was to improve the budgetary process in terms of work done instead of identifying expenditures (Shafritz and Hyde 2004). During the 1960s, performance budgeting became a well-established initiative in the form of Planning, Programming, and Budgeting Systems (PPBS). This form of budgeting and planning examined the marginal benefit of each program. Some associate this form of performance budgeting with Robert McNamara in that he stressed system analysis as an aid in the decision-making process. Great Britain introduced performance budgeting in their defense ministry in the 1960s and extended it to other departments. The French used similar performance budgeting practices called RCB (rationalization des choix budgetaires). By the early 1970s, performance budgeting in the form of PPBS became an integral part of economic planning in Australia, Austria, Belgium, Canada, Ireland, and Japan (Novick 1973).

However, the consensus is that PPBS did not achieve what it promised to do nor did subsequent initiatives such as management by objective (MBO) and zero-based budgeting. One main emphasis of PPBS is its mark on the creation of systems thinking as a managerial tool. That approach, however, could be associated with its failure. Aaron Wildavsky (2009), one of PPBS's critics, suggested that focus on program structure is harmful in that the budgetary process is a political and not a rational process. The main challenge with PPBS was its inability to create a causality scheme between departments and activities.

Beyond performance budgeting, other movements came about with a focus on social indicators. Some associated the rise of the social indicator movement to the emergence and expansion of the welfare state and government's willingness to provide a safety net in the form of social programs. One of the direct effects of the social indicator movement was the creation of statistical modeling that enabled public sector officials and programs to project outcomes into the future. The aim of the social indicator movement was to conjugate data measuring various social variables such as health, crime, housing, etc. The social indicator movement had profound impact on government operations and the use of statistical apparatus to explain social phenomenon. However, the economic crisis of the1970s brought about with the Arab oil embargo shifted the role that government played in social indicator practices; the focus then was to cut back governmental programs. One can associate the rise of performance management initiatives of later decades to the ability of quantifying various indicators to measure outputs and, possibly, outcomes when it came to the public sector activities.

## From the 1980s to Today

The 1980s represent the start of retrenchment of government and its role in managing the welfare state. Some associate the rise of this retrenchment to the branch of economics called public choice where analysis of people's actions in the marketplace applies in decision-making at the individual and collective levels. Terry Moe (1984) in his classic work *New Economics of Organization* depicted the game that individuals play in the organization in order to shirk from their responsibilities, thus creating a moral hazard. These types of arguments seeped into politicians' perception of the role of state and bureaucracies and have given the ascent to new right ideologies notably in Australia, the United Kingdom, and New Zealand with new experimentations in managerial practices.

In the 1980s, tax breaks and fiscal savings became the prime focus. In the United States, under the Ronald Reagan administration, the appointment of the Grace Commission was an attempt to identify areas in which the federal government could assume savings. One strategy was reducing the number of federal employees by contracting out the delivery of services. Milward and Provan (2000) associates this move as hollowing out of state where government sees reduction of public workforce and greater reliance on markets in the form of contracting for achieving assumed savings. Performance measurement, for example, became a leading initiative in the United Kingdom with the launch of Financial Management in 1982, which focused on objectives and measuring outputs. Pollitt (1993) suggests that use of performance indicators became the main approach in measuring outputs of public organizations and programs.

This type of managerialism in the 1980s gave rise to a global movement called New Public Management (NPM). The goal of New Public Management was to adopt private sector principles and practices in the management of welfare state programs. Hood (1991) associates NPM to the performance movement of the earlier eras. The use of performance information became the core idea for decision-making and improvement of public organizations. Performance measures and the information generated were utilized for financial, contractual, and even human resource management purposes. During this era, performance budgeting sneaked back into the stage of performance measurement mainly used by politicians as a planning and evaluation tool. In the United States, the Government Performance and Results Act (GPRA) utilized performance budgeting as a lever.

The 1990s saw the rise of performance as the main issue in public sector organizations around the world. William Thomson (1891), a Scottish physicist, in a lecture titled "Electrical Units Measurement" stated, "I often say that when you can measure what you are speaking about, and express it in numbers, you know something about it; but when you cannot express it in numbers, your knowledge is of a meagre and unsatisfactory kind; it may be the beginning of knowledge, but you have scarcely, in your thoughts, advanced to the stage of science, whatever the matter may be." Others such as Peter Drucker or Edwards Deming have also suggested what gets measured gets done. Here we see a shift from New Public Management language and perspective to performance management.

In more recent years, we have seen the rise of a new movement, evidence-based policy (EBP). EBP fits well within the context of measuring program outcomes. The main tenet of EBP is to measure outcomes rather than opinions when it comes to policy decisions. Solesbury (2001) is associated with the start of EBP in the medical and public health sectors. However, by the end of the 1990s, EBP had spread across all sectors. EBP focuses on the social indicator movement similar to some of the promises of social engineering in the earlier era. The challenge with performance measures such as EBP is that it assumes policy decisions are mainly based on objective facts and data instead of politics. Political conflict is how decisions are made, and in Minassians and Roy's (2017) finding, data and facts are used only 30% during times of crisis. Also, part of the problem remains as to how the facts and data are used and whether that information is used selectively for fulfilling political goals rather than objective policy decisions.

Since 2010, a number of countries have been reviewing and revising their performance systems. The global fiscal crisis in particular has returned the focus to public financial management in many countries. Public financial management aims to achieve three goals: maintaining a sustainable fiscal position, allocation of resources, and delivery of effective and efficient public goods and services. This suggests a shift away from program effectiveness to fiscal sustainability and organizational efficiencies. The recent IMF publications noted that nearly all OECD countries have developed performance information along with the integration of accountability and financial management. In recent years, we have witnessed various experimentations among local government agencies. Some localities such as the City of Baltimore or the County of Ventura have developed informative performance measures for the purpose of linking citizens with what their government does. On the other hand, we have seen other localities that use performance measures for political ends.

## Politics Is and Will Remain Part of Performance Movement

Depending on how and for what purpose performance measures are used, there always remains an element of power dimension. Executive and legislative branches use performance movements for budgetary purposes and decision-making particularly during crisis. Therefore, what gets collected and how the performance goals and indicators are initiated and used will dictate the relevance and usability of them. The early attempts of separating politics from administration can be seen as a political act empowering the administrative apparatus. On the other hand, use of performance budgeting can be associated with attempt for control of the legislative and executive branches of public bureaucracies. The main challenge and barrier is the design and implementation of performance measures. In general, any movement associated with this is the rise of a networked environment where multiple partnerships determine the outcome of a policy. Public sector organizations are no longer directly in charge of determining the outcome of programs. Rather, we see an era where multiple public-public, public-private, public-nonprofit, and citizen, voluntary and community, groups interact for the coproduction of outputs and outcomes. The value in outcome is no longer purely public, but it has become murky, while public agencies are still held and perceived as the accountable parties.

## Conclusion

Even though performance movements, at times, have been seen as a fad, they remained part of public organizations over a century. Various movements have come and gone or morphed into new movements, but they all have left elements of residue behind shaping public organizations. We see this with the integration of various performance measures or practices into the processes of public sector organizations. From the use of quantitative analyses to various fiscal policies, we see inclusiveness of these movements within government. As outlined in this entry, various movements came about to address challenges for that era but still remained influential during later periods.

## Global Poverty and Inequality

Steven Slaughter
School of Humanities and Social Sciences, Deakin University, Burwood, VIC, Australia

### Introduction

The combined impact of global poverty and inequality is one of the most significant moral and political issues in global politics. While contemporary levels of global poverty are improving in overall terms, they still lead to the death of many vulnerable people around the world from poverty-related causes of starvation, malnutrition, or disease. Coupled with global poverty are wide and growing forms of inequality within and between societies around the world. Consequently, global poverty and its consequences of insecurity, despair, and powerlessness have become contentious issues as demonstrated by the activism of civil society organizations (CSOs), the policies of international governmental organizations (IGOs) such as the United Nations (UN), and the continual pressure of less developed countries (LDCs) that possess the bulk of the global poor. This entry examines the scale and nature of contemporary global poverty and inequality, outlines the drivers of these forms of poverty and inequality, and considers the main policy measures that have been arranged to promote development and address global poverty.

### The Scale of Global Poverty and Inequality

Before global poverty is analyzed, it is important to consider the idea of socioeconomic "development" and, more importantly, the contested nature of this term. While the term development has various intellectual origins, the modern conception of development really only emerged in the postwar era as the colonial powers left or were expelled from their former colonies. Most definitions of development focus upon improvements in economic well-being and the measurements of a given nation's material prosperity. From this perspective, development is interpreted through an economic prism as an improvement in the economic productivity and material well-being of a country's inhabitants in terms of economic growth. Material well-being, and development, can therefore be measured in purely quantitative terms by calculating a nation's gross domestic product (GDP) or gross national income (GNI) divided by its population to define overall average or per capita incomes. The World Bank also determines the number of people with personal incomes below the US $1.90 per day threshold for extreme poverty (The World Bank Overview 2017). Many in the economics profession continue to view development in such terms – and with good reason given that GDP is a good measure of the welfare of nation – but it certainly does not capture all the characteristics of social life which constitute a population's well-being.

Consequently, since the early 1990s, there has been a shift away from purely quantitative definitions to measurements which assess the broader social, cultural, and environmental aspects which define well-being. This perspective has been led by the UN (Jolly et al. 2004) and considers

development as an increase in the capacity of individuals in a given society to conduct their lives as they choose. This means that qualitative social indicators have increasingly been employed to gauge the overall "quality of life" of a people within a given state or region. The most prominent example is the UN's approach of human development and is calculated and expressed in the Human Development Index (HDI) as a number between 0 and 1, which is published annually in the United Nations Development Programme's (UNDP) *Human Development Report* which ranks countries according to their relative life expectancy, education levels, and income (United Nations Development Programme 2017). This qualitative and multidimensional view recognizes broader notions from health indicators – such as life expectancy, infant mortality rates, and HIV rates – to more socially defined measures, such as functional literacy and primary school enrolments. As such, absolute poverty is understood by the UN as "a condition characterized by severe deprivation of basic human needs, including food, safe drinking water, sanitation facilities, health, shelter, education and information" (World Summit for Social Development 1995, p. 38).

The overall picture of development and global poverty is extremely problematic despite significant progress in the last two decades. The improvement in income-based measures has been dramatic in recent decades. According to income-based measures of poverty determined by the World Bank: "in 2013, 767 million people lived on less than $1.90 a day, down from 881 million in 2012 and 1.85 billion in 1990" (The World Bank Overview 2017). This means that in 2013 that 10.7 percent of the world's population lived below the US$1.90 a day threshold, compared to 35 percent in 1990 (The World Bank Overview 2017). In qualitative terms there have also been improvements. The 2010 *Human Development Report* notes that the world average HDI increased to 0.68 in 2010 from 0.57 in 1990 and 0.48 in 1970 (United Nations Development Programme 2010, p. 26). Furthermore, all but 3 of the 135 countries measured had a higher HDI in 2010 than in 1970 (the exceptions were the Democratic Republic of the Congo, Zambia, and Zimbabwe) (United Nations Development Programme 2010, p. 27). The aggregate global measurements are strongly influenced by the sustained progress in populous countries such as China and India over the last few decades.

Global poverty remains a crucial problem despite this progress. Declines in poverty have been extremely uneven with poverty reduction dramatically less evident in sub-Saharan Africa than the significant improvements in South Asia and especially the massive improvements in South East Asia and China (The World Bank Overview 2017, p. 96). While rural poverty remains an issue for LDCs, the UN has also estimated that more than one-third of people living in cities in the developing countries (approximately 863 million people) live in slum-like conditions with inadequate housing, water supply, and sanitation (UN Habitat 2013). Furthermore, in human development terms despite improving incomes, almost 1.75 billion people in 104 developing countries are living with overlapping deprivations in health, education, and living standards (United Nations Development Programme 2010, p. 86). These deprivations lead to high levels of personal insecurity and poverty-related deaths. To put the current levels of extreme poverty in their starkest, we can look at the current levels of poverty-related deaths as one of the most staggering events in human history. As the philosopher Thomas Pogge claims "massive poverty caused by human agency is certainly not unprecedented" with British colonial institutions and policies being blamed for up to one million poverty deaths in the Irish potato famine of 1846–1849; Stalin's economic policies during 1930–1933, which caused some seven to ten million famine deaths; and Mao Zedong's "Great Leap Forward" in China during 1959–1962 which caused approximately 30 million poverty deaths (Pogge 2005, pp. 721 and 741). However, compared to contemporary global poverty, "these historical catastrophes were of more limited duration and even at their height did not reach the present and ongoing rate of 18 million poverty deaths per annum" (Pogge 2005, p. 741).

The statistics relating to global inequality are also stark and even more unrelenting with inequality rising between and within countries. In overall terms in 2014, "the richest 1 percent held 48 percent of global wealth" and "around 80 percent of the world's people have just 6 percent of global wealth" (United Nations Development Programme 2015, p. 65). Inequality between societies is increasing. The UNDP notes that the ratio of income of the world's poorest fifth compared to the richest fifth has increased from 74 to 1 in 1997, up from 60 to 1 in 1990 and 30 to 1 in 1960 (United Nations Development Programme 1997, p. 35). In 1990 the average American was 38 times wealthier than the average person from Tanzania, while in 2005 the average American was 61 times wealthier (United Nations Development Programme 2005, p. 37). Inequality within societies is also increasing in both developed and developing societies. This is evident with sharp rises in income inequality weighted toward the very rich. For example, "between 1976 and 2011 the share of total annual income received by the richest 1 percent of the population in the United States rose from 9 percent to 20 percent" (United Nations Development Programme 2015, p. 65). Inequality has wider manifestations than wealth or income, with growing differentials in HDI measurements of health and other qualitative indicators. Clearly women and vulnerable minorities are often subject to economic and social inequality and marginalization in many societies. Furthermore, divides of opportunity to access work remain which creates forecasts of intergenerational poverty persisting and therefore inequality and social immobility becoming entrenched in many societies.

As a result of poverty and inequality, many people are bearing the brunt of personal vulnerability, marginalization, and insecurity that stems from these conditions. For poor people living on less than a US $1.90 a day, poverty is not some statistical abstraction but a case of personal subjection that makes it impossible to live a full and dignified life. Indeed, it is crucial to state that there remain 795 million severely undernourished people in the world with particular impacts on women and children which leads to lasting ill health (Food and Agriculture Organization of the United Nations 2015). The important issue to consider is how these patterns of poverty and inequality have transpired.

## Drivers of Global Poverty and Inequality

There are several key interlocking drivers or factors which are often used to explain the existing forms of extreme global poverty and inequality and the separation of the world into a developed and wealthy "North" and the LDCs of the "South." However, we must be aware that there are many local political, cultural, and climatic particulars which affect development outcomes and patterns of poverty in particular states. Furthermore, in overall terms, different accounts of political economy scholarship give different weighting to the various drivers.

The first driver of global poverty is the history of colonialism. One key common feature of nearly all LDCs is that they were colonialized by outside powers. The impact of colonialism varied due to the policies of the specific colonial powers and the patterns of resistance that occurred in particular locations, but typical in these cases of colonialism were systematic forms of exploitation, the extraction of natural resources, and the subordination of the local population. In the 1950s and 1960s, processes of decolonization and self-determination meant that the goal of development had become the paramount concerns of new states. However, many if not most colonial states were locked into dependent economic roles that persisted after the colonial power formally left. These colonial states were never set up to be autonomously functioning political or economic entities and were often lacking an authentic common political culture or a robust apparatus of a state able to develop an independent strategy of economic development. This has made it hard for states to embark on a process of development that effectively addresses poverty because they are economically dependent upon certain primary production sectors – especially agriculture and mining – that are useful to formal colonial markets or other external markets. Thus colonialism can be

seen to have shifted from formal political and military subordination to economic subordination, also referred to as neocolonialism.

The result of colonialism and neocolonialism is that many LDCs have gone through periods of having a state apparatus that is weak or suffers from legitimacy problems. As such, developing states have also been beset by corruption and maladministration by local elites during and after the Cold War. The impact of corruption and poor governance on development is a significant issue. It is clear that corruption does have a bad and insidious impact on people's everyday lives in corrupt societies and frustrates development by reducing the effectiveness and legitimacy of national government and diminishing the impact of external assistance (United Nations Development Programme 2005, p. 92). Also Western governments and transnational corporations have carried part of the responsibility for the corruption in LDCs due to Western corporate interests being those that have often supplied the bribe payments. Indeed, until the 1990s, governments of Western states not only allowed these corrupt practices, but they even rewarded them with tax deductibility. The 1999 Organization for Economic Cooperation and Development (OECD) *Convention on Combating Bribery of Foreign Public Officials in International Business Transactions* has delegitimized this practice.

The second driver of global poverty is the continuation of neocolonialism evident in the current institutionalization of economic policies and practices that systematically advantage the developed world at the expense of the developing world. This institutionalization does not adequately include developing world in the current economic policymaking and international financial institutions (IFIs), such as the World Bank, International Monetary Fund (IMF), and the World Trade Organization. A key purpose of these institutions has been to provide assistance and advice to developing countries with regard to how they can participate in the global economy. However, it must be remembered that these institutions have been primarily created and financed by developed states and are therefore under the control of these developed states. These IFIs have profoundly influenced the development trajectory of many developing countries, and developing states have had little voice or input into these policies. In effect, the LDCs were born into a political-economic order with rules they have no voice in creating – most developing states were not present at the Bretton Woods conference in 1944 where the IFIs were created. The decision-making procedures of these institutions favored, and continue to favor, their western creators. Whereas the UN General Assembly was based on the principle of one nation, one vote, the influence of countries in the IMF and the World Bank are weighted according to the size of their economies, meaning that they give overwhelming influence to Western and developed states. Therefore, it could be claimed that it is difficult for these institutions to effectively address poverty when they reflect the interests and perspectives of wealthy developed states.

Consequently, the economic ideas and policies of IFIs can be seen to also reflect this bias against LDCs. In particular, the IFIs have largely followed developed world trends in international economic policy from Keynesian policies between the late 1940s and the 1970s to a more neoliberal pro-market stance since the 1980s – with the view to encouraging economic growth and capital accumulation as the only path to development. The term "Washington Consensus" refers to a consensus of US government and development economists in the 1980s that minimum government and free markets were achievable and necessary across the developing world in order to promote development. However, the rise of neo-liberalism and the Washington Consensus can be seen to have a significant impact on poverty and inequality because some neoliberal policies – in particular structural adjustment programs (SAPs) – involved lending money to developing countries on the condition of reforming their domestic economies along neoliberal, free-market lines. However, SAPs did not work to effectively promote development, and the World Bank accepted this and eventually reformed many of its policies from 1999 onward to better consider the domestic institutions needed to support development in LDCs. Structural adjustment focused

only on economic growth and did not take account of broader measures; for instance, it never included a consideration of human rights, welfare minimums, environmental protections, or the need to strengthen fundamental institutions in society to help facilitate effective capitalism. Despite the concerns of LDCs, and an increased concerns about the domestic institutions required to support capitalist development, it must be noted that neoliberals and many liberals still believe that economic growth in the long run is the best strategy to promote poverty reduction and that the best way to promote economic growth is free markets. They also believe that free trade and deregulation are the best ways to achieve the progress that we have seen in the last 30 years.

A third driver in the continuation of global poverty that connects with neocolonial arguments is the problem of continuing LDC debt. Although figures on the level of indebtedness of developing countries are generally difficult to determine, the average relative debt payment burden of LDCs is forecasted between 2011 and 2024 to increase "by between 85% and 250%" (Jubilee Debt Campaign 2014). Such high levels of debt are a crushing burden on economic fortunes and development in many of the poorest countries, and in the past debt servicing has prevented poor countries from making adequate investments in health and education. Countries such as the Philippines, El Salvador, Jamaica, and Sri Lanka spend more on debt than either health or education (Jubilee Debt Campaign 2017). While debt relief is often trumpeted by the Western leaders, it is not always matched with concrete action. The *Heavily Indebted Poor Countries'* (HIPC) initiative is the current international debt relief scheme which has helped 36 countries to the value of $75 billion since 1996 (IMF 2017). But this still falls short of what is needed to effectively help LDCs address poverty.

The fourth driver of global poverty is the problems facing the LDCs when it comes to having access to the global economy. LDCs have problems accessing lucrative developed markets in heavily protected sectors of agriculture and textile markets. This is a substantial impediment to LDC development. In the 1990s, countries belonging to the OECD provide about $1 billion a day in domestic agriculture subsidies – more than six times what they spend on official development assistance for developing countries (United Nations Development Programme 2002, p. 33). If developing countries were able to increase their market share in the developed markets, they would be able to lift some of the world's poorest workers out of poverty. Likewise the access of LDCs to foreign direct investment (FDI) is important because it can be an important stimulus for economic activity and development. Transnational corporations can invest capital in LDC business ventures, which can provide opportunities and private enterprise and jobs. However, many LDCs are still not capable of attracting such investment. FDI is unevenly spread around the developing world. For instance, in the 1990s only roughly one quarter of global FDI went to developing countries; but Asia received around 20 times more investment than sub-Saharan Africa (Annan 2000).

A fifth driver of global poverty is persistent forms of insecurity and civil conflict. The legacy of colonialism is also evident in the fact that many states around the world are colonial constructs which often have low levels of social cohesion and have been beset by civil conflicts and ethnic cleavages. These conflicts were particularly significant in the 1990s with the end of the Cold War (Collier 2007). Basically, many postcolonial states are weak or failing states. The 2005 Human Development Report claims that "there is a strong association between low human development and violent conflict" (United Nations Development Programme 2005, p. 154). Some of the evidence regarding countries recently affected or engaged in civil conflict includes 22 out of 32 countries with a low HDI ranking, 9 out of the 10 lowest HDI countries, 9 out of 10 countries with the highest infant and under-five mortality rates, and 9 out of the 18 countries that had a decline in their HDI in the 1990s (United Nations Development Programme 2005, p. 154). The 2005 Human Development Report also indicates that diseases like HIV and Malaria spread more rapidly in conflict or post-conflict societies because health and educational infrastructure is

destroyed and societies obviously put resources into military. Low-HDI countries in conflict in 2002 spent on average 3.7% of GDP on their militaries but only 2.4% on health care (United Nations Development Programme 2005, p. 160). The poverty–conflict cycle creates a trap which makes it hard for a poor country to escape and is thus a powerful issue in the persistence of extreme global poverty in many developing societies.

No one of these drivers alone can easily be seen to cause global poverty and inequality. For the catastrophic levels of extreme poverty and poverty-related deaths – most significantly in Africa – there has to be a combination of factors operating. While many of these factors have been especially evident in the 1990s and early 2000s, these factors continue to shape the incidence of global poverty. Reoccurring economic crises such as the global financial crisis (2009) and the world food price crisis (2007–2008) have ongoing social impacts which affect poor people around the world long after the crisis is considered to have concluded. Furthermore, these ongoing factors are being joined by the emerging and future impact of climate change which has the heaviest impact on the poorest and the potential to sharply reverse the development gains that have occurred (United Nations Development Programme 2007/2008). Despite these ongoing and emerging challenges, there have also been various measures created which seek to highlight and address global poverty.

## Addressing Global Poverty and Inequality

Debate continues regarding the most appropriate mechanisms by which states and IFIs, such as the World Bank or regional development banks such as the Asian Development Bank, can best lift people out of poverty. Poverty alleviation has been pursued through different and overlapping approaches. Clearly, the liberal and neoliberal strategy of free trade and economic growth as an engine of development has been the dominant paradigm. From the period from the 1970s onward, poverty alleviation has been primarily pursued by LDCs promoting economic growth via engagement with global markets and free trade. Some countries have benefitted from the system of free trade and FDI that has developed since the late 1940s by government policies which have sought to engage global markets. Despite the problems noted in the previous section, there is little doubt that access to global markets is a key means by which states, particular across Asia, have improved their development situations.

However, despite the dominance of this model, the UN and the World Bank have also acted to try to address global poverty and development through policies that promote poverty alleviation through educational and health services as well as create and improve basic infrastructure like roads, dams, and other public utilities in target countries. This is normally done through targeted assistance – in the form of grants or long-term loans. Such assistance is sometimes called "aid" or official development assistance (ODA) which can be given by one country to another in a bilateral form or delivered by international agencies such as the World Bank in a multilateral form. The effectiveness of foreign aid in promoting development and addressing global poverty is heavily debated (Sachs and Ayitte 2013). While ODA targeted at poverty alleviation can make an impact, poverty alleviation has not always been a key objective of ODA as both commercial and security objectives have also figured prominently in the delivery of ODA. Also, only six developed countries have met the target established by the UN in 1967 of 0.7% of GDP.

Some official IGOs (primarily the UN and the World Bank) have addressed the conditions that permit world poverty by targeted multilateral ODA. While the IFIs have supported and promoted economic liberalization, the UN and the World Bank now focus on poverty understood as human development and thus focus on services that support the realization of these social indicators. In particular the UN has various programs facilitating development, in partnership with governments and CSOs, and various agencies such as UNDP, United Nations Environment Programme, UN Women, and UN Children's Fund (UNICEF), for instance, that all have particular areas of

competence and responsibility. For instance, UNICEF is the lead UN organization working for the long-term survival, protection, and development of children, and its programs focus on immunization, primary health care, nutrition, and basic education. The World Food Programme is the world's largest international food aid organization for both emergency relief and the promotion of development which includes food security. Furthermore, the United Nations Human Settlements Programme (UN–Habitat) assists people living in health-threatening housing conditions. In addition to emergency humanitarian assistance, the UN also operates programs to address problems of chronic diseases such as HIV and malaria.

States and IGOs are not the only actors seeking to address global poverty. CSOs and social movements have developed various attempts to address global poverty, such as the ways the anticapitalism movement sought to identify and challenge the shortcoming of free trade orthodoxy and conventional efforts to promote development in the 1990s, and more reformist efforts of the "Make Poverty History" campaign to bring attention to the issue of global poverty and increase ODA in the 2000s. Many of these groups alongside the UN have sought to develop discourses which promote human well-being that emphasize themes of democracy, human rights, the empowerment of women, and sustainable development. Many CSOs have also been involved in the actual delivery of development assistance and humanitarian aid. The size and continued growth of the large nongovernmental organizations like Oxfam, World Vision, and Save the Children points to their significant role in addressing global poverty (Ronalds 2010). There have also been a range of new transnational actors in the promotion of development and poverty alleviation such as philanthropy organizations like the Bill and Melinda Gates Foundation and hybrid organizations comprised of governments, the private sector, and civil society, evident in the Global Fund to Fight AIDS, Tuberculosis, and Malaria (Brown 2009).

The UN has also played an increasingly prominent role with respect to global poverty. While the IFIs have had the main responsibility for crafting the rules of the global economy and are largely controlled by wealthy states, there were attempts by LDCs during the 1970s to use the UN as a forum to advance a restructuring of the global economy in favor of developing countries interests. This attempt was called the New International Economic Order and the G77, which ultimately was not embraced by Western countries and the attempt dissipated. Since the 1990s the UN has attempted to engage more deeply with economic issues and proposed norms and standards for the global economy. The UN also plays a role in highlighting poverty as an important global problem and the need to articulate normative standards in relation to development in the form of socioeconomic human rights and other declarations. After all, the UN asserted the importance of addressing poverty in the UN Charter when it declared "WE THE PEOPLES OF THE UNITED NATIONS DETERMINED . . . to promote social progress and better standards of life in larger freedom" (UN Charter 1945) and reemphasized the importance via the development of socioeconomic human rights in the 1960s. More recently the UN's engagement with the issue of global poverty was highlighted in the *Millennium Declaration* in 2000 and the resulting Millennium Development Goals (MDGs).

The current normative standard is the Sustainable Development Goals which entail 17 Sustainable Development Goals (SDGs) established in 2016. These goals follow on from the MDGs, and both are overarching sets of goals for establishing development (Fakudu-Parr 2004; Fukuda-Parr and Hulme 2011). The turn of the century was a symbolic moment for the 189 Member States of the United Nations to articulate and affirm an animating vision for the organization in the form of the *Millennium Declaration* which stated "while globalization offers great opportunities, at present its benefits are very unevenly shared, while its costs are unevenly distributed" (United Nations, United Nations Millennium Declaration 2000). In 2000 the UN general assembly established eight goals (and clear targets for each goal) that were to be achieved by 2015. These goals reflected a human development

conception of development and, most importantly, were established to be a common standard for both the UN and the IFIs (Fakudu-Parr 2004). While not all of the goals were realized in the 15-year timeframe established by the MDGs, they were successful in generating unprecedented political support for human development and a shift away from only focusing on economic growth measures, having been agreed upon by every UN member state with the active support of global civil society. This means that the normative standard articulated by the SDGs/MDGs has significant purchase in discussions relating to global poverty – even with respect to states that do not support them enthusiastically.

For these reasons there was considerable support to continue on the MDG beyond the 2015 target in the form of the expanded SDGs. However, the international community did fall short in achieving the MDGs. The level of ODA has also not risen fast enough to support the development goals. Furthermore, the MDGs and SDGs have not addressed deeper questions of power given the political assumptions about development driving goals (Weber 2015) and that LDCs have not been included in decision-making processes more than what was previously the case. CSOs are quick to note that efforts to promote significant debt relief have been minimal and efforts to include the perspectives of LDCs in the structures of the global economy have been fairly modest. These development goals have not rewritten the rules of the global economy – the same underlying structures and problems prevail. The failure of the WTO to liberalize agriculture or the IMF to substantially reduce LDC debt, for example, remain as crucial problems facing efforts to promote development in LDCs.

There are differences in opinion as to how we can assess the SDGs and the preceding MDGs in addressing global poverty. Some would see free markets and global capitalism as being the keys to promoting development, and the SDGs/MDGs being peripheral to the drive of economic growth enabled by global capitalism. It must be mentioned that many free market economists still believe that economic growth is the best strategy to promote poverty reduction in the long run and the best way to promote economic growth is economic globalization and free markets and thereby continue the progress that we have seen in the last three or four decades. There are also some CSOs and governments which see the SDGs are being a crucial way to couple global capitalism with a social conscience which will address global poverty. They accept the core aspects of the prevailing global order coupled with the full and quick implementation of the SDGs by appropriately supporting these goals. In this context the role of scholarly critics and CSOs who want to put public pressure on governments and public attitudes relating to global poverty are extremely important. But there is also the position that the SDGs and the MDGs are insufficient. Thomas Pogge makes the argument that we need something more dramatic than the MDGs. He goes so far, to say in referencing the first goal of MDGs to halve the proportion of people being hungry, that we should imagine what somebody would have said in 1994 that we had plan to halve those dying in the genocide in Rwanda. He asks why should we treat deaths by poverty different from other acts of harm? (Pogge 2004). Pogge notes the contradictions between human rights set out in the Universal Declaration of Human Rights (that everyone should have access to food, water shelter) and the MDGs (the goal is only to half the proportion of poor who are extremely poor or starving). According to Pogge, human rights should be put at the center of the global economy so that the global poor's interests are considered and enforced in a more significant and sustained manner.

## Conclusion

Clearly it is easy to be skeptical about the past success of the MDGs and future of the SDGs, but they have created a common framework and standard by which global poverty is being addressed by the UN, the IFIs, and CSOs and states around the world. Yet despite the shortcoming of such standards for development, they are indications

that world leaders are aware that the combined impact of global poverty and inequality is not only an economic problem but a political and ethical problem as well. Ultimately, addressing global poverty is crucial to supporting the legitimacy of the current system of global capitalism.

# Global Public Goods

Caterina García-Segura and Pablo Pareja-Alcaraz
Pompeu Fabra University, Barcelona, Spain

Global Public Goods constitute a particular type of public goods characterized by three main features: nonrivalry consumption, nonexcludability, and international scope. First, they can be simultaneously consumed by several actors who maintain a nonrival relationship: the consumption levels of one actor do not necessarily constrain the consumption levels of others. This situation is clearly exemplified in the relationship individuals have with street lighting, the light provided by a lighthouse, or national security. Second, the benefits attached to the consumption of these goods are not limited to those who provide them or pay for them. This nonexcludability can be easily observed in the examples mentioned before, but also in the consumption of nonpolluted air resulting from environmental strategies or open access to Internet. Third, this type of goods should benefit at least a number of different States and should not discriminate

against any country, population, or generation (either present or future). This is the case of universal justice or international security. The first two features distinguish public goods from private ones that are provided by the market and whose consumption is both rival and exclusive to those who pay for them. The last condition separates Global Public Goods from Public Goods: whereas the former have an international scope, the latter are restricted to a smaller geographic area.

The notion of Global Public Goods gained academic attention in the late 1990s of the past century with the publication in 1999 of the seminal work of Inge Kaul, Isabelle Grinberg, and Marc Stern. This work was inspired by the economic theory of national public goods advanced by Paul Samuelson in 1954 and was mostly developed within the United Nations Development Program (UNDP). In essence, it urged for the adoption of this new term in order to successfully cope with the global challenges of the twenty-first century (Kaul et al. 1999). Since then, several authors such as Amartya Sen (1999), Peter-Tobias Stoll (2011), or Eric Brouseau (Brouseau et al. 2012) have explored the scope and limits of Global Public Goods from different disciplines and theoretical perspectives.

In addition to universal justice and international security, the list of Global Public Goods in the contemporary global society includes international peace, sustainable environment, cultural heritage, and global health, but also the stability of the international financial system, Information, and Knowledge. However, most of these goods cannot be considered pure or absolute Global Public Goods because they do not meet all three conditions mentioned above. The provision of most Global Public Goods is neither exclusively public nor exclusively private. More importantly, a large number of them only comply with one of the two first conditions (nonrivalry and nonexcludability). Among the vast group of impure or imperfect Global Public Goods it is possible to distinguish two different subgroups. The first one includes those whose consumption is nonrival, but excludable. Generally known as *Club Goods*, access to these goods is not rival for all members of the club but limited to them. This is the case of the military security and protection granted by NATO to all its member States, the economic benefits enjoyed by member States of regional trade agreements, or the advantages of the regional harmonization of trail transportation. The second group encompasses the so-called *Common Goods*: goods whose consumption is nonexcludable but rival. Access to these goods is open to all actors, but their consumption may eventually lead to their exhaustion. This is the case of the geostationary orbit: all countries can make use of it, but a sustained abuse of its capacity endangers its viability in the medium run.

The provision of Global Public Goods also differs from that of Global Private Goods or Public Goods. Global Private Goods are generally provided by private markets and tend to be guaranteed because of the economic returns they yield. In contrast, Public Goods – especially those with limited or no economic returns – are frequently the result of governmental strategies. The provision of Global Public Goods usually involves a plethora of different public and private actors and adopts several forms or models. (see, among others, the words of Kaul and Conceição, 2006, and United Nations Industrial Development Organisation, 2008). From this point of view, the public nature of Global Public Goods is not determined by their public provision, but by their public enjoyment. Some Global Public Goods such as pharmaceuticals or Internet are mostly provided by private nongovernmental actors, but they now play a key role in global affairs and access to them is gradually becoming less exclusive and rival. The participation of several actors in the production and provision of Global Public Goods has led Inge Kaul, Isabelle Grinberg, and Marc Stern to refer to them as multistakeholder goods (Kaul et al. 1999). Going one step beyond, Ravi Kanbur, Todd Sandler, and Kevin Morrison have suggested that it is possible to distinguish four different categories of Global Public Goods according to the so-called *aggregation technology*, that is, the relationship between the individual contribution of each actor and their overall

level of provision (Kanbur et al. 1999). The prevalent category is that of *Simple Summation Global Public Goods*, the provision of which is characterized by summation: each of the units contributed to a particular Global Public Good by an actor adds equally to the overall level of the good. This is the case of the reduction of each State's $CO_2$ emissions to the atmosphere. The second category comprises *Best-Shot Global Public Goods*, where the overall provision of the good equals the most-significant or largest individual contribution. The discovery of a vaccine or a medical cure for a global disease that is made available to several or all countries offers a very illustrative example of this category. The third category is less common and encompasses those goods that are produced through an aggregation technology where the overall level of a particular Global Public Good equals the smallest individual contribution. An example of these *Weakest-link Global Public Goods* is the control of a pandemic disease such as Ebola: the effectiveness of this control at the global level is very much determined by the country that shows the smallest capacity to address the challenge. Finally, the fourth category includes *Weighted-Sum Global Public Goods*, that is, those goods where each of the units provided by a particular actor does not equally contribute to the overall level of provision. All units make a positive contribution, but their weight varies. As a result, those actors who make the most significant contributions tend to benefit more from the existence of this type of Global Public Good. The individual contributions of States to a cleaner environment illustrates this case: those States who make larger efforts to sustain a clean environment and those who are close to them generally benefit more from the positive impact of their efforts, whereas those who make very limited contributions and those close to them tend to suffer the negative consequences of the ineffective provision at the global level (i.e., suffering the damaging effects of acid rain).

Global Public Goods can be classified also in accordance with the main source and the manner in which they are provided (Kaul et al. 1999, 2003; Kaul 2016). This initial difference has important implications for global governance. *Natural Global Public Goods* are those that can be found in nature and whose provision does not require human intervention. The preservation and enhancement of these goods may in some cases benefit from or require some human action, but their emergence is not directly connected to the latter. The ozone layer and climate stability are two Global Public Goods that fall within this category. Resulting from natural processes, their preservation faces the challenge of excessive human pollution, thus constituting an important governance challenge. *Human-Produced Global Public Goods* include those goods that are produced through social or technological processes that require human intervention. This second group encompasses goods as diverse as Human Rights, the World Cultural Heritage, Internet or Knowledge whose existence is primarily induced by social action and/or agreement. In contrast with the first category, the main challenge confronting the global provision of this group of Global Public Goods is restricted access that hinders their global or universal scope. This restriction can be motivated by several factors such as governmental repression (Human Rights), lack of access (Knowledge or Internet), and artificial barriers or controls (World Cultural Heritage). *Global Public Goods resulting from Global Strategies* constitute a third group whose emergence is closely linked to the last wave of globalization. These goods find their roots in the transnational nature of many global challenges, the complex interdependence that informs interactions between international actors and the gradual crystallization of cosmopolitan values. Examples of this category include international peace, international security, global justice, financial stability, or global equity. The main challenge confronting these goods is the difficulties surrounding their provision: in many cases actors make only partial contributions, whereas in others their contribution is nonexistent.

Debates on the definition, scope, and typologies of Global Public Goods have paid special attention to their interaction with global social processes over the past two decades. This has led to a gradual consensus on the socially

constructed nature of Global Public Goods, which find their opposite extremes in the so-called Global Public Bads. Acknowledging the conditions of nonrivalry, nonexcludability, and international scope, this consensus puts emphasis on the importance of perceptions and presents Global Public Goods as those that are given public priority (Macintosh and Wuyts 2002). The consideration of some goods as global public ones results from the convergence of values and interests between the majority or a group of highly influential public and private actors and authorities. In turn, the socially constructed nature of Global Public Goods allows for the emergence of potential tensions between some of them. This may be the case between those connected to environmental protection and sustainable development and those others built around notions such as global economic welfare or international financial stability.

These debates run parallel to controversies regarding the effective provision of Global Public Goods. This is severely affected by three complementary, mutually reinforcing gaps. The jurisdictional gap refers to the clash between the global and transnational nature of the several issues and challenges involved in the definition, prioritization, and provision of Global Public Goods and the national scope of most decision-making schemes. Individual State perceptions and interests sometimes relinquish to global concerns, but more frequently than not the former prevail over the latter. The participation gap makes reference to the difficulty to include nongovernmental actors in international discussions and negotiations on the definition, prioritization, and provision of Global Public Goods. Most of the existing fora are intergovernmental or place States in a very privileged position. However, the effective realization of some Global Public Goods requires the implication of a large and diverse number of nongovernmental actors that frequently struggle to make their voices heard. Finally, the incentive gap alludes to the lack of specific material incentives for some actors to engage in international cooperation in order to guarantee the provision of certain Global Public Goods. This situation allows some actors to behave as free-riders, especially those who do not share a strong moral commitment towards certain Global Public Goods. Even though this gap affects all goods, its impact is particularly salient in those with nonexcludable consumption and with high costs. The relevance of these gaps cannot be understated. Moreover, as Inge Kaul (2013) has rightly pointed out, in the current context of intensified globalization their effects are exacerbated by factors such as the multilevel process that characterizes the provision of Global Public Goods, the persistent crucial role of domestic initiatives, the varying preferences across international actors, and the centrality of development in confronting the most pressing global challenges.

# Globalization and Corruption

Anil Hira[1], Martin J. Murillo[2] and Anna Kim[1]
[1]Simon Fraser University, Burnaby, BC, Canada
[2]University of Notre Dame, South Bend, IN, USA

## Synonyms

Breach of trust; Bribery; Crime; Crookedness; Exploitation; Extortion; Fraud; Graft; Malfeasance; Misrepresentation; Nepotism; Profiteering; Racket; Rent seeking; Skimming; Squeeze; Venality

## Definition

Corruption is most often defined as "the use of public office for the pursue of private gain" (Galtung et al. 2013). This reflects a contractual relationship between the state and its bureaucrats and more broadly between the state and its citizens (Ledeneva 2009; Hira 2016). However, corruption increasingly refers to any breach of trust, malfeasance of intended duty, or failure to deliver in both practice and spirit for any agreement when the purpose is the gain of just one of the parties. Thus, corruption can occur at all levels of governance and include public, private, or nonprofit actors. Corruption is sometimes divided between petty, everyday corruption, and corruption scandals that occur on a large scale. Corruption can involve a wide variety of activities, from bribery to nepotism to favoritism.

## Introduction

Corruption, or misuse of office and abrogation of duties for pecuniary gain, has been common to all human societies. The development of the idea of a common interest, and subsequently a neutral bureaucracy looking out for the best interests of society, in the West helped to solidify the idea that corruption is something that could be rooted out, or minimized, though it has proven to be an ongoing process. In the postcolonial era after World War II, attention naturally turned to reforming developing countries, where widespread abuse of public finances and offices has taken place. Besides the wastage and misallocation of resources, corruption corrodes public trust and the legitimacy of government while reducing long-term investment. Attempts to reproduce Western-style bureaucracies and accountability mechanisms, and the spread of democracy as well as extensive monitoring efforts through global indices, have brought attention to the problem, but yielded limited results. Both the indices and much of the literature around corruption seem to point out the obvious – that corruption in the West is lower than in the developing world (Treisman 2007). Consensus around a causal theory that would lead to a more comprehensive reform effort has been contentious around whether an economics or cultural approach makes more sense. There is the possibility to see overlap between the two approaches, leading to a more effective corruption reform strategy.

## Theories on Sources of Corruption (Kim and Hira)

There are two main approaches to understanding the sources of corruption, economic and anthropological. The economic approach emphasizes the possibilities that cost benefit analysis of cheating, that is, the costs of enforcement vs. the private gains from stealing or engaging in favoritism (Lambsdorff 2002). The anthropological approach looks more at cultural norms as a source of behavior, that is, formal bureaucracy may not reflect long-standing loyalties, traditions, and relationships that lead to corruption.

The dominant approach from economics has a deep and rich literature behind it and has informed most of the effort behind corruption reform. The ubiquitous term "rent seeking" was popularized by economist Anne Krueger in 1974. Rent seeking refers to the pursuit of individual or group private interest at the expense of public interests. It is often used to reflect the pursuit of gains by special interest groups and thus tied to campaign

finance. Economists also tie corruption to transactions costs, or the costs or creating a link between and buyer and a seller (Lambsdorff et al. 2005). Oldenburg thus defines corruption as "the exchange of money or favor for a benefit disbursed by government official" (Oldenburg 1987, p.512). Government officials have an inherent conflict of interest in that they are to put national interests above their own individual or agency ones.

More complicating still is the fact that many transactions involve information uncertainty on the part of one or more parties to the transaction (Akerlof 1970). On top of this possibility for asymmetric information and the accompanying imbalance in power (e.g., the seller of a used car) is the principal-agent problem which comes up when one hires an expert in a field to act on their behalf and/or provide a service, such as a lawyer. The essential challenge is how to evaluate the role and performance of the agent when one lacks the expertise, no more so than in government decisions. In parallel, a middleman or broker in a transaction may benefit unduly from both of these phenomena. The Coase theorem (1960) suggests that property rights hold a key to reducing corruption since they internalize all transactions under one actor, such as a corporation that provides a beginning to end production process. However, many public activities, such as regulating environmental pollution or national security, are not possible to privatize.

Economics suggests that reciprocity is the basis of long-term cooperation. Reciprocity leads toward a generalized notion of social trust, giving an individual an incentive to play by the rules so that he/she does not suffer from violations. Thus, economists have a strong explanation as why both good and bad practices of corruption tend to be self-reinforcing. Repeated transactions and the need for transparency thus form the foundation for institutions, or organizations which bear and enforce rules of behavior for collective action.

It is hard to tell what role politics has on corruption. Though the general consensus is that vibrant democracies should be less corrupt (Treisman 2007), recent work on corrupt democracies such as India belies any simplistic notions (Riley and Roy 2016). There is contention about what types and activities of democracy reduce corruption. For example, Brunetti and Weder (2003) argue that the freedom of press is particularly important to expose corrupt officials and as a result will lead to the lower corruption over time. Kunicová and Rose-Ackerman (2005) claim that presidential systems have higher perceived corruption compared to their parliamentary counterparts.

From the cultural perspective, corruption reflects deeply embedded values and relationships. For example, some authors claim that power distance is a cultural value, reflecting the degree of tolerance from public and number of checks and balances against the abuse of power. In more egalitarian societies such as those in Scandinavia, therefore there is less corruption than in more unequal societies such as India and China (Hofstede and Hofstede 2005). However, those who study culture approach corruption in a very different way. Corruption is often viewed as a Western lens which unfairly judges developing societies (Torsello 2014). Authors such as Blundo (2007) therefore suggest studying culture as a reflection of more informal and less acknowledged cultural practices. Corruption is therefore understood as emanating from a clash between formal (Western) institutions and traditional ones based on more informal and less recognized personal networks. Such networks include long-term personal relationships which allow individuals to deal as a group with formal institutions and avoid uncertainty in an environment of scarcity through information exchange, political support, and bureaucratic favors (Lomnitz and Sheinbaum 2004; Jancsics 2014). Such networks can be found all around the world: in America it is called *pull*, in Russia *blat*, in Latin America *compadrazgo*, in Israel *protexia*, in Mexico *palanca*, and in China *guanchi* (Lomnitz 2004). Thus nepotism is not seen in the same negative light as it is in the West (Jaskiewicz 2013). The networks may also be vertical in the sense of a patron bestowing favors upon a client in exchange for loyalty or long-term debts (Boissevain 1989; Campbell 1989; Jackall 2010, pp. 18–44). Thus much of the formal movement toward democracy,

even in the West, covers up patron-client activity that tends to elicit corruption.

The general approach coming from economics that has informed most corruption reform efforts is to increase penalties, transparency of transactions and regulations, and set up oversight agencies to examine transactions. The transactions approach is embraced by the leading global actors on corruption reform such as Transparency International and the World Bank. While there have been improvements in general awareness, there is no real sign of general shifts away from corruption globally. Therefore, new studies call for some combination of the two approaches, recognizing and seeking to change and merge informal and formal approaches to corruption reform (Hira 2016).

## History of Corruption and Attempts to Fight It in the West (Hira)

If the West is the model to follow, how did it establish "clean" government? We can begin our review of the history of corruption in the West in a counterintuitive way: since corruption has been around since the beginning of time, the more interesting question is what are the roots of anti-corruption efforts? Along the lines of cultural approaches to corruption, it is still important to point out that anti-corruption has its roots in Western ideas around morality. Corruption in its broadest sense is any violation of accepted morality. In the West, the sources of morality are most proximately Judeo-Christian traditions, particularly the notion of sin. The most primordial story of the Garden of Eden is based on the devil's lies. Corruption was historically tied to sin through a sense of uncleanliness, a violation of purity through dishonesty, which then made everything else metaphorically unclean and diseased (Bayless 2012). This helps to explain why we have an instinctively repugnant response to even petty corruption in the West, which is much harder to observe elsewhere. We essentially see corruption as an individual failing and breach of trust. The breach of trust is exacerbated when such violations take place in the public sector, which has additionally packed in notions of social, public, and collective responsibility. Arguably, then, in the West, proscriptions against corruption are much stronger due to the overlap of both individual and social implications in public activities, whereas in more corrupt societies, there is a perceived long-standing breach between an individual bureaucrat's and public interests. Thus, ironically it is the focus on individual responsibility, regardless of context, in the West that allows for a strong sense of responsibility, whereas in societies which are more group-oriented, it is more understandable for an individual to take care of their clan or extended family before taking care of their public responsibility.

We can see in the West, therefore, that the justice and legal systems are built around the broader notion of dealing with moral violations. "The rule of law," whereby the law is above individual interests and decisions, is a key concept that enshrines moral codes into a standing set of reified rules, a phenomenon rarely found in the developing world. The concept has deep roots in Greek and Roman history. In terms of corruption, these are embedded in the well-accepted principles of codes of conduct, conflicts of interest, independent judicial and regulatory review, and whistleblowing, along with the overriding one of due process in investigating purported violations (Miller et al. 2005). Such notions were developed and supported during medieval times by the idea that even rulers were subject to God's law (Møller and Skaaning 2014, 131). Underlying these systems are the deeply embedded beliefs that the ends does not justify the means, the need for stable rules of behavior, above all for honesty. This is not to say that other societies are a- or immoral, only that their notions of corruption in practice do not match those of the West. In times where behavior in the West deviates from such guidelines, a correction inevitably ensues. For example, the turn of the twentieth century in the USA is sometimes looked upon fondly in terms of the machine politics of the big cities like Chicago or New York, where votes and contracts were frequently bought off from recent and often illiterate immigrants; however, the violence of the prohibition (with parallels in narco-trafficking today) era

demonstrated the problem that allowing the breaking of rules in one area of society would spill over into others and that social norms had to support the rules.

Corruption does occur in the contemporary West, as stories from cost overruns in Afghanistan by US defense contractors to the massive scandal around FIFA abound. Large parts of southern Italy are rife with extortion payoffs and control of certain subsectors of production by illegal groups. It is more the perception and pervasiveness of corruption that varies. In the West, most everyday transactions are generally stable and predictable, whereas in the developing world, they are more prone to changing conditions. The best examples of that are the regular and peaceful succession of governmental change after a fair election and the independent role of law enforcement and the judiciary, both things often lacking in the developing world. It bears examining, therefore, how the West developed the notions of corruption that it is now attempting to universalize.

It would be difficult to retrace the exact steps of the evolutionary process in the West that led to less corrupt bureaucracies. Nield (2002, 12) links it to the rivalry among European states, whereby efficiency and stability in the public administration supported military success. The foundation of Western notions of propriety relate to the rule of law, property rights, and the development of the Weberian bureaucracy. All of these can be seen as parts of the overall context of accountability by election and by checks and balances among branches of government. Behind these is the concept of a public interest that supersedes that of any individual or group, with the government as the embodiment of it.

The idea of the rule of law is designed not only to set up orderly and acceptable conduct in public administration, but also to give a sense of confidence to the population at large in terms of equal and fair treatment under transparent rules of behavior. The rule of law is much more forceful than enacting law. As the cases of Latin America and Russia attest, enforcement and the spirit of the law are equally important to having a legal code.

Property rights figure large in most accounts of Western propriety. Property rights are in essence contractual boundaries for ownership of the benefits deriving from a piece of land, business, etc., that are ultimately enforced by the state. Property rights are thus essential to the free trade/exchange of assets in a reliable fashion. Tying into the monetary system, valuations of them, and the ability to exchange property, goods, and services for financial reward is the heart of the capitalist system allowing for accumulation and long-term investment.

Behind these systems is the public bureaucracy. The modern Western bureaucracy is generally traced to developments in Western Europe around 1790–1850. Within the next 100 years, many of the attributes of a modern bureaucracy, including functional divisions and task allocation, nonpolitical personnel no longer appointed by sale of offices, ranking systems, and professional pay and pension systems developed (Raadschelders and Rutgers 1996, 75–80).

Weber's (1978) notion of advanced bureaucracy is central to Western propriety. Weber posited that traditional cultural systems would give way over time to a modern state where a merit-based neutral bureaucracy with strict rules on conflicts of interest and separate, stable budgets would make decisions in the best interests of society. This approach still represents our ideal view of the principles behind bureaucracies, though practices vary considerably. Yet, in practice, most Western bureaucracies are mixed systems, whereby political appointments occur at the highest levels (e.g., ministers or ambassadors), and merit-based hiring should take place at the lower levels. In some cases, such as local prosecutors or judges, there is a direct election. Historically, there has been a continual tension between these two systems, the first derided as the "spoils system," a term popularized by appointments under US Pres. Andrew Jackson of his cronies to high positions. A related area of ongoing tension is public procurement. The Western principle is that public contracts should be awarded in a public competition with the criteria clearly known. The development of auditors, whistleblowers, and transparency for public contracts reflects an ongoing concern. A more recent addition to accountability agents is the Ombudsmen, an office that

hears public complaints about corruption or poor service directly. In essence, such efforts are bound to be limited because of (a) the levels of expertise required to understand and weigh the different aspects of different proposals, (b) the number of contractors who can deliver on many contracts is bound to be limited and subject to collusion, and (c) the possibility of hijacking or otherwise marginalizing the accountability efforts. A perfect example of the latter is the conflict of interest that occurred by ratings agencies for junk US housing derivatives leading up to the 2008 financial crisis. The agencies had a basic conflict of interest because they wanted ongoing contracts from the issuers of the bonds (Hira 2015). What is underplayed in many discussions due to the prominence of the economics approach is the culture of bureaucracy in the West. Not only formal codes of conduct but a genuine spirit of public service abounds in Western bureaucracies.

The last piece for understanding Western approaches to corruption derives from the notion of checks and balances (Montesquieu 1748). This is often called "horizontal" accountability as opposed to the vertical accountability manifested through elections or appointments (where the supervisor has responsibility). The checks and balances approaches reflect the enshrinement of law enforcement and judicial independence. Along with that is the idea of overlapping roles, such as the need for the executive to propose budgets and the legislature to approve them. The overlap draws back to the basic history of democratic development in the West whereby European kings relied upon aristocratic landholding families in the Middle Ages to finance wars. This was the original source of power for a separate legislative branch as enshrined in the Magna Carta. Eventually, this evolved into the enshrined principle that the king should be accountable to oversight by the legislature and, over time, toward elected government. Elections are still considered the ultimate source of accountability. Perhaps an equally important role is played by the media, to uncover stories of corruption. The role of investigative journalism works hand in hand to allow whistleblowers access to a wider audience, as in the famous case of "Deep Throat" who revealed the Watergate scandal that was tied to US Pres. Nixon in the 1970s.

We see, then, that democracy itself is pervaded by the idea of accountability. Where transparency breaks down, such as the lack of oversight on privacy of security gathering of personal information following the 9/11 terrorist attack in the US, scepticism and distrust of government starts to creep in, undermining its effectiveness. The importance of values is underscored by noting that even when rules are not violated, violations of the spirit of propriety are quite serious. A contemporary example is the row over campaign donations by ultra-wealthy individuals in the US currently. While such notions are common throughout the West, the level of tolerance of violations varies greatly over time and space. In Canada, for example, Québec has a reputation for questionable public contracts. Propriety seems to break down often when Western companies work overseas as we discuss in the section on development and corruption. The boundaries of corruption are not as easy to discern in the West, then, as is commonly portrayed. The example of the Wikileaks scandal whereby a number of embarrassing classified communications were hacked and released publically demonstrates that there are still limits and controversy around transparency and accountability in the public sector.

Growing scepticism in the West about the role of government from the 1980s led to a series of reform movements which are discussed in detail in other sections of this volume. The first is called the New Public Management (NPM). NPM seeks to increase accountability by emphasizing a market approach to public services, where private providers can provide the service they are preferred. If not, the government should act like a private firm in terms of developing measures of performance, from setting up competition among providers to objective measures such as waiting times to allowing citizens ("clients") to evaluate the service. Government agencies may even compete against each other. The second is the whole-of-government approach which sees government agencies as too fragmented and lacking in communication across functional areas, in distinction with the separation of powers tradition. It sets up

integrated tasks forces and other means to improve integration and coordination. It is still too early to tell whether such reforms will make any dent on corruption, but there are reasons to be sceptical. While the NPM is helpful in creating a sense of performance, there are many functions outside of routine mundane functions, such as providing drivers' licenses that are difficult to measure. Horizontal efforts go against a variety of systems including recruitment that are designed to build functional specialization along vertical lines.

The history of corruption in the West is ongoing rather than resolved. While the West has relatively strong accountability and normative systems that reduce levels of corruption, we should be very cautious about finding solutions, or replicating systems that developed over hundreds of years in individual national circumstances. Ongoing scandals show that accountability systems must evolve over time as well.

## Global Measurements of Corruption (Murillo)

The measurement of corruption is a particular area of interest related to the need to map out corruption as part of general reform efforts. Quantitative approaches to tracking corruption allow cross-country comparison over time. These, in turn, have important and profound decisions on global economic transactions, particularly investment flows. However, the measurement of corruption has been an area of disagreement between stakeholders from different fields. The plethora of methodologies, measurement instruments, and indices represent in turn different conceptualizations of corruption. This section elaborates on three ways to measure corruption: surveys, expert assessments, and composite indices.

### Representative Surveys of Service Users

Measurement of corruption through nationally representative opinion surveys is a common method to assess corruption levels in a nation. The two general types are private sector (business) surveys and general population surveys. Nationally representative surveys of firms or households provide a good insight of apparent corrupt practices in the provision of government services to the citizen. The samples range from randomized general population samples to surveys of the private sector and segments of the public administration. The size and nature of the samples has varied considerably.

Private sector-led surveys measure only corrupt transactions happening between public officials and business firms. For instance, they enquire about bribes paid in tax collection or in business licensing and also identify the types of firms pay more in bribes. Business people are frequently surveyed since they are thought to be knowledgeable in this field (Knack 2006).

Overall, these types of surveys provide a specific corruption measure that can be used to shed light on aspects of corruption that are not emphasized by the more broad perception-based indicators, which focus primarily on administrative corruption.

Among the many private sector surveys, two large surveys are the World Bank Enterprise Surveys and WEF's Executive Opinion Survey. Both are parts of broader surveys of an economy's private sector. World Bank Enterprise Surveys capture the prevalence of different types of bribery in 135 countries. The results are based on surveys of more than 130,000 firms. The Enterprise Survey is carried out through face-to-face interviews with firm managers and owners regarding the business environment in their countries and the productivity of their firms. Corruption is one of the topics covered through questions on bribes paid for different government services and processes. Other topics include infrastructure, trade, finance, regulations, taxes and business licensing, crime and informality, finance, innovation, labor, and perceptions about obstacles to doing business (WB 2015). The World Economic Forum's (WEF) Executive Opinion Survey also has corruption as one of its topics. The survey is applied to a sample of firm managers in most nations of the world. Ratings are computed as the simple average of all executives' responses (Knack 2006).

### Citizen Surveys

There are a plethora of household surveys that address corruption issues. Some surveys are entirely focused to corruption, while others explore a wide gamma of variables, corruption being one of them. Each of them differs on the nations covered, the methodology utilized, and the sample characteristics.

Transparency International's Global Corruption Barometer (GCB) is an annual opinion survey of approximately 1000 people from each of 107 countries (for the sample taken from Sep. 2012–Mar. 2013) that tracks public opinion on corruption. Administered to a representative sample of the population, it addresses people's direct experiences with bribery and details their views on corruption in the main institutions in their countries. The survey also provides insights into how willing and ready people are to act to stop corruption. The survey is administered face to face in local languages, through computer-assisted telephone interviewing or online, depending on the country context (Hardoon and Heinrich 2013).

The World Values Surveys (WVS) is carried out by professional survey organizations, using face-to-face interviews. All national samples were drawn from the residential population of 18 years and older and have a minimum sample size of 1000 individuals. In most countries, some form of stratified multistage random sampling was used to obtain representative national samples. In the first stage, a random selection of sampling points was made based on the given society's statistical regions, districts, census units, election sections, electoral registers or voting stations, and central population registers. In most countries, the population size and/or degree of urbanization of these primary sampling units (PSUs) were taken into account. In the second stage, the list of addresses within each PSU was chosen using standard random route procedures. In the third stage, various methods were used to select respondents within households. In most countries, substitution of respondents was allowed (Kravtsova et al. 2014).

Another survey is Gallup International Voice of the People. As in the WVS, corruption is one of the many topics of the survey questions. The survey is conducted in 59 countries, with an approximate minimal sample size of 500 per country. Wherever possible, within each country a nationally representative sample of 500 adults, male and female, aged 18 years and over is used. In some emergent countries, where such research conditions are not possible, there may be stated variations to this (e.g., urban areas only). Similarly, in the developed world, interviews were conducted by telephone, while in emergent and underdeveloped countries, face-to-face interviews were conducted (Gallup 2012).

Similar types of surveys are International Crime Victim Surveys, New Democracy Barometer, Afrobarometer, Asia Barometer, Latinobarometer, and many others. These are characterized by focusing on different world geographies and economies and by having corruption only a part of the survey (Knack 2006).

### Expert Assessments

In contrast to citizen surveys, expert assessments are surveys given to a network of correspondents with country-specific expertise. Given the nature of the data sources, these assessments of corruption have been most widely used for comparisons across countries and over time.

These assessments differ in various aspects that can have important impacts on the survey results. For instance, they generally focus on specific geographical or economical regions, thus providing limited number of nations. They also differ in how the surveys are managed and processed. For instance, some surveys are very centralized approaches, with final ratings being determined by a very small number of people from views of a network of correspondents with country-specific expertise. Others follow a more decentralized approach where final ratings are directly determined from experts with experience in different countries. A hybrid version utilizes regional hubs in order that process information.

These assessments also differ on how transparent is their methodology and whether they have clear definitions of the various concepts. While some indices provide detailed documentation and qualitative details, others provide little

documentation, which raises important questions in regards to the nature of its data source and the rationale of the choice of the different parameters (Knack 2006).
